J. H. Lounsbury, of Hartford, succeeded Mr. Fairchild, and, after managing the office satisfactorily for two weeks, resigned to accept the management of the Hartford (Conn.) office, vice G. B. Hubbell, resigned. His successor at New Haven will be W. A. Harris, for many years manager of the W. U. office at Bridgeport, and a very popular man. Manager E. Ryder, of Meriden, will be transferred to Bridgeport, and Mr. J. W. Copeland, of Rutland, Vt., will succeed him. E. A. Stevens, operator W. U., has resigned, and will go with the A. U., New York. The present force at the W. U. consists of Fred Fairchild, chief; W. P. Weaver, Associated Press leased wire; L. H. Hart, New York quad; J. M. Howard, Boston and way; T. F. Ford and E. A. Stevens, way; J. F. Malone, N. A. P., nights; A. Osborn Bailey, chief clerk; A. J. Bailey, delivery clerk; E. F. Gorham, entering clerk; Union Depot, B. Dexter Hubbard and A. P. Foley; Church street Branch, Julius Cramer; American Rapid, A. L. Page, manager; Mr. Megner, chief operator, with a force of performers and type writer.

Business lively at all offices.

The Continental will probably open here July 1.

### Lake Shore Items.

To the Editor of The Operator:

SIR: The following from a recent issue of the Erie (Pa.) Graphic, presumably from the pen of Mr. E. P. Clohessy, of Silver Creek (N. Y.) office, may be of interest to some of your readers:

"The old clock in the Silver Creek telegraph office is rather a historical curiosity in its way. On the face of this clock, and on the inside of the door, are written the names, with month and year opposite, of nearly every telegraph operator who ever worked in the office; some of the names have become so obliterated as to make it almost impossible to read them. Among many others are the following: Tom Goalding, 1855; Tom Cryan, '58; Carl Gifford, '62; C. D. Wyman and Dewitt Clinton Swartz, '64; W. Van Duzer and Geo. P. Gaston, '65; F. N. Beach, '66; C. E. Miles, '67; T. W. Niles and W. H. Smith, '68. Many good stories could be told about these veteran telegraphers. Many of these Knights of the Key we have long since lost track of, and some have become successful in other fields. George P. Gaston is now a prominent merchant of our own town, and can tell many funny stories of 'ye olden times.' Wm. Van Duzer, who was a celebrated train dispatcher at the time he worked in this office, is now one of the oldest and most successful engineers on the Lake Shore Road. Telegraphy still has a fascination for T. W. Niles, who is now and has for many years held the responsible position as train dispatcher in Buffalo, and it can truthfully be said of Tracy that he is the right man in the right place."

Mr. Clohessy, who is at present manager of Silver Creek office, is a thorough telegrapher, and well worthy to fill the position graced by his distinguished predecessors.

Mr. E. C. Faircloth, the popular operator at Erie, Pa., depot, is making an extended tour of the East, T. Murray, of Harbor Creek, relieving him. J. Walker, of Angola, N. Y., is working the "last hours" at Dunkirk, N. Y. "Bob" Kinney has been transferred from Brocton, N. Y., to Lake View, N. Y., night office, Will Ryan, of Dunkirk, going to Brocton. We had

the pleasure of meeting Mr. Wood, manager of Fairview, Pa., office, recently, who is a very pleasant and entertaining gentleman.

EASTERN DIVISION.

Hamburg, N. Y., June 5, 1881.

### Western Division A., T. & Santa Fe R. R.

To the Editor of The Operator:

SIR: On the western division A., T. & Santa Fe R. R., at La Junta, Col., we have M. P. Doolley, chief dispatcher; T. J. Guinn, formerly of W. U., Buffalo, second dispatcher; C. W. King, third dispatcher; J. F. Howell, F. L. Myers and H. D. Ward, operators; W. A. Sharp, an old-time operator, is superintendent's clerk. W. S. Whiter, formerly assistant chief dispatcher, this office, has resigned to accept a more lucrative position in the office of chief engineer of the company at Las Vegas, New Mexico.

The following list of operators constitute our efficient main line corps, and a more congenial and obliging lot of boys were never congregated upon one clothes line:

B. F. Smith, of Minneapolis, also Al. Wright, an old-timer, and for several years a dispatcher on the Balto. & Ohio Ry., are running trains here. Fred. L. Cowles is operator at Pueblo, Col.; Henry Spahr is at Thatcher, P. J. Flynn is agent; A. F. Schumann works days and W. P. Clark nights, and Miss R. L. Boyles is manager of the W. U. Tel. Co. at Trinidad, Col.; E. M. Watson is at Morley, D. A. Wilkison at North Siding, G. A. Bross at Raton, N. M.; C. E. Harney at Otero, N. M.; J. W. McCoach at Springer, and J. D. Bruner at Watrous.

Roy Thompson is at Sterling, Kan.; J. B. Daniels at Raymond, Kan.; L. S. Clark at Ellinwood, F. M. Burson at Great Bend, J. M. Vanaken at Pawnee Rock, J. R. Thomas at Larned, H. F. A. Wheelihan at Kinsley, A. E. Teed at Offerle, A. Kingkade at Spearville, L. L. Angell at Cimarron, Jas. O. Heron at Pierceville, J. H. Waterman at Lakin, C. H. Logan at Syracuse; L. F. Gault, days, and F. L. Strickland, owl, at Sargent; C. L. Wheeler, days, and G. L. Armstrong, owl, at Granada; G. W. Wrightman, days, and G. W. Holloway, owl, at Prowers, and D. J. Lindsey at Las Animas.

LA JUNTA, Col., June 8, 1881.

### Telephonic Phenomenon.

To the Editor of The Operator:

SIR: I send you a very singular occurrence which happened here some time ago, as related to me by an operator who was here at the time.

We had connecting the office with a house an acoustic telephone, put up in the usual manner, by being insulated at each end, the small wire running direct to the diaphragm, and suspended at the supports by the usual twine loop. One afternoon, during a very hard hail storm, the hailstones falling very rapidly and of considerable size, I was attracted to the telephone by a loud sound, and thinking some one at the house was calling, I stepped over to the instrument to answer. I had a large meerschaum pipe in my hand at the time, holding it by the bowl, and as I was about to answer, I brought the amber mouth-piece of the pipe nearly in contact with the small wire. Instantly a discharge took place. A steady stream, or a regular voltaic arc, formed, igniting the amber, but I felt no shock. I drew my hand away, finding the amber partly burned. I then tried a piece of clip paper, holding it near the wire, when instantly it took fire with a report similar to the discharge of a Leyden jar. I felt considerable shock this time. Thinking that the wire had become crossed with the San Francisco and Portland wires, I examined it, but found it all right, and that in no way could it have short circuited the large main batteries in the battery-room. Still, to verify it further, I found that a telephone across the street was similarly affected.

Now, as to the cause of this singular disturbance: It did not seem to be atmospheric, as no indication of that condition was manifested on the Morse instruments. Was it frictional, produced by the rapidly-falling hailstones on the wire? Or was it the discharging of each hailstone, charged with a high positive potential from the upper atmosphere, as it came in contact with the wire? The wire being of some length and insulated at supports by dry twine, and as no rain fell with the hail, may have acted

as a condenser, which, by the rapidly-falling hailstones discharging themselves, kept itself charged, and on bringing my hand near the wire discharged itself, thus establishing an equilibrium of the opposite tensions. Its very high potential showed it to be static electricity. This natural condenser lasted as long as it hailed but no longer. C. L. H.

YREKA, CAL., April 15, 1881.

#### Another Tired Manager.

To the Editor of The Operator:

SIR: In reply to the highly improbable statement of your correspondent "Tired," of a few issues ago, asking as to the time operators were made to work, I think that his statement was an easy one as compared with what our W. U. friends, Messrs. N. J. Petrich and T. W. Milburn, of the W. U. here, have to do, both in hours and in labor. The manager opens the office at 5.34 A. M. for signals, and the office is not closed until 2.30 A. M. following, and oftentimes even later, 2 1/2 hours operating work straight, but from 8 to 10 P. M. both are at work, making the day solid. Further, the manager has no clerk, but keeps his own books. They are the best worked men that I know of, and inform me that no extra pay is allowed them, although allowed everywhere else. They handle Associated Press, have an interminable string of specials to send, and even more to receive, as we have a live, enterprising *Daily Express*—which is bidding fair to rival the celebrated *Galveston News* in the shape of telegrams—and endless reds.

ALAMO.

SAN ANTONIO, Texas, June 8, 1881.

#### Milwaukee Melange.

To the Editor of The Operator:

SIR: Regarding the expected changes at 89 Michigan, nothing definite can be learned at this time. It is generally surmised, however, that Mr. E. M. Shape, of the Western Union, will be placed in charge of the combined forces. There will probably be many changes of positions among the force, but that it can be materially reduced without detriment to the service is improbable, and consequently such result is not looked for. The rumor that Mr. W. H. Kelsey, manager of the Telephone Exchange, was to be put in command is authoritatively contradicted.

Mr. E. J. Peabody, late manager of the American Union, is also spoken of for some prominent position, just what does not appear, though probably a Western superintendency.

From Minneapolis comes the announcement that Mr. J. W. Booth, formerly manager A. U., in that city, has been appointed manager, to succeed Mr. L. R. Robertson. Nothing is known regarding St. Paul office.

Mr. O. C. Wells, formerly of the W. U., this city, is now working in Chicago.

OCTOPUS.

#### Burlington (Iowa) Notes.

To the Editor of The Operator:

SIR: On the first of March Mr. A. C. Man, ex-Manager of the A. U. Co., relieved Manager Ludwig of the W. U. Mr. Man is an old and experienced W. U. operator and is well qualified for the place. The day force consists of the two Heldorfer Brothers, Messrs. George and Tony, assisted by Mr. Adam Greoltz. Mr. Fred E. Keene is night manager, and takes the N. W. press. Mr. S. C. Courtright keeps the books in fine shape, and also keeps the boys in good spirits by his unlimited good nature and puns.

JOSH.

#### Albany (N. Y.) Notes.

To the Editor of The Operator:

SIR: We, that is, the "gentlemanly operators" of Albany, have been groaning under a sense of importance ever since Ex-Senator Conkling and "me too" have kicked up such a rumpus, and we take a kind of fiendish delight in having copy enough to make the boys in the country towns of New York, Boston, Chicago, Buffalo and Cleveland exclaim: "Sa hw mh more u got." Of course, we are asked a thousand times a day, from the still more rural offices: "What was the ballot to-day?" but we haven't time to vouchsafe any other reply (or one that is any nearer the truth) than: "Dnt no."

Our force has increased somewhat since the 20th ult. The genial and artistic "old timer," Putnam, is with us. So also, *pro tem*, is A. A. Wiley, of "135," who manipulates either side of the N. Y. quad with ease; likewise C. E. Davis, also *pro tem*, from "135."

Business is waxing hotter and hotter; consequently, the sum total of "extra" grows larger. But as this is not a business letter, I'll "let up."

C. M. SMOTHER EVE.

### TELEPHONE DEPARTMENT.

The school-houses of Rochester, this State, are furnished with telephones, at an annual cost of \$800.

In the Russian language "hello" is rendered "Tzijakanfitkranjanjanski," hence the unpopularity of the telephone in Russia.

Prof. Strong, of Chicago, claims to have recently discovered a practical method of transmitting and receiving telephonic messages through non-insulated wires placed in lakes or rivers.

Prof. Dolbear, of Tuft's College, one of the original inventors of the telephone, whose rights were bought by the Western Union Telegraph Company, has now invented an entirely new telephone, through which it is claimed conversation can be heard over any length of wire.

The United Telephone Company is extending its operations all over England. It has about 5,000 subscribers in the United Kingdom, but is now pushing its business very rapidly, having convinced the British public of the immense utility of the telephone for commercial purposes.

The narrowness of the principle and the great pecuniary interests involved in the discovery of the telephone have given rise to much litigation. At the Patent Office it is said that up to the present time about 250 different patents for telephones have been granted. A short time ago there were 55 cases of alleged interference in telephone patents before the office.

Admitting that the winds cause shock-like vibrations in telephonic lines of communication, and so disturb at times the distinctness of messages transmitted, M. A. Graiffe thinks that a remedy for such perturbations can be found by causing the telephones to speak by electric action of sufficient power to completely subdue accidental currents produced in the wires.

It takes nerve and patience and good temper to make a good telephone operator, and those who lack any one of these essentials had better let the profession alone. Only one person out of five on the average has a good telephone voice. They speak too low or too loud. Not more than one person out of twenty has the voice which a telephone operator should have—pleasant, even, plain and devoid of peculiarities. Let one of the best operators talk to you over twenty miles of wire and you will fancy that he stands beside you.—*Free Press*.

The telephone nearly scared the wits out of Secretary of State Blaine the other day. Senator Conger, of Michigan, called at Mr. Blaine's house, but as the latter was then at the State Department his servant announced Mr. Conger's arrival over the telephone. The streak of blue fire that came back over that circuit, and the stray repetitions of Mr. Blaine's old speech about singed cats, turkey-cocks, etc., were only accounted for when it was learned that Mr. Blaine understood the telephone to say that Mr. Conkling was at his house.

Mr. Church, Secretary of the Japanese Consulate of this city, is lying at his home in Passaic in a dangerous condition. He was out driving with his wife and her father and mother on Decoration Day. As they were returning from Newark on the Boulevard they were struck by a telephone wire hanging over the road near Grand street. Mr. Church was thrown from the carriage and landed on his head. Mrs. Clemons, his mother-in-law, was caught under the chin by the wire. Her jawbone and several teeth were broken and her face cut and bruised. She is confined to her room. Captain J. W. Clemons, who has a place of business in Ann street, had his eye injured.

The American Bell Telephone Company, of Boston, has brought suit in the United States Court in Brooklyn against the Metropolitan Tele-

phone Company, the Brooklyn Central Telegraph Company and seventeen defendants who live in Brooklyn, for an alleged infringement upon its patent. The complaint sets forth that Alexander G. Bell, of Massachusetts, was granted letters patent on March 7, 1876, for a new and useful improvement in telegraphy. These were assigned on the 22d of June, 1880. There are now 100,000 electric speaking telephones in use, and but for the alleged wrongful acts of the defendants it is alleged the plaintiff would have enjoyed the sale and exclusive right to use this invention. The defendants, the complaint avers, have jointly made, sold and used telephones embracing inventions secured to the plaintiff.

Referring to the transmission of church service by telephone, Mr. W. J. Jenks, Superintendent of the Brockton (Mass.) Exchange, writes: "I had the pleasure of experimenting in May, 1878, with the first Blake transmitter which ever went out of the American Bell Company's factory at 109 Court street, Boston, for a test of this kind, and locating it at the Brockton Opera-house, gave to some twenty or twenty-five stations about town a satisfactory rendering of the cantata of "Queen Esther" by a chorus of over one hundred voices. The instrument was somewhat larger than the pattern since adopted and now in general use, and was, for this initial trial here, attached to a beam some fifteen feet above the stage, in a slanting position, the opening downward. The choruses were especially fine, and even the solos were distinctly understood. For more than a year after this time a transmitter was regularly used at all entertainments here until the growing business of the Exchange obliged us to discontinue it. For two years past musical entertainments have been superceded by church services, the best place for the transmitter being found to be directly in front of the speaker, and firmly fixed upon a bracket on the desk. Carefully adjusted, with two cups of Calaud battery attached, we have secured really surprising results, frequently connecting six to fifteen circuits, carrying from four to ten subscribers each, and enabled from thirty to fifty persons to listen at once. Yesterday, for a test of the lines just completed to Boston and Taunton, these two cities were connected with the First and Porter Congregational churches successively. Rev. H. L. Kelsey, of this city, and Rev. Mr. Julian, of New Bedford, gave discourses which were listened to by interested officials and operators in Boston, Salem, Newburyport, Gloucester, Taunton, Fall River, New Bedford and Providence, these points being simultaneously connected. The music, from the farther extremity of the church in each case, was highly enjoyed.

### DASHES HERE AND THERE.

Edison has now told a reporter that he expects to light the whole of this city in two years and a half.

Can any one tell about how much of the portable battery, or bottled electricity, is equal to a demijohn of Jersey lightning?

By and by, when the Mutual gets under way, the mushroom Continental will become materialized, with the old specialty, "reduced rates," at its mast head.

The report of the superintendent of the U. S. Electric Lighting Company shows that more orders for machines and lamps have been received than can be filled during the next six months.

Messrs. Davis & Watts, in a change in their advertisement in this issue, offer a lot of handsome nickel-plated bells at less than cost of manufacture. See their advertisement, last page.

Only one telegraph line is in operation in China, from Shanghai to Woosung, twelve miles. An effort is now being made to extend the wires to Tientsin, but the native mandarins are opposed.

The trial of the electric light in Saratoga Springs proved a great success the other night. The lamps gave an even and brilliant light, and the test may be regarded as determining the adoption of it there.

Messrs. L. G. Tillotson & Co. have a handsome display of annunciators, burglar alarms, wall bells, push buttons, etc., in our advertising columns to-day, which will prove of interest to many of our readers.

A report comes from Denmark that a watch-maker at Copenhagen has invented an electric watch of ordinary size, which is operated by a miniature battery that requires replenishing only once in six months.

It is now intended, if possible, to run trains on the railroad through the St. Gothard Tunnel by electricity, which is to be produced by the machines now employed in pumping air into the workings and for other purposes.

Sir William Thomson of Glasgow University, who has been experimenting on the box sent to him from Paris containing electric energy, has arrived at the important conclusion that electro-dynamical energy may be stored and used for great purposes.

During the past few nights the electric lights on Broadway, between Fourteenth and Thirtieth streets, have been very unsteady and at intervals the lights have gone out. As gas is not in use between these points the street has at times been totally dark at night.

A telegram dated London, June 7, says that the Central & South American Telegraph Company of New York, has secured exclusive contracts for telegraph purposes from the governments of Peru and the United States of Colombia, embracing the Isthmus of Panama and the west coast of South America.

A dispatch from Berlin, on the 8th inst., says that a dynamite mine has been discovered under the metals close to the Gatchina Railway station, connected with a battery in the railway telegraph office. All the telegraph officials have been arrested. The Czar has been residing at the Gatchina Palace since the assassination.

Just how Mr. Longstreet can afford to sell a complete set of telegraph instruments—Western Union curved lever key, American Union pattern relay and Giant sounder—all for \$12, is more than we can understand. He does it, however, and the instruments give the best of satisfaction. See his half-page advertisement in another part of this paper.

In his address at the annual meeting of the Petroleum Exchange, on the 3d inst., in this city, President George H. Lincoln said that the telegraph consolidation had impaired the telegraphic facilities of the oil trade, and suggested that the oil interest should build a telegraph line for the use of the trade between New York and the oil regions.

A suit has been commenced in the United States Circuit Court at New York by the Weston Electric Light Company for infringement of one of the Weston patents on electric lamps. The patent was recently issued to Mr. Weston after a long contest in the Patent-office with Mr. Brush, and is said to cover very important features of the Brush system.

When the cable rates are again reduced to twenty-five cents or less per word, there should be a clause inserted in the rules that all Dutch words must be paid for at the rate of two dollars and a half each, nine-tenths of the amount to be divided equally between the operators. Every man should be enabled to respire regularly and freely, or if otherwise, to be recompensed therefor.

Professor Morangoni shows by a conclusive set of experiments that moist air is not a conductor of electricity. He proves that the loss of current in telegraph wires and the want of action in electrical machines during misty or wet weather are due to the condensation of moisture, carbonaceous deposits, adherent dust, spiders' webs, or the contact of branches of trees.

A curious story came by cable from Berlin on the 6th inst. It relates that a horse while crossing the electric railway, having set his hoof upon the rail, was instantly thrown down, so strong was the current; and another horse, having also touched the rail with his iron-shod hoof, received a shock which sent him galloping off in wild terror.

Sir William Armstrong, at Craigside, near Newcastle, England, has utilized a brook to run a dynamo-electric machine by means of a turbine water-wheel, and so manages to secure electricity enough to keep 37 Swan lamps in a state of incandescence in his house. In this case the motive power costs nothing, and electric lighting in this way is an exceptional luxury.

What a change a few short months sometimes work in the spirit of our dreams. A little while ago, every artist—and still more so, every would-be artist—held the key of the situation, as he thought, in his hand. He wouldn't take this position; he wouldn't work for that; his terms must be complied with—and now he is taking firm hold of himself by his coat collar, as it were, in the laudable attempt to drop into a solid spot.

On Sunday, June 5, during a thunder storm, the instruments at the D. & H. C. Co.'s office, White Mills, were completely demolished by lightning, although the pins were all in and the switch-board is furnished with lightning arresters. This simply proves that the wire from the switch-board to the ground was insufficient to carry off the electricity coming in on the wires, a fault often found in telegraph offices.

One of the most uncomfortable errors of the telegraph that has recently come under our notice was that explained in a message lately passing through the Chicago office. A lady, probably addressing an absent lover, says: "I am not married—mistake for worried." The mistaken words may be regarded as synonymous in more senses than one, yet no one will doubt that it made all the difference in the world to the young man.

The local gas company, accepting as a challenge the admiration evoked by the Swan electric lamps, at present lighting the thoroughfares of Newcastle, England, recently placed at the corner of one of the streets, in close contiguity to the electric light, one of Bray's three-light lamps. The lamp was obscured at the top, and the effect is described as very striking, its illuminating power being pronounced excellent. The advocates of gas-lighting obtained a victory for the old over the new mode and power of illumination.

There are certain difficulties in the way of safely lighting fiery mines even with the incandescent electric light, but these are by no means insuperable. The Swan system is about to be introduced into the Watson Colliery at Earnock, England, and the world will soon have the benefit of the experiment. The dynamo-electric machines will be set up in an engine-house at the colliery, and the electric cables will pass down from the nearest pit-shaft to the lamps in the workings. It will be some time yet before a crucial test is made. The engineer in charge says that the preliminary operations will take up two months.

From all that has been done during the last few years, it is quite evident that the art of transmitting power by electricity has advanced rapidly, and that its practical application is continually gaining ground. This, however, Mr. Alexander Siemens thinks, should not be regarded as a sign that the electric transmission will supersede every other system of transmitting power to a distance, but rather that there is a sphere for it, where it meets existing demands better than our present means, and it should, therefore, not be treated as an enemy of existing systems, but as a supplement to them, by the aid of which problems can be solved that could not otherwise be attempted.

Remarkable electrical phenomena are added to the earthquakes, floods, storms and comets that have already made this a year of marvels. About a week ago some of the people of Brooklyn were startled by an enormous fireball that is said to have exploded in the air over the city with a deafening report. On Sunday a similar fireball burst with a great noise close by the new statue of Gen. Kearney in Newark. Strange forms of lightning have been seen in England of late. Many scientific men trace a close connection between the excited condition of the sun and electrical displays on the earth. As the sun has not yet reached the culmination of its period of disturbance, yet more startling outbursts of nature's forces in our atmosphere are likely to be witnessed during the ensuing summer.

A meeting of 1,200 postal telegraph employés of London was held in that city on Saturday evening, June 11. Resolutions were passed calling a national conference of telegraph operators to be held in Liverpool in three weeks, and pledging the meeting to abide by the decision of that conference. Another resolution was unanimously passed, agreeing to strike if that

course of action should be decided upon. The meeting resolved to take immediate steps to bring about a total cessation of extra or overtime work, which appears to be a grievance, as also is the recent statement made in the House of Commons by the Right Hon. Henry Fawcett, Postmaster General, that overtime work is often voluntarily submitted to, and that when volunteers are not forthcoming, it is fairly allotted by ballot.

The electric street railway of Dr. Siemens, in Berlin, was opened for public travel on the 12th of May, with much success. A number of prominent officials and scientists were present. It is a narrow-gauge elevated street railway, mounted on posts placed on the street sidewalks something like portions of the elevated railway in New York, but on a smaller scale. The new railway is located on the outskirts of Berlin, and extends from the suburb known as Lichterfeld to Yeltow, a distance of about two miles. The passenger cars are narrow and short, carrying only 14 passengers. There are two tracks. The cars are propelled by a dynamo-electric machine, which receives electricity through the track and a suspended cable, from an electric generator, one at each end of the line, each generator driven by a sixty-horse engine. An average speed of twenty miles an hour was expected to be realized.

Mr. Alexander Siemens says that if the electric railway at Lichterfelde continues to work in a satisfactory manner it is to be extended, and there is no doubt that its success will greatly assist in the further introduction of electrical railways, either on the level of the streets or elevated, like the steam railways of New York. Over any other system, worked by steam or by compressed air, the electrical has the advantage that no heavy machinery has to be carried about to set the train in motion. The carriages can, therefore, be built in a lighter manner, thus reducing the power necessary to move them, and permitting all bridges and other superstructures to be built more cheaply than usual. Several carriages, each with a dynamo machine, can be joined to one train, and by this distribution of the motive power much steeper inclines can be overcome than when the same train is drawn by a single locomotive.

The new telegraphic management might look into this model telegraph office, an account of which we clip from the *Willimantic, Conn., Journal*: "Probably no lightning was ever so dumbfounded as the misguided and erratic streak that wandered into the telegraph office, at the west end of our shed depot, on Sunday afternoon. Whether it was thunderstruck, as it were, by the fearfully dilapidated condition of the alleged building, to which it had taken the trouble to gain surreptitious entrance, or was dismayed and demoralized by the overwhelming stench that pervades the place, or was afraid to proceed in its work of destruction against such fearful odds, is a matter for speculation, but certain it is that the fiery fluid was content with the cremation of the operator's trunk (a paper collar box) and contents and sneaked out, leaving its black mark of disgust on the switch-board."

The inventive genius of the United States will be fairly well represented at the Paris exhibition of electricity, though not perhaps as completely as it might be. Mr. Edison sends a large array of apparatus and devices. The visitor to the exhibition will be able to order a dinner cooked on an electric range; to study the workings of an electric machine which detects and measures odors; to see pure iron separated from black sand in an electric sieve, and bran separated from flour by another invention; to observe the workings of electric buoys and electric brakes, and to muse upon the progress of the age as he wanders among phonographs, telephones, electric motors and dynamo machines. The really practical and important feature of the exhibition will be the electric light. Of these there are now half a dozen which have been brought measurable near perfection, one or two needing only some slight modifications to realize the dreams of their inventors. A comparison of methods and results and a careful study of each other's apparatus cannot fail to be fruitful in valuable suggestions to the electricians of all countries.

## NEW YORK CITY ITEMS.

## Echoes from 195.

In anticipation of the rush of business from the summer watering resorts, ten new quadruplexes are about being added to the machinery of the office.

A recent applicant for a situation at 195 inclosed a tin-type photograph of himself, with the signal "73" scratched on top. This style of application shows a fraternal feeling which is highly commendable.

Wire Chief F. W. Cushing will start for Paris, France, about the 10th of July in the interest of the Gray Harmonic System. He will make a stay of three months abroad, and, as he speaks French fluently, no doubt his visit will be enjoyable.

The following notice of two of our young lady operators who passed their vacation South appears in the Nashville *Daily American* of May 31:

"Miss Willie M. Newland and her charming friend, Miss Minnie Hahr, of Hoboken, N. J., who have been visiting Nashville the past few weeks, returned to New York City Sunday evening, much to the regret of many admirers."

The talented young ex-vice-president was mentioned by his father-in-law, while giving evidence in the Williams suit, a few days ago, as "an active young man." If the story be true that on a certain occasion in the past he visited the General Manager, with fire in his eye and danger in his tread, it might have been added that he was also a brave young man. However, the General still lives.

## Other City Items.

Mr. Geo. B. Scott, Superintendent G. & S. Tel. Co., of this city, delivered a lecture before the Albany Electrical Association on Wednesday, June 8, on "Electrical Measurement."

"Our office," says an American Rapid correspondent, "puts one in mind of the famous English Company that was raised during the war, which consisted of ninety-nine officers and one man. The man was drilled to death!"

Mr. J. H. Bunnell has just returned from a visit to Mr. Henry Van Hovenbergh, at his interesting retreat in the Adirondacks. He says that the trout, the air and mountains there would keep him all summer, were it not for the pressure of his rapidly extending business here.

Mr. B. M. Plumb, formerly of the executive offices of the A. U. Tel. Co., this city, has resigned to accept the Presidency of the Fabric Ornamenting & Manufacturing Company, with headquarters at 56 Cedar street, New York. Mr. Plumb, who is a gentleman of uncommon energy and ability, has many friends among telegraphers, who will regret his retirement from the business.

A dispatch was received in this city stating that Mr. Jay Gould had been shot. The dispatch was suppressed until an investigation could be made, which resulted in disproving its correctness. The investigation, however, resulted in disclosing the fact that a syndicate exists, having branches throughout this country and Europe, with an agent constantly traveling between the two countries, which has for its object the promulgation of news designed to depress the market value of railroad stocks and other securities, grain, etc.

## PERSONAL.

A. G. Taylor is with the Oil Pipe Line at Osborn Hollow, N. Y.

Lady Allan, wife of Sir Hugh Allan, President of the Montreal Telegraph Company is dead. Sir Hugh is in Europe.

Any lady operator who would like to exchange a Northern or Western office for one in the South, address EARNEST, care THE OPERATOR.

Mr. C. W. Ross has resigned his position as W. U. Assistant Superintendent at Columbus, O. Mr. Ross is Vice-President of the telephone company in that city.

The public services of the Palatinate Literary Society, of Palatinate College, take place to-day, June 15. Mr. W. W. Weigley, of Myerstown, Pa., is chairman of the committee.

Mr. J. W. Haynes, of the Columbus W. U. office, has accepted a position with the L. & N.

Ry., at Evansville, Ind. Mr. Ed. S. Rose, of the Panhandle Ry., Columbus, fills the vacancy.

C. W. Potter, late chief repairer W. U. Co., Columbus, O., has taken charge of construction department for Southern Ohio Telephone Exchange Co., with headquarters at Portsmouth.

James Gamble has resigned the General Superintendency of the Pacific division of the Western Union Telegraph Company, the resignation taking effect June 10. He will remove to New York.

The President has appointed Norman Williams, of Chicago, Honorary Commissioner to the International Exhibition of Electricity and Electrical Congress, which convenes in Paris on the 1st of August.

Mr. Henry Bentley, the popular President of the Philadelphia Local Telegraph Company, who tips the scales at something like 250 pounds, rides a bicycle as nimbly and gracefully as any wheelman in that city. He rode over 300 miles in one stretch last summer.

The commencement exercises of the law school of the Columbian University at Washington, June 7, were a brilliant success. Mr. Will Haight, late operator W. U., and afterward on Dept. line, Washington, was President of the class of 1881, and Mr. John Arthur, late of the P. R. R. Company's Erie office, Second Vice-President.

Information wanted of Henry S. Judkins, operator, 25 years old, who has been gone from home for six years; last heard from at Lagrange, Ind., but went west from there. Any information concerning his whereabouts will be thankfully received, and what expense necessary gladly paid by his brother, L. F. Judkins, agent T. & I. R. R., Paris, Micasta County, Mich.

Mr. J. F. Howell, operator Atchison, Topeka & Santa Fe R. R., leaves La Junta, Colorado, July 1, to go to the Southern Pacific, and as a farewell from his present position sends us 41 new yearly subscribers to THE OPERATOR, with cash accompaniment, all from operators confined to his own division. As he journeys along the Southern Division he expects to considerably swell the list, and hopes that the telegraphers of that division will respond as unanimously to his requests for subscriptions as did their brethren of the Western Division.

When Mr. Jay Gould, in company with Sam Sloan and Sydney Dillon, was jaunting around in Pennsylvania last week, he remarked of a certain place near Scranton: "This place don't seem to have changed much since I ran the tannery here." So it seems that through all those years he can remember Charlie Pike of Wilkes-Barre, and still forget whether his check given last year was for ten or only five millions. An old admiral on his death-bed, once upon a time, could not confess his sins simply because he could not remember them, and so died in the peaceful thought that a bad memory is as good as a clear conscience.

Ex-Manager Bradford, of Providence, has been presented with a handsome gold watch and

chain. On the outside of the watch are engraved Mr. Bradford's initials, and a sounder and key, and on the inside the words: "Presented to Henry C. Bradford, by his many friends, on his retirement from the management of the Western Union Telegraph Office, Providence, June 1, 1881." The presentation took place at the Hotel Dorrance. After an excellent collation had been served the company indulged in pleasant speeches and recitations. Mr. Bradford was a prime favorite, both with his subordinates and the public.

The veteran, Mr. Geo. H. Wilkinson, is manager of the St. John's, Que., office, with Frank Richardson as chief operator and Arthur Freniere as assistant. At the Railroad office, L. E. Stevens is repeater for the St. Alban's wire and Mr. Harvey "Owl." At Farnham main office Wm. L. Hibbard is manager and P. E. Demers chief operator; and at the branch office F. X. Demers is manager and Miss Lizzie Williams operator. At Granby F. B. Farnsworth is agent and operator and at Waterloo city office, "Qo," Mr. W. J. Farbar is manager, P. Murphy operator and Chas. Dargneau assistant. At the "Wa" branch office, W. H. Frost is manager and Alex. Freniere operator, and at "Ro" branchoffice Mr. Rounds is operator and Miss Mills assistant.

## BORN.

VERCOE.—To J. H. Vercoe, W. U., Columbus, O., a daughter.

OWINGS.—To L. N. Owings, W. U., Columbus, O., a daughter.

COMSTOCK.—On Sunday, June 5, 1881, to J. S. Comstock, agent and operator, Walnut Grove, Minn., a daughter.

ROUSH.—May 26, to Mr. E. B. Roush, manager Western Union Telegraph Company, and agent of the Valley Railway, at Uniontown, Ohio, a daughter.

## MARRIED.

BACMEISTER—SMITH.—June 1, 1881, at Kansas City, Mo., by the Rev. E. C. Woods, Mr. Charles E. Bacmeister, of the W. U. Telegraph office, to Miss Ida M. Smith, both of Kansas City.

PEET—WILCOX.—March 9, 1881, at Portchester, N. Y., by Rev. J. Bastow, Mr. Frank A. Peet, of Canaan, Conn., to Miss Mattie A. Wilcox, manager Western Union Telegraph Office, same place.

FLEMING—CRAIG.—June 1, at the residence of the bride's parents, Wathena, Kan., by Rev. E. K. Miller, Mr. Charles A. Fleming, train dispatcher St. J. & W. R. R., St. Joseph, Mo., to Miss Minnie Craig.

## DIED.

HURLEY.—May 24, at Toronto, Ont., Timothy Edward Hurley, of the M. T. Co. force, aged 23 years and 11 months.

## THE DELANY RELAY AND SOUNDER.

RELAY.

The above cuts illustrate the Delany Patent Telegraph Relay and Sounder, now being manufactured and tested with a view to their general introduction on all Telegraph Lines liable to be affected by the Page Patent. These instruments are in all respects superior to any now in use.

Railroad companies and others desiring instruments for trial should apply to

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY.

BEST IN THE WORLD.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect Morse sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of the U. S. or Canada on receipt of the above price, by registered letter or money order.

## THE "MORSE" LEARNERS' INSTRUMENT.

THE BEST.

Price, \$4.50, complete with Battery, Book of Instruction, Wire, Chemicals, and all necessary materials for operating.

## THE LAW BATTERY. THE GREATEST TELEPHONE BATTERY.

### PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz. :

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

**PRICE, \$1.25 PER CELL.**

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

## The American Bell Telephone Company.

H. FORBES, President. W. R. DRIVER, Treasurer.  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## A \$20 BREECH-LOADING GUN FOR \$7.00.

NEW, PERFECT, FRESH FROM THE FACTORY AND GUARANTEED IN EVERY RESPECT. EVERY ONE THOROUGHLY TESTED AT FACTORY BEFORE EXPORTATION.

Owing to the failure of the LONDON & LIVERPOOL FIRE ARMS CO., of London, England, we have secured a consignment of their celebrated Breech-loading Shot Guns THE CHAMPION, at thirty-three and one-third cents on the dollar of the actual cost of manufacture. One hundred thousand stand of these Guns have been thrown on the European and American market, on a small portion of which have come to America. These we have secured entire control of and offer them for the purpose of introduction at less than cost of manufacture until JULY 15th, 1881, when the price will be advanced to the regular rate \$20.00 each. This Shot Gun fills the long-felt want for a reliable Breech-loading Shot Gun at a reasonable price. The country has been flooded with cheap, worthless American Fire-arms, made of inferior material miserably put together, and as far as reliability or accuracy are concerned perfectly useless. THE CHAMPION is new and perfect, finely finished, case-hardened and blued, made of every best material, and by the improved Attachments, as shown in cuts Nos. 1 & 2, are rendered superior to any other English or American Shot Gun. They are too well-known to need extensive description, when we state that they are perfect, and warranted GENUINE CHAMPIONS, as they are the biggest bargain ever offered in America, and will never be offered again. We GUARANTEE these Shot Guns to be in every respect as represented or Money will be refunded. You cannot tell us opportunity slip if you want a Shot Gun, and as a chance for speculation it is well worth your attention. You can at any time sell the Shot Gun for a great deal more than you gave for it. THE CHAMPION is a great favorite with Sportsmen on account of the rapidity and ease with which it can be loaded, and its superior shooting qualities. That it stands unrivaled, as a first class Fire-arm, is shown by the thousands of English testimonials on file. The editor of THE ATLAS (N. Y.) says: "They are the most extraordinary bargains I ever saw. They shoot equal to my \$90 Scott Gun." He has bought two. R. E. Reed, Secretary of the New York Ducking Club, says: "Your CHAMPION IMPORTED BREECH-LOADING SHOT GUN is an unheard-of bargain and worth at least \$20.00. Our Club will have several. I heartily endorse your assertions; this Shot Gun will more than satisfy every purchaser." ORDER AT ONCE as our consignment is only ONE THOUSAND and our limit is JULY 15th, 1881. TAKE NOTICE—We will send (until July 15th, 1881,) ONE CHAMPION IMPORTED BREECH-LOADING SHOT GUN as described above, carefully boxed, for \$7.00, and when Cash accompanies the Order will give Free one of our new Sportman's Cartridge Belts, as shown in cut, also 50 Metallic Reloadable Shells (last a life-time). Send Money by REGISTERED LETTER or POST-OFFICE ORDER at our Risk. Or we will send the Gun C.O.D. with privilege of Examination upon receipt of \$2.00 to cover express charges, or your express agent's guaranty that the Gun will be returned free of all expense to us if not taken by you, but we do not send the Sportman's Belt or Reloadable Shells if sent C.O.D., as this extra inducement is to those who send CASH WITH ORDER. Should you have no acquaintance with our Firm, and desire a reference as to our reliability, we would refer you to any Mercantile Agency, Express Company, Bank or Newspaper Publisher in this City. ORDER NOW, even if you have no use for a Gun for six months; you never will get another such Bargain. Address E. G. RIDEOUT & CO., 10 Barclay Street, New York. SPECIAL OFFER.—If you will get a Club of Five and send us \$35.00 we will send YOU one Gun free for your trouble.

SIMPLICITY AND EFFICIENCY

In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

40 West 18th St., New York.

Or L. G. TILLOTSON & Co., 5 and 7 Dey Street, New York.

**GUITAR NEW SYSTEM**  
PRICE ONE DOLLAR - WARRANTED.  
Diagrams used are easy, thorough and rapid. Guitars and Strings a Specialty. The Best and Cheapest. Send for Price List. PROF. A. J. WAY,  
20 EUCLID AVENUE BLOCK, Cleveland, Ohio.

## THE DEAF HEAR

BY THE USE OF **Peck's Patented Artificial Ear Drums.**

Not observed in use, and comfortable to the ear. Cushioned, ventilated and harmless, and perform the office of the natural drums. The only perfected and patented Ear Drums. Also patented in Europe and Canada. Send for Treatise on the Ear; mailed free.

DR. J. P. P. PECK, Proprietor,  
No. 115 Nassau Street, New York.

## WANTED.

The address of every Operator and Book-keeper in the United States and Canada. Send postal card to

**E. W. FARNHAM,**

72 Monroe Street, Chicago, Room 6.

**THE WALLACE DIAMOND CARBONS, OF ELECTRIC LIGHTS**  
MAN'F'D. FOR THE ELECTRICAL SUPPLY CO., 109 LIBERTY STREET, NEW YORK.

Telegraph, Telephone, and Electric Light Supplies.

Insulated Wire in all Metals and for all Purposes, Resistance Wire, Patent India-rubber Coated Wire, for Office, Annunciator and Electric Light Work, Patent In-braided Telephone Cords and Flexible Cordage, better, more flexible and cheaper than any other. Carbons for battery purposes, etc., etc.

NEW MECHANICAL

## Telegraph Instrument.

PATENT APPLIED FOR.

Combined Key and Sounder—No Battery Required.

Works perfectly as a Key, with sound equal to the best Sounder. For Morse Alphabet [Practice in sending and reading by sound, and for Teaching the Morse Alphabet. Can be carried in the pocket or small satchel, and is always ready for use. Price, with Instruction Pamphlet, package of Morse Alphabet Cards, etc., \$1.50. Sent anywhere in the United States by mail, prepaid, on receipt of price in stamps, or money order, or registered letter.

**J. H. BUNNELL & CO., 112 LIBERTY STREET, NEW YORK.**

## BOOKS.

Descriptive Catalogue—90 pages—of Books relating to Applied Science, including Books on Electricity, Electric Light, Electric Signals, Burglar Alarms and Call Bells, Telephones, etc., sent free on application.

E. & F. N. SPON, 446 Broome Street, N. Y.

**BROWNLEE & CO.,**

DEALERS IN

## CEDAR TELEGRAPH POLES.

Light Poles for Telephone Lines and Long Poles for City Use Constantly on Hand.

OFFICE: FOOT OF SHELBY ST., DETROIT, MICH.

**W. F. CLEWELL,**  
MINING BROKER,

Rooms 22, 23 AND 24,

No. 58 Broadway, New York,

Financial Agent for the

**NORTH HITE AND YOSEMITE**  
GOLD MINING CO. OF CALIFORNIA.

Prospectus mailed free on application.

## MUTUAL DISTRICT TELEGRAPH CO.

EXECUTIVE OFFICES,

29 MURRAY STREET, NEW YORK.

Offices are being fitted up in various portions of the city for the purpose of furnishing

**MESSANGER,**  
POLICE and FIRE SERVICE.

NO RENT WILL BE CHARGED FOR CALL BOXES.

The patronage of the public is respectfully solicited.

**H. W. POPE,**

Vice-President and General Manager.

## INSULATION IS USELESS

on Telegraph or Telephone lines if the branches of trees are allowed to remain in contact with them.

In keeping the trees trimmed, use

**WATERS**  
TREE PRUNER.

It is indorsed by Superintendents, Linemen, and everybody else who uses it. Send for our Illustrated Circular and Price List.

27 ARCADE, Rochester, N. Y.

## Telegraph and Telephone Department.

**POST & COMPANY,**  
CINCINNATI, OHIO.

LICENSED MANUFACTURERS OF

National Bell Telephone Co.'s

MAGNETO & ELECTRO CALL BELLS, ETC

Manufacturers of all kinds of Telephone Instruments, Bells, Plugs, Switch Boards, Annunciator Drops, Spring Jacks, Magneto-Engines for Switch Tables, and dealers in all kinds of Telephone Supplies and Tools; in stock and for sale at lowest prices.

Galvanized Line Wire, all numbers; Insulated Wire, all numbers; Insulators and Brackets, all sizes; Batteries, all kinds and sizes, at lowest prices.

FULL ASSORTMENT OF

Telegraph Instruments.

Agents and Managers of Exchanges are requested to correspond with us before purchasing.

We call special attention to our new improved Magneto Call Bells. Samples sent on application to agents and exchanges.

**POST & CO., Cincinnati, O.**

**DAVIS & WATTS,**

BALTIMORE, MD.,

Authorized Manufacturers

TO

**AMERICAN**

**BELL TELEPHONE CO.**

Magneto, Battery Bells, Etc.

We manufacture and deal in all kinds of Telephone and Telegraph supplies, and at the lowest possible prices.

Cwing to changing our Telephone system from Battery to Magneto, we have a large lot of our handsome nickel-plated bells, which we have put on new bases, removing all telephone connection, and will clear out at much less than cost of manufacture. They are wound to 30 ohms, with best silk-covered wire. Gongs are 3½ in. diameter and very loud, working parts incased in nickeled covers—which you like, either vibrator or single stroke.

Every part of our Standard Magneto Bell is guaranteed interchangeable, so agents can readily make their own repairs.

Line and Office Wire of all kinds and sizes; Brackets, Locust and Oak Pins, Insulators of every design; Gravity and other Batteries, of every description, at greatly reduced prices.

Correspond with us before going elsewhere. Samples sent on application to authorized persons.

Our "Prince of Learners" Students' Outfit, at \$4.30 complete, is still in the lead, and unexcelled in quality, and full money's worth.

Send for our catalogue.

**PURE ELECTRIC WIRE.**

MANUFACTURED BY THE

**Ansonia Brass and Copper Co.,**

For Magnets, Telegraphs, Telephones, etc., Insulated on the Bare Wire with H. Splittdorf's Patented Liquid Insulation, covered with cotton or silk.

All sizes of BARE AND COVERED WIRE in stock. The Conductivity of every bundle tested and warranted.

THE ANSONIA WROUGHTGONGS for Clocks, Indicators, Telephones, Call-Bells, Bell-Punches, Steam-hat and Railroad use—burnished or nickel-plated.

19 CLIFF ST., NEW YORK.

### THE SLAVES OF THE WIRE.

DEDICATED TO LORD F. CAVENDISH AND MR. FAWCETT.

Hark !

'Tis the telegraph clerk ;  
His eyes are red and his cheek is pale,  
For he toils each day from dawn till dark ;  
List, oh list to his pleading tale,  
And have of pity just one small spark  
For the telegraph clerk.

"I only ask for a man's just due,  
A fair day's work and an honest wage,  
And I claim the rights of my service, too,  
A pensioned rest in my gray old age.

"Do we ask too much for our days and nights?  
And is our demand for right a crime ?  
The poorest man in the road has rights,  
And he always is paid for his overtime.

"Am I servant or slave ? am I bond or free ?  
Weary I work the whole week through,  
There's seldom a Sabbath of rest for me,  
For the seventh to us is a work-day too.

"We are sick in body, in soul and brain,  
Though we plead for help there is no reply,  
And under the burden and mental strain  
Brothers and sisters sink and die.

"Justice and right is all we ask,  
A place defined in the service list,  
A fair reward for a fair day's task,  
And for this, in a body, we now insist."

Hark !

To the plea of the telegraph clerk,  
There's a fevered pulse in his heart and brain ;  
His hope is dim and his day is dark,  
How long shall we leave him to plead in vain ?  
How long shall the world on the wrongs remark  
Of the telegraph clerk ?

He gives unto words the swiftest wings,  
At the touch of his finger the dull wires speak,  
He holds in his hands the fate of kings,  
And he governs the world on a pound a week ;  
He rules the markets and guides the press,  
He toils by day and by night alike,  
Come, list to his story and give redress,  
Ere his cry shall change to the watchword "Strike !"

Strike !

Cries the telegraph clerk,  
And the wheels of the world are stopped at will,  
And trade is upset by a single word,  
The city life for a while stands still ;  
So ere the order to "Strike !" be heard,

Hark !

And right the wrongs of the telegraph clerk,  
—*London Society June 15.*

### Our National Portrait Gallery.

#### VI.

JOHN LENHART, OF NEW YORK.

Mr. John Lenhart, the subject of our sketch to-day, is probably one of the best-known operators in America.

Mr. Lenhart was born at Akron, Summit County, Ohio, and at the age of twelve years—when the telegraph, too, was in its infancy—he commenced work as a messenger boy in the

"O'Rielly" office at Akron. He soon became an expert operator. The proverbial adventurous spirit of a telegrapher seems to have been more fully developed in John than in most other men, and consequently he has probably done more traveling, by rail, boat, wagon and afoot than

honesty and manly character. Affable in manner, chivalrous as the traditional knight-errant, vigorous in intellect, blonde in complexion, weighing a solid 190 pounds and standing 5 feet 9¾ inches in height, it may readily be inferred that John's wide popularity is not wholly confined to

JOHN LENHART.

any other operator in the business. He has recently removed from Boston to New York, but his name is familiar in every telegraph office, and seems to be inseparably connected with all the stirring traditions of our craft. When the folk-lore of the telegraph comes to be written, the adventures of John Lenhart will not be the least interesting part of it. He has lived in New York, Boston, Chicago, Pittsburgh, Denver, Baltimore, Nashville, Mobile and scores of intermediate points, and is everywhere held in fond remembrance for his genuine, unstudied wit, rugged

his own sex. His literary efforts have been placed before the profession for many years, and are among the most amusing and popular of our peculiar literature. He writes with the easy grace of a cultured man of the world—killing off a rival with an epigram—always in the right; and, occasionally, with knightly courtesy, tossing off a neat verse or two to some Maid of the American Athens.

During the war Mr. Lenhart was chief operator of the Louisville & Nashville Railroad, and also clerk to the President, Hon. James Guthrie.

During the last ten years of his stay in New York he was with the Gold and Stock Telegraph Company, in the Stock Exchange. Here he became personally acquainted with every prominent Wall street man; has tried his luck on "the street," and has come out some thousands ahead; but, as he says himself, with a deep-drawn sigh, "it generally went as it came."

Although John has been one of the best manipulators which the telegraph ever produced, he is now growing a little "stiff" as a receiver, and the proverbial "gilt-edge" is wearing from his "copy." As a sender, however, he holds his own, while his genial good nature is perennial. Having been always regular in his habits, he has never been sick a day in his life; and now, sturdy as an oak, he is always to be relied upon, and always on hand when wanted.

#### The Magneto Telephone—What It is and How It is Made, with Practical Hints Regarding Its Habits.

If a current of electricity flowing in a circuit be allowed to flow steadily without interruption or reversal, it may be called "a steady current," and may be employed to maintain a uniform degree of magnetism in an electro magnet, to produce a light and for many purposes too numerous even for casual mention.

If a current flowing in a circuit be rapidly interrupted, as, for example, that of a primary circuit of a shocking machine, a Ruhmkorff induction coil or the circuit in which an ordinary vibrating bell may be working, the resulting current or currents will be intermittent, and if the vibrations are sufficiently rapid a musical tone will be produced. Such currents are known as intermittent currents.

If in a continuous circuit the strength of current flowing be suddenly increased or diminished, but without breaking the circuit, another system of electrical pulsation is produced. This also may be made to produce musical or other sounds; but still speech can not be transmitted. Such currents are called "pulsatory currents."

If, finally, in a continuously closed circuit, an electric current be flowing, and its strength be alternately *gradually* and yet very rapidly increased and diminished, so that the impulses of current may be graphically represented by a regular curve of wave-like form, we have still another system of current, which is now universally known as "the undulatory current." It is always represented as a line alternately undulating above and below a horizontal line.

It is the undulatory current which renders the transmission and reproduction of vocal sounds possible, because by its employment the pitch, the rhythm and the amplitude of tones can be reproduced at a distance.

The telephone is the instrument by which the undulatory current is utilized and made apparent, and the name simply means an apparatus by which sound is conveyed to or reproduced at a distance.

The currents generated in the telephone are produced on the well-established principle that when a coil of insulated wire is fixed upon or surrounds a soft iron core of a permanent magnet, or upon the end of a magnetic bar, any alteration in the distance of an armature placed in front of the core, alters its magnetism and produces a current in the coil. In the case of a magneto telephone, the armature is represented by the diaphragm.

Sound, it is well known, is the sensation produced in the ear when it is affected by undula-

tions of the atmosphere, and these undulations of the air, producing the sensation of sound, are themselves usually excited by the vibrations of the sounding body which set the air in motion producing waves which spread around in every direction.

When the diaphragm of a magneto telephone is vibrated, the number of its vibrations per second governs the pitch of the sound produced; the amplitude of the vibration determines the loudness of the sounds produced, and the direction of the electrical currents is determined by the direction in which the diaphragm happens to be moving and exercises an effect on the permanent magnet at the distant end of the line.

The telephone, then, at the transmitting end of the line acts the part of an instrument to transform sound into electricity, which it does in the following manner: The sounds uttered by the human voice strike against the diaphragm and cause it to vibrate; its vibrations in front of the permanent magnet causes magneto-electric currents to be induced in the coil which surrounds the pole of the magnet, and these currents, of course, traverse the line to which the coil is connected, and act upon the receiving telephone at the distant point.

The receiving telephone, in its turn, acts the part of an instrument to re-transform the electricity into sound once more, and thus reproduce the tones against the diaphragm of the sending station; for as the currents set up by the sending telephone, after passing along the line wire, enter the coil of the receiver, the magnetism of the magnet core is, by the action of those currents in the coil surrounding it, so modified as to cause it to set up vibrations in the diaphragm which exactly correspond in form to the vibrations of the transmitting diaphragm, and thus the original sounds are reproduced, with the exception that, the amplitude of vibration being considerable less, the sound is much fainter.

The telephone, as at present constructed, is a small and conveniently-shaped instrument, and is almost universally used as receiver alone, as it has been found that when used as a sending instrument its tones were too feeble for an extended practical use. Hence it has been largely superseded in this direction by one form or another of the well-known battery telephones, which will probably be the subject of a subsequent article.

The telephone is a bar magnet of hard steel, inclosed in a case of hard rubber. It is provided with a vibrating diaphragm, which is clamped between the telephone case and the cap forming the mouth-piece; the latter also being made of hard rubber. On the diaphragm end of the magnet is placed a coil of wire which, by means of two screw posts on the end of the telephone, is connected in the line circuit.

Such, in general terms, are the essential features of the telephone. In order, however, to a complete understanding of its working, and that its peculiarities may be thoroughly comprehended, we will enter more into detail; for the telephone resembles the fairer part of the human race in this, that it must be understood to be appreciated.

The magnet is made of four distinct pieces of steel, each one separately magnetized, laid together in pairs, with similar poles together, thus forming a compound magnet and one less likely to lose its magnetism. At each end between the two pairs is placed a soft iron core, or pole piece; the shorter one is placed at the end intended for the handle, the longer at the

diaphragm end. The coil, which is of very fine silk-covered copper wire, is placed on the longer core, and ordinarily measures about 75 ohms. Its wires are continued down beside the magnet, and soldered to two binding screws at the end. The diaphragm is simply a thin round iron plate, such as is used by photographers to prepare ferro-types on. The hard rubber case is made by the India Rubber Comb Company, of New York. In it the compound magnet and coil is placed, a screw is inserted in the lower end, to hold it, and the case is then filled up with a preparation of paraffine and turpentine, which serves to give solidity to the instrument and to keep the magnet from shaking about. Reaching a shade above the level of the coil core, the case bells out and forms a seat for the diaphragm, which must be as close as possible to the core, without actually touching it. It is clamped in place by the cap forming the mouth-piece, which is screwed on. The instrument is now complete.

The telephone has a few peculiarities which are, perhaps, not so well understood as they might be. Some of these will now receive attention.

To speak properly through a magneto telephone, the upper lip should just touch the mouth-piece and the tone of voice must be moderate. The resulting sounds will be much clearer in articulation and much louder than if the speaker were to get inside of the mouth-piece (which, speaking hyperbolically, many persons do) and then shout loud enough to wake his slumbering ancestors.

A case in point, which occurred at an exchange office where there had been no demand for transmitting telephones, the magneto telephones having given complete satisfaction, is treasured up in our memory. Arriving at the place in question, as we approached the Central office we heard frantic yells of "hello" uttered apparently with the full lung power of some blatant demoniac. This continued until we entered the office, when the cause of the uproar was discerned in the person of a boy of 13 who coolly informed us that he always halloed like that; and then if the subscribers didn't hear him through the telephone, they would through the air.

A mistake frequently made is to keep the telephone mouth-piece cap much too tightly screwed on. The general impression appears to be that the tighter the cap is screwed on, the better it will work and the louder will be the sounds reproduced. This is not confined to employes of the telephone companies. Almost every gentleman, lady, ploughboy or tramp who handles a telephone may be seen to carelessly unscrew the telephone cap and then screw it up again, apparently using all his or her strength in the latter operation. The fact is that when the cap is screwed on with more than a moderate degree of tightness, the movement of the diaphragm is fettered and the loudness and distinctness of the reproduced conversation correspondingly decreased. It is well, therefore, after screwing on the cap, if it be ever taken off, which is, however, generally unnecessary, to give it a slight turn back. The difference in the result is sometimes surprising.

Occasionally a telephone will decrease in power after being used for some time. This may be due to one of the following causes:

First, it is possible, from some reason or other, such as a poor quality of steel which may accidentally have crept in, or from lightning storms, or from powerful electrical currents received by

crosses from a foreign wire, that the magnetic strength of the telephone magnet may be greatly diminished, or even lost altogether.

To ascertain if such be the trouble, unscrew the cap, gently slide the diaphragm off, and try if the magnet be strong enough to support the diaphragm edgewise. That is, hold the telephone with one hand, coil downward, and present the edge of the diaphragm to the magnet core. If it will hold it, it should speak properly, and that is not the trouble. If it won't hold at all, don't try to tinker with it, but send it back to the supply department and have it replaced by a new one.

Secondly, if the telephone has been in a warm place, or if the weather has been unusually hot, the compound used to fill up between the case and the magnet may get soft and occasionally become so fluid as to run down and get between the core of the magnet and the diaphragm. When it again solidifies, the effect will be that the diaphragm will stick to the core and be thus impeded in its vibrations, or prevented altogether from vibrating.

The remedy in this case is obvious. Scrape the composition carefully from the core and from the diaphragm; rub both with a rag moistened with spirits of turpentine, and again screw on the cap, occasionally taking a look at it, to prevent a recurrence of the trouble.

Should it ever happen that telephones are used on a battery circuit, see that the zinc pole of the battery goes to that screw-post of the telephone which is marked Z. In other words, if the copper pole of the battery at the office is to line, the wire leading from the office must be connected to that screw-post which is *not* marked Z. If the zinc pole is to line, the wire from the office must be connected to the post which is marked Z. Then if the battery has any effect on the telephone, it will be to strengthen its magnetism, instead of to weaken it, as would be the case under the opposite conditions.

It is scarcely possible that with fair play the circuit wires in the telephone should ever be broken, yet they occasionally are. If no sound at all issue from the telephone, and a broken circuit wire be suspected as the cause, disconnect the telephone and place it in a battery circuit which is open. If the wire be anywhere broken, no sound will be heard on closing the circuit. If, on the contrary, the wires are perfect, a click will be heard at the moment of closing the circuit.

The beauty of the magneto telephone is its simplicity. Simple in construction and simple in operation, where is the marvel that it has become what it has—the household representative of electricity? It can be modified indefinitely and has been, there being over a hundred patents issued on such modifications. But so long as there is the magnet, the coil and the diaphragm, there is the telephone—the magneto telephone—and nothing more is essential to articulate speech.

#### The Consolidation.

JUDGE TRUAX SUSTAINS THE TELEGRAPH PEOPLE  
—WILLIAMS AND HATCH DEFEATED.

Judge Charles H. Truax, in the Special Term of the Supreme Court, on the 20th ult., handed down a decision dismissing the complaint in the suit of William S. Williams against the Western Union Telegraph Company and others, brought to restrain the proposed increase of \$15,000,000 of capital stock of the Western Union Company, with which readers of THE OPERATOR have already been made familiar.

Judge Truax finds that Jay Gould, Russell Sage and Thomas T. Eckert did not enter into an unlawful combination or agreement with others for the purpose of uniting large amounts of capital, and depressing the stocks of the several telegraph companies, in order that they might get control of them.

He holds that the property of the American Union was worth \$15,000,000, and that of the A. & P. \$8,400,000. He reviews the conflicting testimony on this point, and quotes the decision of Chief Justice Bigelow, which says that the valuation of such property must include, besides the value of its corporate property, the profits of its operation, the prospects of its future success, the nature and extent of its corporate rights and privileges, and the skill and ability with which it is managed. He finds that the scrip dividend of \$15,526,590 represents surplus earnings of the Western Union since July 1866. He holds that the Western Union was authorized to issue stock for these surplus earnings. After quoting the statute upon which the plaintiff relied to show that this issue of scrip dividend was illegal, Judge Truax says:

If the defendant, the Western Union Telegraph Company, has divided any portion of its capital stock among its stockholders, it comes within this statute, and the plaintiff is entitled to maintain the injunction already issued. What is the meaning of the words "capital stock," in the statute cited? The capital stock is not only the money put into the corporate fund; it is also the property put into that fund. It is to be distinguished from the certificates issued by the corporation, usually called stock certificates, which are simply the written evidence of the holder's right to participate in the surplus profits.

After concluding that the scrip is not the stock, Judge Truax says:

I am of the opinion that the statute means that no corporation shall divide among its shareholders any portion of "the property and franchises of the company," and that the action of the defendant—The Western Union Telegraph Company—in issuing the said \$15,526,590 of certificates of stock, of which action the plaintiff complains, is not prohibited by the statute above quoted.

Judge Truax holds that the increase of the capital stock of the Western Union to \$80,000,000 was authorized, and that the company had a right to waive payment in money and accept payment in money's worth.

The decision, which is very long, finally says that the defendants are entitled to judgment, dismissing the complaint on its merits, with costs.

On the following day, June 21, Judge Truax rendered a decision in the case of Rufus Hatch against the Western Union, the action being similar to that brought against the same company by Mr. Williams.

Judge Truax finds that Mr. Hatch bought 100 shares of Western Union stock the day before the agreement of consolidation, with knowledge that negotiations for consolidation were pending, and 400 shares four days after the agreement had been made, with full knowledge of the fact. He finds that the \$15,526,590 of stock issued to the shareholders of the Western Union Company "is not what is called watered stock;" that the agreement of Jan. 19 was made in order to perfect and extend the connections of telegraph companies in this State; that the laws of the States of Ohio and Pennsylvania have no authority over the Western Union Company, and will not prevent the execution of the agreement, and that the law of Congress set up by the plaintiff cannot restrain the Western Union Company from carrying out its plans of consolidation. Judge Truax finds as matter of law that Mr. Hatch had not such standing in a court of equity as would entitle him to bring an action to restrain the Western Union Company from performing the agreement of consolidation which it has entered into.

This will, by no means, though, be the end of this costly litigation, there being too many hungry lawyers tolerated to allow any case to rest where millionaires and rich corporations can be roped in. The list of lawyers in these cases was suggestively long.

Mr. Williams' counsel have already signified

their intention to take an appeal to the Superior Court, General Term, and if that fails, to the Court of Appeals. It is already claimed that Judge Truax has given an interpretation of the law in direct opposition in essential respects to that previously given by Chief Justice Sedgwick in granting an injunction pending the litigation. It is also opposed to that given by Judge Speir in the suit brought by Mr. Rufus Hatch.

This view of the matter is unfair, even if not totally wrong.

The *opinions*—there were no "decisions"—rendered by Chief Justice Sedgwick and Judge Speir were for provisional and temporary purposes, only both of them merely hearing the affidavits on both sides, and there was no cross-examination. These judicial opinions were consequently rendered upon partial testimony, and were merely intended to hold the company in check until the matter came up for a fuller hearing. We now have the *decision*, which is final until reviewed next October by General Term on appeal. Whether or not the case will ever get there is also doubtful. One side claims that Judge Truax's decision can only be reviewed by Judges Sedgwick, Van Vorst, Speir and Freedman, of his own court. Of these, Judges Sedgwick and Speir are prohibited by the code from hearing any appeal, because they previously heard a portion of the Western Union cases, so that Judges Van Vorst and Freedman only could sit to hear any appeal. Inasmuch as three judges must constitute a court to hear cases at a General Term, the cases of Williams and Hatch, if appealed, could not be heard until Judge Sanford, the only remaining judge, recovers his health, or until a new judge is appointed in his stead to make up a full General Term.

The other side claims that Judges Sedgwick and Speir are not disqualified; that, although Judge Sedgwick has already rendered an opinion on the Williams case, and Judge Speir one on the Hatch case, there is nothing to prevent Judge Sedgwick from hearing an appeal on the Hatch case, while Judge Speir may hear the appeal in the Williams case. So the Little Buttercup business can be prolonged indefinitely. Meanwhile, the consolidation can go on untrammelled.

On Saturday last counsel in both the Williams and Hatch cases filed notices of appeal from Judge Truax's decision.

#### The Telegraph in the Arctic Regions.

Before the California Academy of Sciences, on the 6th ult., Mr. James Gamble, General Superintendent of the Western Union Telegraph Company, presented a valuable paper on "Arctic facilities for running telegraph wires over frozen surfaces," thus retaining constant communication with parties when detached from the vessel exploring northward by dog-teams. He recommended the use of No. 20 gauge steel wire, weighing about 20 pounds to the mile, to be coiled on reels and carried on sledges, paying out as the party advances. The ice furnishes perfect insulation, and telephones or telegraphic instruments could easily be attached and used, enabling the parties out to report constantly, or to call at any time for aid. With this connection, rendering intelligent relief more certain, parties could venture much further away from their base of supplies.

Referring to Mr. George Kennan, and the objections raised by him, Mr. Gamble says: Among those who have been good enough to notice my suggestion and manifest an interest in it, is Mr. George Kennan, of Washington, a gentleman familiar both with the telegraph and the Arctic regions, having been connected with the Collins Overland Telegraph Company. He assisted in the building of that line during the period of construction, and afterward made a journey through Siberia.

Mr. Kennan is a most intelligent gentleman, but I cannot help thinking that his observations on this subject are mainly the result of his imagination, and not of practical experience in regard to the utility or inutility of a telegraph line in Arctic explorations.

At 20 lbs. to the mile, 100 miles of wire would only weigh 2,000 lbs. It could be wound on reels in any size easy to handle. The cost of steel wire of that gauge is about 20 cents a pound, so that the total expense, including cost

of reels, winding, etc., would not exceed \$1,000. Even in the event of a prejudice existing against steel wire copper wire could be used. In suggesting steel, I did so simply because of its greater strength and cheapness. But did such a danger exist as supposed by Mr. Kennan, of the snapping off of the wire at the turn of the reel under a low temperature, how was it then that the wire for those portions of the telegraph line built across Northern Siberia toward Behring Strait, to connect there by means of a cable with the Collins overland line on this side, was uncoiled? Several portions of that Siberian line were built and the wire strung during the winter, with the thermometer ranging down to 50° below zero, Fahr. The line running along the head waters of the Anadyr River and along the Okhotsk Sea was also built, the wire uncoiled and strung during the winter months. It was the only time of the year, in fact, it could most successfully be done, it being difficult to haul the loads of wire over that part of the country, owing to the wet and swampiness of the land during the other periods of the year.

Mr. Gamble claimed later knowledge of these affairs than that possessed by Mr. Kennan, and he urged Lieutenant Berry, of the Jeannette Relief Expedition, to take a small quantity of wire and some instruments and telephones, and to make the trial, for at least a short distance. The paper was full of interesting suggestions, and gave much valuable telegraphic experience while constructing the overland telegraph lines across our continent, especially the Sierra Nevada Mountains, where such cold weather and heavy snow are met with every winter. He said that obstacles should prove stepping-stones to progress, and urged that some practical test should be made as early as practicable, that every possible facility might be afforded to our brave Arctic explorers in the future. These sentiments were freely applauded.

In his rejoinder Mr. Kennan twits Mr. Gamble with being unacquainted with the conditions of Arctic life; points to the well-known scarcity of trained dogs and reindeer in hyperborean regions, and argues generally against the utility of such a scheme, even if it were feasible.

#### A Canadian Opinion of the Western Union.

The consolidated Western Union Company does not seem disposed to breathe freely until it shall have absorbed all the remaining independent telegraph companies it can. To-day the Northwestern lines have been added to the general system, negotiations are also in progress for the absorption of a company in Manitoba, connecting with the Northwestern, called the Great Northwestern, as well as with the Montreal Telegraph Company of Canada. The Western Union, it will be remembered, already controls the other Canadian Company, the Dominion. Considerable opposition is therefore manifested by patriotic Canadians to the amalgamation of their only remaining company.

The *Toronto Globe* of June 11th, referring to the matter, says:

The public can only have one interest in this subject; that is to prevent the consummation of a monopoly of the telegraphs, and to take every means to break up the monopoly if it should be constituted in defiance of public opinion. The shareholders of the Canadian company have, most of them, the same interest as the public in securing cheap telegraphy, but they have also another interest. Their property is now a remarkably good one. Dividends of eight per cent. with bright prospects of an increase, are by no means to be sneezed at in these days. Let them beware lest in grasping after an increase they lose that which they have.

The Western Union, with which the amalgamation is proposed, is a very imposing monopoly. Apparently the riches and powers of this corporation know no bounds. But in reality the Western Union resembles nothing so much as a gas-bag inflated to the point of bursting. Four dollars out of every five upon which it pays dividends represent not invested capital, but "water."

The Western Union is one of the most favored

targets of the stock jobbers. Several times over new telegraph companies have been set going with the sole object that the Western Union might be badgered into purchasing them at an exorbitant price. Jay Gould has himself played this trick more than once. His last scheme, the American Union, has been bought up by the Western Union within the past few weeks, Mr. Gould becoming a very large shareholder in Western Union, and thus apparently furnishing a guarantee that there will be no further hostile acts on his part. But, then, nobody knows from one day to another whether Jay Gould has "unloaded" his Western Union stock or not. To-day he may be a "bull," and to-morrow the most ferocious of "bears." There is nothing whatever to prevent him or any other capitalist or capitalists from starting a new telegraph company, with small capital, which can take away nine-tenths of all the business of the Western Union that yields any profit. Such a company could be started on one fortieth part of the capital upon which the Western Union is compelled to yield a dividend. In short, the situation of the Western Union is such that the temptation to prey upon it is irresistible. The very fact that its capital is inflated to an unconscionable extent lays it at the mercy of "wreckers." Then, the profits to be reaped by a competing company are so huge as to make the business of starting companies purposely to be bought up by the Western Union one of the most remunerative jobs on record, at least, Jay Gould has found it so.

The only argument of any real weight that is advanced in favor of the amalgamation is that the monopoly of the Atlantic cables is so close that under present arrangements the Montreal company does not get fair treatment. This is by no means an overwhelming reason why the entire telegraph system of this country should be handed over to Wall-street stockjobbers. The cable monopoly will not endure for ever, and it is high time that at least one of the several Atlantic cables landed on our shores was controlled by Canadian capitalists. Atlantic telegraphy is a hugely profitable business. There is plenty of unemployed capital in the Dominion. Why not have a Canadian cable and cease having our telegraphic messages sent through our own territory into the United States and thence back again?

#### A New Theory of Induction.

WERNER.

Induction, and the theory of induced currents generally, is probably one of the least known mysteries of electrical science, while, at the same time, as I hope to show, it is the most prolific in evil results. It has certainly not been heretofore demonstrated that an operator, by working continually on one circuit, and with the same person, may absorb, by induction, the character and bearing of his *vis-à-vis*, the stronger character, of course, prevailing. It was only a few weeks ago that Messrs. de Fevre and Cone, two eminent operators—the former being famed for the evenness of his temper—agreed to fight a duel, all owing to the baneful influence of some vicious telegraphic hob goblin, and, while the mischief may have been made by an unseen electrical sprite, there can be no doubt but that the mild and girl-like de Fevre acquired his pugnacity entirely by induction from the man whom he had never seen, but with whom he worked—the roaring Cone. This case is clearly confirmatory of my theory, and it is to be hoped that our scientists will now concentrate the various resources of their minds on this interesting subject.

It has long since been remarked by observant students of the theory of induction that while our operators working from one American station to another underwent no appreciable change—owing, doubtless, to a similarity of their national characteristics—those who have worked for any considerable length of time with our "kin beyond the sea," have acquired, doubtless by induction, habits and language startlingly foreign to their inborn natures. Thus a well-known native Nova Scotian of Scotch descent, cold and Calvinistic in temperament, who has worked the Atlantic cable to Valentia, Ireland,

for the past three years—although he has never been in that historic country—now swears "Begorra," wears a frieze coat and a high straight-up-and-down felt hat without a rim, smokes a black clay pipe with an inch stem, and refuses to pay his rent. But still later—showing that as the use of the telegraph becomes more constant the influences of induction are becoming more marked, even at home—an astounding change has been noticed in the character of the seraphic Mr. Smiler, who is studying for the ministry, and who was certainly the mildest and least courageous man in the Chicago office. After working for a year and a half on the same wire with Hank Smashem, a notoriously stubborn and belligerent operator in Cheyenne, Mr. Smiler had absorbed, by induction, so much of Mr. Smashem's nature that, in spite of the inexorable stringency of the rules in Chicago, he actually strutted down the aisle with his hat tipped over his left eye, loudly whistling "She's a darling, she's a daisy," and when mildly remonstrated with, upset the Manager's bottle of red ink, and threw the Traffic Chief's overcoat out of the window. When this same Mr. Smiler arrived home he openly sang, "I'm leaving thee in sorrow, Annie," although his wife's name was Jane, and she was of an extremely jealous disposition.

In Holland, an operator who could speak no language but Dutch, pure and simple, has been known, after working the cable to England for fifteen minutes, to arise from the operating table in Zwinjdrecht and exclaim in vigorous (induced, of course) Anglo-Saxon, "Twig the bloomin' relay," and "I've 'arf a mind to resign, you know."

There can be no doubt but that all these phenomena arise from induced currents between diverse characters. While innumerable other cases of the sudden display of abnormal characteristics in telegraphers are constantly occurring, it has also been shown that a wire manned by common operators works much faster when Eitemiller simply stands near it. But my duty is at present to state facts and not to account for them, and to point out to our electro-physiologists a new subject for research and one that, even if not as tenable or useful to true science, will, at least, afford more cheerful reading to the rank and file of our profession than the unbroken and dreary array of logarithms, cube roots and algebraical signs which now spread themselves all over our electrical journals.

#### The English Operators' Grievances.

Since our last issue the operators in the employ of the government in England have taken some vigorous measures to bring their dispute to a crisis.

On the 12th of June, at a meeting of 1,200 operators in London, it was resolved to call a national conference of telegraphists to be held in Liverpool in three weeks, and pledging the meeting to abide by the decision of that conference. Another resolution was unanimously passed, agreeing to strike if that course of action should be decided upon. The meeting resolved to take immediate steps to bring about a total cessation of overtime work.

Three days afterward, June 15, the London operators resolved to cease making overtime on the 27th of June, as a preliminary step to obtain a reduction of their hours of service. The Leeds operators approved the action of the London committee, and resolved upon a given date to discontinue all overtime working.

This seemed to act as a stimulating prod on the "Controller of Telegraphs," who issued a circular to the operators pointing out that it is impossible to satisfactorily dispose of the fluctuating business of a telegraph office without having recourse to overtime, which is, therefore, compulsory; but that any reasonable application for exemption from overtime will be duly considered. The operators, as might be expected, respectfully declined to take such an overdose of official blarney, and quoted from the reply of Right Hon. William Monsell, who was Postmaster General in 1871, to a question in the House

of Commons, in which Mr. Monsell stated that overtime was not compulsory. Upon this official precedent the men rested their case, considering that it settled the question. To strengthen their position, in view of the resolution to cease working overtime on the 27th of June, the operators met again and resolved that if any of them were suspended on account of the agitation, the whole staff would at once go out on strike and remain out until their colleagues are reinstated.

This action seemed to have the true ring, and it brought forth a proposition from the Postmaster General which, however, caused only disappointment. The leaders of the agitation regarded Postmaster General Fawcett's new scheme as vague and indefinite, and they could see no real benefit in it. A meeting of the Executive Committee of the telegraphers was, however, called to consider it. This body adopted a resolution that a fresh petition be drawn up, setting forth the points wherein Postmaster General Fawcett's scheme will not relieve them; also wherein its application is exceptionally favorable, and that the various points contained in their former petition be again put forward for Mr. Fawcett's consideration. The meeting also rescinded the resolution to cease working overtime on the 27th of June, pending a further reply from the officials.

Since then advices by cable say that the feeling of dissatisfaction among the telegraphers has caused many to seek employment in the offices of foreign cable companies, the pay of the latter being double that of government pay. Many have signified their intention to resign.

#### Extending the Telegraph.

Articles of incorporation of the Postal Telegraph Company have been filed in the office of the Secretary of State, at Albany. The company are to have wires in all parts of the United States, and are permitted to form telegraphic communication with foreign countries. The capital will be \$3,000,000, with power to increase the same to \$21,000,000. The stockholders are Henry Cummins, Henry E. F. Fanshaw and Samuel C. Gallaher. The company came into existence June 21, 1881, and is to continue until 1981.

The certificate of incorporation of a telegraph company, formed for the purpose of constructing instruments and establishing lines for working House's improved system, was filed in the County Clerk's office, in Binghamton, N. Y., on the 14th ult. The officers are as follows: Cyrus Strong, President; Royal E. House, Vice-President; Cyrus Strong, Jr., Secretary; Tracy R. Morgan, Treasurer. Arrangements are being made, and it is expected will soon be perfected, for the immediate construction of a line from New York to Philadelphia. This system is entirely novel, and is the result of nearly 20 years' investigation and study by Prof. R. E. House, inventor of the printing telegraph. The principle features are automatic and extremely rapid transmission. It is claimed by the inventor, and fully believed by those who have seen the machine in operation, that the average cost of transmission by this system will be much reduced, at least one-half, thereby making cheap telegraphy possible. During the coming year it is intended that all the principal cities shall be connected.

Mr. William B. Gill, late Superintendent of the Western Union 6th District, and Mr. D. P. Emminger have entered into a contract to build a new telegraph line from Philadelphia to Pittsburgh, Pa.

Besides these, we have also the Mutual Union Company, with a capital of \$5,000,000, the International with a capital of \$10,000,000, and another to be called the Graphic Telegraph Company will presently make its appearance. Of this latter company Mr. Keene is the originator. Its capital stock will be \$5,000,000.

The cable steamship Faraday, Captain Maypee, has completed the shipment of the remaining portion of the new American cable, and has gone to sea to pay it out.

A dispatch dated London, June 28, says that

the Faraday picked up the buoyed end of the new cable off Land's End and spliced it, and then proceeded for Newfoundland, laying the cable.

#### Alleged Maltreatment of the "Great Mogul."

The *Railway Age* gives the following incident of Jay Gould's recent trip to the West, but does not vouch for its truth:

Mr. Gould went out on the rear platform of the train, and stood there enjoying the scenery. A sudden lurch of the car caused him to clutch instinctively at the hand rail. A lynx-eyed brakeman observed the suspicious movement. So he opened out on Mr. Gould:

"There now, you can just go inside the coach. We don't purpose to have any dead men on our hands. Cows are bad enough."

Mr. Gould regarded the brakeman attentively.

"You go inside the coach. We can't slow up all the way on your account."

"I am merely enjoying the—"

"No back talk now. Rules is rules. You toddle for the coach. D'y'e hear?"

The brakeman advanced threateningly on Mr. Gould, who stepped down on the first step, and clung to the safety rail. The brawny brakeman grabbed his coat collar, and lifted him back on to the platform.

"Do you (shake) propose to (shake) go inside or (shake, shake) not?"

"If I was but a conductor—" gasped Gould.

"But yer ain't a conductor, nor a brakeman, nor an engineer, nor a fireman, nor a porter, nor not even a peanut. Yer nothing but a passenger, and yer (shake) place (shake) is inside (shake, shake, shake) the coach."

He shook Mr. Gould's hat over his eyes, and then thrust him into the car, after which he seated himself on the brake top, and allowed his indignation to be lulled to sleep by the rumbling of the train.

#### The New Mexican Cable.

The International Ocean Telegraph Company, through the contract recently made by General U. S. Grant, as its representative, with the Mexican Government, receives the authority to lay a sub-marine cable from the United States by way of Cuba to any point on the Mexican coast, except those places covered by the contract of the Mexican Cable Company. The new company also is authorized to build land lines from the coast to the Pacific, and from any point on its lines to the city of Mexico. It agrees not to charge more than 25 cents a word between Cuba and the Mexican coast, and not more than 5 cents a word over its land lines within the republic, without regard to distance, for messages destined for foreign countries. Government messages are to be sent to and from the capital at a reduction of 25 per cent. from tariff rates. Construction material may be imported free from duty and taxes, and the capital stock of the company is to be free from tax for forty years. The Mexican Government has granted the company liberal concessions in regard to using government land and appropriating those belonging to private persons. Arrangements have been completed for laying the cable between Cuba and the Mexican coast without delay, and work on the land lines will be begun soon.

It was stated in London recently that the telephone was established in America in 1878, and in 1879 it was established in England. The exchange systems in America at the present day numbered 132,692, and in England there were only about 15,000. The output of telephones in America for the year ending February last was 71,819. The reason that the system had not progressed so rapidly in England as in America was on account of the difference which had arisen between the post-office and the telephone company.

#### TELEPHONE DEPARTMENT.

In the Russian language "hello" is rendered "Tzikanfikrajanjanski," hence the unpopularity of the telephone in Russia.

Mr. E. H. Cook proposes, in the *Philosophical Magazine*, the term "sonorescence" as suitable for the phenomena connected with the telephone and the conversion of intermittent radiations into sound.

The telephones erected in connection with several of the fire stations of this city have given such satisfaction that it has been determined to extend the system to many of the more distantly situated stations.

The telephone is being introduced by the New Zealand Government into places where the telegraph does not exist. Between Collingwood and Motucka, a distance of 50 miles, a line has been opened, and is said to work admirably.

M. Duchateau, manager of a French telephone company, has set out for Brussels to represent the French promoters of a telephone company with a capital of \$2,000,000, to be started there under Belgian, English, American and French auspices.

"Hello, Uncle Mose, hello!" cried Jim Webster, as he hurried down the street, trying to overtake the old man. "Be keerful, Jeames, be keerful how you ondress yo'self to me; I ain't no telephone," replied the highly indignant deacon.

Early in 1879 Mr. D. Connolly, a lawyer, and a Mr. McTighe, an electrician, both of Philadelphia, patented an invention which they claim will give each telephone direct connection with any other telephone of the same company without the delay and trouble of communication with an operator at a central office.

A fine little telephone exchange has just been organized at Franklin, Pa., by Mr. James P. Keene, Manager W. U. Telegraph office. Forty instruments are already in circuit, with prospects for seventy-five or more in the near future. Subscribers wonder how they ever got along without the telephone.

Our Baltimore correspondent says: "T. J. McTighe, of Pittsburgh, a graduate of Mt. St. Mary's College, Emmitsburg, has invented an improvement in connection with the telephone, which, if successful, will revolutionize the present telephone exchange system. The improvement is for calling and speaking directly to a person without asking the assistance of the central office. Mr. McTighe is in this city looking after his interests."

A telegram from Boston says that the United States Circuit Court, on June 27, Judge Lowell, rendered a decree for the complainants in the suit of the American Bell Telephone Company, et al vs. Albert Spencer et al. This was a bill in equity alleging infringement of two patents granted to Alexander Graham Bell. The defendants admitted that they had infringed some valid claims of the second patent, but the plaintiffs have given them no evidence of such infringement. They rely entirely upon the fourth claim of the first patent, which is much more comprehensive in its scope. This claim was that the defendants are using a method and apparatus for transmitting vocal sounds which resemble those of the plaintiff in producing electrical undulations, copied from the vibrations of a diaphragm, and sending them along a wire to a similar receiver at the other end.

The court decides that the specific method of producing the electrical undulations is different. It is made on the principle of the microphone, which has been very much improved since the date of the first Bell patent. The judge says: "If the Bell patents were for a mere arrangement or combination of old devices to produce a somewhat better result in a known art, then, no doubt, a person who substituted a new element not known at the date of the patent might escape the charge of infringement. But Bell discovered a new art, that of transmitting speech by electricity, and has a right to hold the broadest claim for it which can be permitted in any case—not to the abstract right of sending sounds by telegraph without any regard to means but to all means and processes which he has both invented and claimed."

PUBLISHED SEMI-MONTHLY  
At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher

NEW YORK, JULY 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE INVIOABILITY OF TELEGRAPH CABLES IN WAR-TIME.

The editor of *L'Electricité*, Mr. W. de Fonvielle, has written an interesting and important letter on this subject to the French Minister of Foreign Affairs. Mr. de Fonvielle calls attention to the great loss and inconvenience which may at any time be imposed upon important commercial centres by the indiscriminate sacrifice of telegraph cables by nations which may undertake to make war upon each other. He concludes by calling upon his government to endeavor to bring about some combined international action which shall "throw over even the bottom of the sea the protection of the principles which the immortal Grotius, the founder of modern international rights, essayed to make reigning law on its surface."

The proposition to exclude all ocean telegraphic systems from warlike operations was made at Geneva last year by Sir Travers Twiss, but it has unfortunately been allowed to languish. It is now to be hoped that the able manner in which the subject is again presented by Mr. de Fonvielle, in view of the deliberations of the forthcoming Congress of Electricians, will result in some definite understanding between civilized nations. If suitable action be taken at that notable gathering, the delegates may be enabled to present the case subsequently to their respective governments.

It is true that the extension of land lines is so widespread that there will, very shortly, be nothing to gain by severing ocean cables—and in this connection it may interest our French contemporary to reflect that between New York and Paris, via the American continent and Asia, there intervenes but 39 miles of water—but, at the same time, our main object should be to minimize the danger of suspension of telegraphic communication by any route, and any scheme looking to the continuance of telegraphic facilities at all times will receive the cordial support of the American Government. It is obviously wrong for two belligerent powers to interfere with the telegraphic facilities—the diplomatic, commercial and social business, and the storm signal service—of neutral powers, and it is just as plainly the duty of all nations to police this important avenue of inter-communication. During the Russo-Turkish war we were prevented for months from sending a message over the Indo-European line, and only this year the submarine cables have been cut by contending parties on the west coast of South America. We care nothing about the differences of Chili and Peru, but we must insist that our merchants shall not be summarily cut off from communica-

tion with their correspondents south, and that the present international code be changed so that neutral powers shall not suffer by the severance of communication with their commercial dependencies. The advent of two exclusively American cables between England and this continent, and several others projected from here to South America and China and Japan, will give us a substantial stake in ocean telegraphy which may well lead our government to foster an international scheme which shall protect those valuable properties against the vandalism of contending war parties.

If the delegates to the Congress at Paris will take action upon this important subject, and if the American representatives lay the matter before Secretary Blaine, America will not be found behind hand in protecting the interests of our submarine cables.

In the decision of Judge Truax, sustaining the consolidation of the telegraph companies—objectionable as we have found that consolidation to be—we can see nothing but sound law and common justice, without misinterpretation or strain. The duty of the Judge begins with the ascertainment of what the law is, and ends with its application and enforcement. It is for him to declare the law, and for us, as good citizens, to "follow and obey."

The centre of interest in both the cases just tried seems to have been in regard to a corporation's voluntary expansion of its volume of stock certificates to cover property acquired from surplus earnings, and the distribution of those certificates among its own stockholders. Now, one of the most sacred rights of a free man is to be enabled to do what he likes with his own property—to loan it, sell it, lease it, or give it away, as he sees fit—and any judicial decision or Granger legislation, restricting that right, will never stand before the Supreme Court. To say that a tradesman shall not shut up shop when he finds that he has done only a losing business—or that he shall not shut up anyhow if he feels like it—and that after closing up he shall not sell the peculiar fixtures which he no longer needs to the only person having need for such fixtures—his rival in the same line of business—is a doctrine worse than despotism, and foreign to the free institutions of America. Property is mainly valuable because it is a realizable asset.

The selfish policy of a monopoly in pooling, combining and squeezing right and left is decidedly objectionable to most people, but it is a part of the great struggle for life. Its natural, effective and sure cure is free competition, and if some of our litigious characters would put into the organization of new companies the money and energy which they now devote to the lawyers they would find more profitable returns.

The earning power of a telegraphic plant is very great; it is as essential as the post-office, and any bona fide company created with a view to the establishment and maintenance of an independent opposition, which shall be honestly and judiciously managed, having for its principal object healthy competition and the public interests, must ultimately succeed; and if any new company now forming neglects at the present time to provide against being swallowed up by the monopoly, they will richly deserve that fate.

SPEAKING at a meeting of the Oriental Telephone Company, in London, on the 3d ultimo, Mr. John Pender said, "The government has

been too slow with the telegraphs during the past ten years, during which period scarcely a new idea has occurred beyond those which have been brought from America." A government monopoly, which never feels the stimulating influence of a wide-awake competitor, must always have a chilling effect upon inventors. As an example of this sleepy way of doing business, we may quote the following paragraph from the latest English papers to hand:

"Upon the recommendation of the Postmaster-General, the Lords Commissioners of Her Majesty's treasury have sanctioned the payment of a gratuity of £20 to Mr. Barnett, a telegraphist at Aldershot, who has devised an ingenious arrangement whereby an ordinary single-needle instrument can be converted into an acoustic instrument at a small cost."

Where an American inventor might have patented his discovery, and offered it to the highest bidder between three or four jealous, competing companies, and thus have obtained a fair price for it, your inventive Britisher has to be content with a hundred dollars, as a "gratuity" from the Lords Commissioners of Her Majesty's Treasury.

THE settlement of the great telegraph suits ought to be particularly gratifying to Mr. Giovanni Purissimo Morisini. It must be embarrassing, to say the least, to be compelled every once in a while to get up and swear, as Giovanni did—in fact, to make a clean breast of it—to solemnly swear that your front name is Giovanni, not George; that you are Treasurer of the American Union; have held that office since the organization of the company; haven't got the books of the company; don't know where they are; never saw them; never made an entry in them; never kept any account at all; never received any money; never signed any checks; never had any duties as treasurer; never received any salary; know nothing about the organization; don't know who appointed you; and, while you are positive it was one of the directors, you have forgotten who were the directors of that concern. That kind of swearing must be in the nature what the boys calls "a roast," and, therefore, as we said before, the happy conclusion of the trial must be extremely gratifying to Mr. Giovanni Purissimo Morisini. Somebody heard old Uncle Rufus Hatch swearing, but whether it was about the result of the trial or the testimony of Giovanni nobody can tell.

THE telegraph profession loses one of its brightest ornaments by the resignation of Mr. Fred N. Bassett, formerly of the New Haven office of the Western Union Telegraph Company; later with the same company in New York, and for the past six years with the New York Associated Press. Mr. Bassett has resigned to accept a position as confidential clerk in the office of the Postmaster General, at Washington, in which city he has been employed by the Associated Press for the past two years. To the many friends of Mr. Bassett the news of his appointment to such an honorable and lucrative post will be welcome intelligence, but among the telegraphers who have worked with him, his pleasant manners and superb ability as an operator will be sorely missed. "The qualities which constitute a gentleman," says Mr. Aldrich, "are indescribable and cannot be defined." Mr. Bassett possesses those qualities, however, in a marked degree, and if his success in life shall be measured by his merits and manly attributes, no man may look for a more hopeful future.

IN reply to a correspondent of this city we would say, on the authority of a prominent Western Union official, that in a few Southern cities the amounts paid for extra service appeared from the pay-rolls to be very large, and the managers were instructed to employ additional operators and discontinue the extra. No reductions, he adds, have been made in operators' salaries anywhere, with the exception of a slight change in the case of a clerk in Charleston and the rearranging of salaries in one or two cases in Philadelphia.

The night men in this city now work half an hour longer than formerly and the ladies, who used to report for duty at 8.30 a. m., must in future be on hand at the same hour as the men—8 o'clock. This addition to their hours of labor has not, as might be expected, been received with much favor by the night men; while one would think that the ladies, who get very much smaller salaries, should not be compelled to work quite as many hours as the men. However friendly one may be disposed to be toward the "new broom," there can be no mistaking the fact that the ultimate best interests of the company will be best served by judicious liberality and consideration toward its employés. There is a wide-spread feeling of discontent East and West, which the company should not increase by encouraging the very questionable "economy" of lengthening the hours of labor, and decreasing, whenever an opportunity presents itself, the salaries paid those upon whom depend the earnings on its \$80,000,000 of capital.

Good operators are already extremely scarce, and every turn of the vise sends more of them to seek in outside business for that remuneration, promotion and consideration which has been denied them from telegraph companies.

THE Ohio man, whose picture we present to-day, represents a race of telegraphers now fast dying out, and of that old stock—the blue blood of the telegraph—there was none more intelligent, cheery and philosophical than John Lenhart. Your operator is still a great traveler, but in John's early day the man was a nonentity who had not sent forty words a minute, earned fabulous sums of money, been "cleaned out" in Wall street, twisted a brake for a while on the railroad, and footed from New York to Omaha. Things have been toned down considerably since then, and many great changes, for better or worse we cannot say, have taken place. But through all those years rugged John has, in his own hopeful way of looking at the world, manfully withstood old Father time's vigorous onslaught, and has come out of the fray without a scar.

THE theory of Professor John Trowbridge that northwest winds along our northern coasts are usually accompanied by a positive charge of the atmosphere, and east winds by a negative charge, and that the coming of these winds can be predicted by observations on the electricity of the air, and the suggestion made by the same gentleman that the universities along the Atlantic coast, from Boston to Baltimore, should co-operate with the U. S. Signal Service in establishing stations to observe the electrical state of the air, are worthy of the most profound consideration. Observations might thus be taken by persons of higher attainments than the enlisted men now employed at the ordinary meteorological stations, and the experiment on this coast would, at least, decide whether or not it would

be advisable to extend the observations to other points.

AFTER a long and earnest struggle, conducted with such eminent courtesy and propriety of manner that its heat has been barely perceptible, it seems at last as though our English professional brethren were on the point of success. In refusing to work overtime the operators quote the ruling of Postmaster General Monsell, in 1871, which declares that overtime is not compulsory. The operators have for months expostulated with dignity and firmness with the present Postmaster General, and now openly threaten to paralyze telegraphic communication by a strike. The liberal government can not afford to precipitate such a public calamity, and the indications are that it will divide with its overworked operators the £355,000 which it pocketed last year as profit on an income of less than £1,500,000.

BILLS of complaint were filed in the United States Circuit Court clerk's office on the 14th ult., in suits by the Western Union Telegraph Company against the American Rapid Telegraph Company and the Mutual Union Telegraph Company and others for alleged infringement of a patent held by the complainant company, being certain new and useful improvements in "Induction Coil Apparatus and in Circuit Breakers," of which Charles Grafton Page was the original and first inventor. The Western Union Company prays for injunctions perpetually restraining the American Rapid Telegraph Company and the Mutual Union Telegraph Company from using any machinery containing said improvements.

IN the pending trials of the assassins of the late Sultan at Constantinople, it is sworn that Abdul Aziz, among other crazy freaks, wished to make his barber Director-General of Telegraphs, but on learning that the holder of such an office ought to have some knowledge of the business, and recognizing the ridiculousness of having the wires strung on barber's poles, he changed his mind and made the barber governor of a province. In this country no barber is qualified for a telegraphic director unless he has worked at least two weeks for the late American Union Company.

A CLASS of twenty-five Chinese students is receiving instruction in telegraphy at Hartford, Conn., and many of the members are apt pupils. This fall the advanced students, to the number of twenty, probably, will be sent to China, where they will be employed in practical work on lines which the Chinese Government contemplates establishing, or in acting as instructors of classes of their countrymen in the telegraphic system. President Doren may learn a lesson from this, by sending American operators abroad to work the American cables.

ARRANGEMENTS were perfected at Dayton, O, June 27, for consolidating all the telephone exchanges of the State by the organization of a general company. George L. Phillips, of Boston, has conducted the negotiations. The new company will have a capital of \$1,000,000, and connection will be established at once between Cincinnati, Cleveland, Toledo, Columbus, Dayton and adjoining towns. The longest circuit will be about 200 miles. This step is regarded as the first leading to the connection at an early date, by telephone, of New York, Chicago and all the principal cities of the Union.

THE approaching completion of the American cable to Europe promises a first-class war of rates between the old and new lines. It seems likely that the tariff will at once drop to the non-paying basis of 12½ cents per word, and if it does some one will be terribly squeezed. But Mr. Jay Gould is in dead earnest, and, although he swore he was "a little lame," it may be confidently asserted that it's a cold day when Jay Gould gets left. Meanwhile, under the cheap rates, which are bound to come, we may look forward to a tremendous rush of cable business.

IT would be a wise thing for our exhibitors at the Paris Electrical Exhibition to have printed, in English, German and French, lucid descriptions of their wares, and to see that the circulars thus printed are placed where they will do the most good. Since the "American" cable company has gone to England to have its cables made, it seems to behoove our native manufacturers to bestir themselves.

IN the London House of Commons on Tuesday, June 28, the First Commissioner of Works and Buildings said that members were not satisfied with the result of the experiments of lighting the House of Commons by means of the electric light, which were made during the late recess, and that further trials have been postponed until the next recess.

TO-DAY the Northwestern Telegraph Company, whose lines extend through Wisconsin, Minnesota and Dakota, will be taken into and made a part of the general system of the Western Union under a ninety-nine year lease, and will form a part of the central division. This is expected to greatly facilitate the transmission of messages.

THE custom of leasing wires is growing rapidly among brokers and merchants. This is drawing many of our best operators from regular telegraph offices and placing them in the counting rooms of prominent business men, where their ambition may find wider scope and better remuneration.

OFFICE hours on the 4th inst., in the Western Union service will be from 8 to 10 o'clock A. M., and from 4 to 6 o'clock P. M., except at repeating stations and principal offices, which will be kept open as usual, but with such reduction of force on duty as circumstances will permit.

ONE month from to-day the Congress of Electricians will assemble at Paris. Our correspondent sails hence on the 9th inst., and THE OPERATOR will have full details of the proceedings, as well as graphic descriptions of the electrical exhibition.

COMMUNICATIONS relative to the convocation of an international Congress for the preservation of the neutrality and inviolability of telegraph cables in war time may be addressed to "L'Electricité, 16 Rue du Croissant, Paris, France."

IF the Western Union would send to the Paris Electrical Exhibition an engrossed list of all the operators who have had their pay cut down since the consolidation, they would have a fine exhibit.

THE idea of electricity as a motive power seems to be enjoying quite a boom.

WESTERN UNION stock is quoted at 135; last issue it was 133.

## Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

"Practical as far as possible;  
Theoretical as far as necessary."

Q. 136. What are leakage conductors, and how are they applied to pole lines?

A. Leakage is a term applied to the escape of electricity from the wires in very small quantities. It is caused by imperfect insulation, which allows portions of the current to separate from its proper conductor and to divide itself between all the other roads to the ground, in proportion to their respective resistances. These other roads are, first, the pole, and second, the other wires, which are often of different lengths. So long as the current escapes to the earth, no great harm is done, as the only effect is to weaken the signals; but when it leaks into another wire it confuses the signals on the second line. The plan for remedying the trouble, first suggested by the English telegraph engineer Highton, in 1852, and subsequently patented by Varley in the United States, is to attach a thick wire to the pole, coiling the earth end in a spiral under the foot of the pole and continuing the wire till it projects above the top of the pole, thus serving also as a lightning conductor. Branch wires of a smaller gauge are then fastened to each earth wire, and extended along the cross arms to each insulator pin, to which they are firmly attached. Any current then leaking from a wire will naturally take the quickest way to the earth down the poles, via the earth wires. This is most effective in preventing interference between wires, when the earth wire is attached to every pole. The earth wires, however, do more harm than good when they do not make a good earth connection. A buried plate soldered to the earth wire makes the best earth. A patent has recently been taken out for improved appliances, which have taken the shape of metallic sleeves or sockets, fitted in the holes of the cross arms in which the insulator pins are inserted, and for a continuous wire running from pole to pole and attached to the earth wire of each pole. The English insulators, being generally fixed on metallic pins, do not need these metallic sockets.

Considerable attention has of late been given to this point, owing to the rapid increase of telephone lines, which, with their extremely sensitive instruments, render electrical disturbances of any character very evident.

Q. 137. Describe the different supports in use for housetop lines, giving proportions of the same.

A. These supports, which are technically called fixtures, are variously constructed, according to the character of the roof and locality where they are erected.

They were, until within the last few years, of very simple construction and comparatively small; but since the introduction of the telephone exchange systems, they have necessarily increased in size, and it is a matter of some mechanical skill to maintain the best proportions for strength and capacity.

Two general classes comprise the whole—Wall and Roof fixtures. These, again, are made single or double, according to the number of wires they are required to support.

A roof fixture is one which is absolutely placed on the actual roof of a building.

A wall fixture is spiked to the side wall of a building or a party wall.

A double roof fixture for telephone work should be made high, so as to clear all foreign wires. The upright posts should be at least fifteen feet high and five inches square, the cross-bars fourteen feet long and four by five inches in thickness, and secured to the uprights by lag screws. The upper cross-bar may be placed one foot from the top of the uprights, and the others eighteen inches apart. If but three are required instead of four, place them two feet apart. The insulators should be at least nine inches from centre to centre.

Two wooden braces are attached, each being connected from one upright just below the

lowest cross arm to the other upright near the foot. They are secured as follows:

One of the braces which cross each other in the centre is secured to the inside of the uprights by three-quarter-inch bolts and nuts, and should be of three by five lumber. The other brace is fastened to one side of the fixture and is secured to each upright and to the other brace, where they cross each other at the centres, by three-quarter-inch lag screws. The front and back braces must be of one-inch round iron, should reach up the fixture to a point immediately below the first cross-bar, and should be fastened at the upper end by five-eighths inch bolts, so that one set of bolts shall pass through both wooden braces. At the lower ends, the front and back braces should be secured to the roof by three-quarter-inch lag screws. All screws entering the roof should be carefully soldered over to prevent leaks.

In many cases it is preferable, and sometimes even necessary, to use wall fixtures, as they remove all danger of causing leaks in roofs and are equally servicable where roofs are pitched as when they are flat. The details of this fixture are in general terms the same as those of the roof fixture just described. The upright posts have a total length of twenty feet, fifteen feet of which stand above the top of the wall, and the remaining five feet are used for fastening the structure to a piece of plank previously secured to the side of the wall. This plank should be five feet long, about ten inches wide, and two inches thick. It should be spiked to the wall with seven-inch spikes, and will then form a substantial base for the support of the structure carrying the wires. The upright posts and the cross-bars are the same size, and are arranged in the same manner as those of the roof fixture.

Where not more than a dozen wires run in one direction, they may be supported by single fixtures, with one, two or three cross-arms. The general directions given for double fixtures of the same class may be applied with equal propriety, and either the roof or wall fixture may be used as occasion may demand. The usual length of single roof fixtures is about twelve feet, and the size of stock five by five inches. Angle irons are attached by means of lag screws to the foot of the upright and to the roof. The fixture is firmly braced on three of its sides by rods of one and one-eighth iron, hammered out at the ends, and fastened to the upright and to the roof by lag screws. The first cross-arm is twelve inches from the top of the upright, and the second and third eighteen inches from centre to centre. The two middle insulators are usually twelve inches apart; each of the others nine inches, and the outside insulators three inches from each end of the cross-arms.

The same description applies equally to single wall fixtures, except, of course, the method of attachment, which is similar in every respect to that of the double wall fixture.

The usual insulator employed in housetop work is the glass insulator, either "Pony" or Western Union size. Hook insulators are undoubtedly preferable in everything except cost.

All fixtures, cross-arms and boards should be of white pine and thoroughly painted. Spruce should never be used. Housetop fixtures should invariably be guyed against sideways strain.

If the wires pass in a straight line with the fixture, there should be two guys placed, one on each side of the fixture, to hold it against the side pressure produced by the wind acting on the wires. In case a section on one side of a fixture is longer and heavier than the section on the other side, a guy should be fastened to the fixture to pull against the strain produced by the heaviest section. In case the line makes an angle at the fixture, the guys should be disposed so as to pull against the strain. For guy wire use No. 9 galvanized iron. In arranging all guys the general principle should be remembered that the fixture will simply hold up the line and the guys must be strong and taut enough to resist all lateral pressure.

Fixtures should not be more than from 150 or 200 feet apart. Sometimes when a single line is to be run, light iron attachments are made use of, such as tripods, which, as their name indicates, are three-footed fixtures of round iron carrying an insulator on the apex of the triangle caused by the union at the top of the three legs. Ridgepole fixtures and chimney irons are other forms of light attachments which are more or less useful for light work.

Q. 138. What is the use of insulators in telegraph or telephone lines?

A. The use of insulators on aerial lines is to prevent the loss of electricity at the points of support. They must, therefore, be constructed of some substance which is as nearly as possible a non-conductor. It is essential that the electricity should arrive at its destination as little diminished in volume as possible, in order that it may thoroughly and easily perform its office.

To this end the conductor must be insulated at every point of support, both from the earth and from any other conducting wire which may be on the same poles.

The fact that some bodies offer very great resistance and that other bodies offer very little resistance to the passage of electricity, has rendered the electric telegraph possible. As all substances conduct in a greater or less degree, there is always more or less leakage to earth, and the working value of a telegraph line is the difference between the resistance of the insulators and the resistance of the conductor. It is, therefore, obvious that the better the insulation the better will be the operation of the line. When a wire is carried through damp places, underground, or through water—the insulation has to be continuous and the wire must be covered with India rubber or gutta percha.

Q. 139. In choosing insulators, what points should be considered?

A. In the choice of an insulator, the following conditions should be taken into consideration:

The surface between the point where the line wire touches and the substance of the pin bracket or pole should be as long and also as narrow as can be attained.

The material of which the insulator is composed should be as perfect a non-conductor as possible.

The insulator should be of such a form that its exterior surface will be thoroughly washed by rain, yet that its interior surface shall not be reached by rain.

It should have a surface which repels moisture.

It should be strong enough to resist any strain likely to be brought to bear on it.

It should be economical in first cost.

There is, however, no insulator that combines all these virtues, and the best way is to choose that which comprises the majority of them.

Hard rubber is one of the best insulators, but soon loses its surface and becomes rough and spongy when exposed to the weather. Glass, regarded simply as a non-conductor, is one of the best, but is objectionable from the fact that its surface has a great affinity for moisture, and will be covered with a moist film in nearly every state of the weather. It is, however, both cheap and convenient; and these considerations, in this country, so override all others that it is almost universally used. T. D. L.

### Cincinnati Notes.

To the Editor of The Operator:

SIR: I clip the following from the Cincinnati Enquirer:

About fifty of the leading telegraph operators of Cincinnati, Dayton, Hamilton and other points in Ohio, met in this city yesterday to perfect a permanent organization and mature some plan to prevent the cutting of wages. The session was with closed doors, but the men were determined to unite together so strongly that the telegraph company would not dare to refuse them a respectful hearing and duly consider their demands. One point of which the "Knights of the Key" complained is that they are frequently compelled to work on Sunday without receiving any additional compensation. They also fear, unless measures for protection are adopted, that the company will cut wages, which, it is claimed, are now entirely inadequate. Telegraphers unions are being formed all over the country, and the organization here numbers about fifty men, embracing the best operators in the city. On the second Sunday in July a meeting of the telegraphers from every part of Ohio will convene in this city, at which a State Union will be formed. One of the operators declared yesterday: "We know our power, and intend to use it. Not, however, to intimidate or threaten the company, but in a gentlemanly, respectful manner. We don't intend to strike, and we hope to settle all our differences by arbitration."

The movement in this city has already assumed formidable proportions, but everything is conducted with the utmost secrecy.

As there are several misstatements in this article, while the truth is so woefully exaggerated, I would ask for space in your columns to state

the facts. The operators here receive extra compensation for all Sunday duty, notwithstanding the *Enquirer's* statement to the contrary. I have heard no complaint, except from a few malcontents, of receiving "entirely inadequate" salary. Our salaries compare favorably with those of other large offices, and we are fortunate in having competent and popular management.

As stated in *THE OPERATOR* of June 15, a union of telegraphers has been organized in this city, its object being the same as that of the society recently organized in New York. One of its purposes is to aid its members when sick, and thus stop the everlasting circulation of petitions, appeals, etc. It is NOT a secret organization, and already numbers among its members four-fifths of the best telegraphers in the city, railroad and commercial.

The outlook for the next meeting is very encouraging. It will show the membership of this district to number at least one hundred and fifty, with bright prospects for the future.

As far back as I can remember, when any manner of organization has been effected among telegraphers, there has always been a certain number of snivlers and agitators, who endeavor to misrepresent its purposes. It is evident the *Enquirer* reporter talked with some one of this class.

Mr. J. R. Calder, general agent of *THE OPERATOR*, made us a flying visit last week. He left for the South Monday morning. He has had phenomenal success among all classes of telegraphers in his work.

Mr. Frank Farley is our latest arrival. Quite a number of A. U. operators have been transferred during the past month, but business is very brisk and there is little danger of anybody being "let out." GREFFIER.

CINCINNATI, O., June 24, 1881.

#### Milwaukee Melange.

To the Editor of *The Operator*:

SIR: Matters here remain in the same semicomatose condition previously reported. Some changes are evidently to be made in the force by removals, and others are rendered necessary by resignations. In connection with these changes I might mention that a certain person in some slight authority here has drawn down upon himself the indignation of the force by what they consider an exhibition of petty spite toward a N. W. operator, who thought of bettering his position by accepting a situation in the Chicago W. U. office, though not without giving the Milwaukee people due notice. The operator was to have a leave of absence to visit relations, but at the last moment received the information that "unexpected complications" would prevent his going. It turns out that the person of slight authority intended that when the operator who dared to think of accepting a position outside of Milwaukee should return from his vacation in the usual condition of impecuniosity, he should be told that his services were no longer required. The "unexpected complications" arose when Manager Weller (to his credit be it said) refused to indorse the action of the person of slight authority. It is generally believed that the latter will soon be relegated to a position which will allow of less abuse of authority, as the above is not an altogether isolated case.

From the West comes news of considerable importance. At Minneapolis both the chiefs, Messrs. Rogers and Vanbergen, have resigned and taken their departure; Mr. Rogers to accept a position in a train dispatcher's office in that city, Mr. Vanbergen going to Bismarck, Dak., as manager, vice Mr. J. M. Carnahan, who has filled that position for the past six or eight years. The vacancies at Minneapolis are not as yet permanently filled. At St. Paul, Chief Hughes has resigned, accepting an important position in the office of the St. Paul & Omaha road. Mr. Davison fills his place, and is in turn relieved by Mr. Anderson, both highly-esteemed St. Paul boys. The policy of parting with such gentlemen as Messrs. Robertson, Rogers and Vanbergen, of Minneapolis, and Mr. Hughes and Manager Jilson (who, it is rumored, is also to resign), of St. Paul, is, to say the least, of doubtful expediency. Whatever else may be said, the new management is losing a number of efficient and popular employees.

Supt. R. H. Hankinson, of Minneapolis, passed through Milwaukee on the 21st, apparently in excellent health and spirits.

With this issue, "Octopus" bids a fond adieu to the columns of *THE OPERATOR*, leaving for parts unknown.

Au revoir!

OCTOPUS.

MILWAUKEE, June 22, 1881.

#### The Cable Rivalry.

To the Editor of *The Operator*:

SIR: Rumor says that cable rates will shortly be reduced by the Anglo Company to 12½ cents per word. This means a declaration of war against Jay Gould's American enterprise. How it will result cannot now be determined, but that the fight will be prolonged and bitter admits of no doubt.

The Western Union, by its contract must furnish the Anglo with all proper facilities for receiving and distributing its enormous business all over the country and at a stated rate of compensation.

It does not appear, upon the face of affairs, how the former company can avoid rendering the same efficient services to its English rival as heretofore. I say rival, because the Western Union and American Cable Co. are both controlled by Mr. Gould, and their interests will be identical; therefore when the Western Union attempts to run an opposition cable traffic, a clash between the two cable companies will certainly occur.

The subsequent developments promise to be of a very interesting character. The Anglo Company has for several months past been represented on this side of the water by eminent legal talent and the tactics of the Americans have been closely watched. On the other hand, Mr. W. J. Dealy, General Manager of the new company, is now in London perfecting the arrangements for that side, and Mr. Dealy is so energetic and thorough in everything he undertakes that the result of his work is a foregone conclusion. Many of the best English telegraphers have already been engaged, and the government is to a considerable extent a loser thereby.

But will the Anglo profit by this reduction in rates? The Gould Company, I believe, have announced a tariff of 25 cents per word, and if given the same facilities that its rival enjoys will probably have all it can do at that rate. Then if the Direct and French companies maintain the present 50 cent tariff, the American, with its two cables, can do a paying business, but it is very doubtful whether the Anglo, at 12½ cents per word, can reach the same result, even if its cables are worked to their fullest capacity for the entire twenty-four hours daily, to say nothing of the tolls on each message which must roll into Western Union coffers.

Altogether it will be an interesting battle, and the legal aspect of the case will not be the least in importance. Should the "Mephistopheles of Wall street," aided by his Napoleonic lieutenant, succeed in ousting our British cousins from Western Union soil, what then? Will the Anglo build new lines of its own, or is it even now promoting the formation of many seemingly insignificant lines of telegraph, and looking forward to their future consolidation. With that purpose consummated, will the wealthy and powerful English corporation "carry the war into Africa" and grapple with Jay Gould for a share of the land as well as the ocean traffic?

NEW YORK, June 27, 1881.

H. C.

#### Chicago Notes.

To the Editor of *The Operator*:

SIR: Since our last communication the weather here has been excessively hot and business heavier than ever. The rush has been so great that the manager found it impossible to get help sufficient to handle it properly. The night men are worn out and the day force are not in a much better condition. For a week or more the manager, assistant-manager and three or four chiefs had to take a turn at the key in order to help out. The day force were compelled to wait from one to two hours after their regular time before being relieved for lunch, and then told that they might eat at their tables and be allowed half an hour extra, or get back in a few minutes. Now, if the management would not be so hasty in laying men off for trivial of-

fences, and relieve their men with a little more regularity, they would not find themselves short-handed so frequently, and a better service would be rendered to the company.

The exodus still goes on, with no sign of abatement. Bill Hopkins, chief of the repairers, has resigned, and, it is rumored, goes with the Mutual Union as Superintendent of Construction. Robinson, of the A. U. here, takes his place.

Adam Biedler, Assistant-Chief, has gone to one of the bankers here on their private line. Ed. Quick has gone to St. Paul N. W. Tel. Co. V. C. Muse to Ogden; C. F. Patterson to Cleveland; Carpenter to Indianapolis.

The arrivals are: Messrs. Herr and Kennedy from Toledo, O.; W. H. Griswold from Little Rock, Ark.; Warth and Wells from Milwaukee; Kelcher and Delarand, from New York; Summers, from Toronto, Ont.; Welsh, from Pittsburgh; G. M. Reynolds, from Springfield, Ill.; Goodman, from Lafayette, Ind.; F. Miller, from Pittsburgh, and Miles, from Kansas City.

Geo. Willis is acting Asst. Chief, vice Biedler, resigned. Geo. Thompson, do., vice Mixer, resigned.

Quite a large sum has been collected in this office for the widow Hunt, at St. Louis, whose husband was killed a short time ago by the falling of a derrick while on his way to the office. This is a worthy object, and we commend it to the fraternity at large for general support.

The check boys here are now compelled to work one night each in the week until 8 P. M., without extra pay. The boys are on their feet for ten full hours each day, and take their turn Sunday as well. Surely this is a sufficient return for the compensation allowed, without imposing an extra two hours upon them each week.

Scene on a Cincinnati Quad.—Cin. to opr. "V." in Ch: "Is everything one word?" "I sent it one word?" "Yes, you send everything one word." "Well, so everything is one word. 73."

We have a society here which takes in the majority of the men in this office, and I might say in all large offices in the States. It is only a matter of time when we, like the company we work for, will be one grand consolidation. A strike, however, in any shape or form is not contemplated. The society is more of a benevolent and social character than protective.

#### Echoes from the Rocky Mountains.

To the Editor of *The Operator*:

SIR: In order to harmonize all interests, Mr. E. T. Greene, the efficient and popular manager of the W. U. office in this city, was on the 1st inst. retired, and Mr. B. R. Bates, manager of the American Union, appeared as his successor. Mr. Greene's retirement was deeply regretted, not only by the telegraph fraternity, but by the public in general. On Sunday, May 29, the employees of the office assembled in the operating room, and Mr. J. M. Hogan, on behalf of his associates, presented Mr. Greene with a magnificent gold-headed cane as a token of their regret at parting with him.

Mr. Greene responded in a witty yet pathetic manner in paying a very flattering compliment to his late subordinates.

Our new manager is a brother of D. H. Bates, Assistant General Manager, and a gentleman well known and esteemed hereabouts. He is a thorough telegrapher and will no doubt make an excellent manager.

Messrs. W. B. & W. H. Hibbard were among the callers this week. Mr. J. J. Dickey, the newly appointed Superintendent, was in town Monday and Tuesday of last week. Mr. Geo. A. Warren and wife left for New York on the fifteenth. W. L. Jones has returned from a four weeks vacation. Mrs. Laura Beach has charge of the W. U. office in the Windsor hotel and does a remarkably heavy business. Charlie Gough has accepted a position on D. & R. G. Railroad at South Pueblo.

John Q. Smith, formally employed in the general office of the D. & R. G. R. R., this city, has charge of that company's station at Cañon City. Miss M. A. Carpenter resigned on May 15th to accept a more lucrative and less laborious position in Leadville. Business is very heavy on all wires. Messrs. Herne, Smith, Webster, McDowell, Ryan and Henry are the latest additions to the force.

COLORADO.

DENVER, Col., June 18 1881.

### Old-Time Telegraphers' Association.

To the Editor of The Operator:

SIR: The project of a general gathering of old-timers in the telegraphic fraternity culminated, as telegraphers generally are aware, in a happy and completely successful meeting in Cincinnati on the 7th of September last. On this occasion, a permanent organization was established, styled "The Old-Time Telegraphers' Association," with the following officers: President, O. H. Booth, Mansfield, O.; Vice-President, Geo. W. Dugan, Jackson, Tenn.; Secretary, J. C. Mattoon, Cincinnati; and Treasurer, F. A. Armstrong, Cincinnati. The next meeting of this association will be held at Niagara Falls on the third Tuesday of September (Sept. 20) next. I have received the constitution and by-laws from the committee, from which I quote, as a guide to applicants for membership: "All persons of good standing, who were engaged in the telegraph business in any capacity previous to 1863 shall be eligible to membership of this association, and may be received upon the payment of an initiation fee of five dollars." "This association shall meet as often as once in each year, at such time and place as may be agreed upon at the preceding meeting," etc.

It is earnestly requested that the various telegraphic journals, as also telegraphers individually, will extend their aid in giving the notice of this meeting as widespread publicity as possible, to allow every one ample time to make preparations to attend. It is also urged that all applicants will notify the Secretary promptly, that their names may be registered and to enable the Committee of Arrangements to form as correct an estimate as possible of the number who will attend. This committee, otherwise, reports flattering progress. Remittances may be made to J. C. Mattoon, W. U. Tel., Cincinnati, O. Indications all point to a much more largely attended meeting. Further details will be published as rapidly as they develop.

J. C. MATTOON,  
Secretary "The Old-Time Teleg. Ass'n."  
CINCINNATI, O., June 25, 1881.

### The Telegraphers' Union of New York.

To the Editor of The Operator:

SIR: The District Council of the Telegraphers' Union of this city met on Sunday, June 19, for the purpose of completing their organization. They supplemented the plan of organization embodied in the constitution by appointing standing committees to take charge of the different branches of business. The first one on organization, to establish and inspect branches and audit their accounts, is composed of one member from each branch. One member from each branch also constitutes an employment bureau. A committee on resolutions is formed in the same manner, and a committee on statistics and information is composed of five members.

Encouraging reports were received from all parts of the country showing that the Union had spread with unprecedented rapidity to all the large cities and towns as far south as Galveston and as far west as Ogden. In New York the membership is beyond the expectation of the most sanguine.

Resolutions were passed recognizing the great duties devolving on branch officers in keeping the members in line, and instructing the committee on organization to bring the ladies of the profession into the union.

The first footstep of policy was contained in the following resolution, which was unanimously adopted:

"Resolved, That this union will heartily co-operate with the officials of all railway and telegraph companies in enforcing the rule which excludes every one but employes from telegraph offices."

H.

### The Chicago Brotherhood of Telegraphers.

To the Editor of The Operator:

SIR: The telegraphers of Chicago, to the number of about one hundred and twenty-five, held a meeting Sunday, June 12, for the purpose of forming themselves into an organization, the objects of which are two-fold. The first is to bring out the better element in the profession as a class, in the way of social improvement by the promotion of industry, economy and temperance.

The other, though not the less important, is to make themselves—in a measure at least—free from the anxiety which comes with illness and its increased expenses.

The name of the organization being decided upon—"The Brotherhood of Telegraphers"—the officers were duly elected, and a constitution and by-laws adopted.

After some little discussion, it was finally agreed that in case of illness, a member should be entitled to draw ten dollars a week from the Association, the members meanwhile, as far as possible, endeavoring to fill in his time. While it seems at first as if it would be too great a tax to attempt making up the entire time, it is thought that, divided up among so many, the benefit will more than compensate for the burden.

The meeting was a thoroughly representative one, a feeling of clanship seeming to show itself in the hearty greetings, and the entire absence of the petty jealousies which so often come to the surface, even in the early stages of such organizations. Greetings are in order from kindred organizations in sister cities.

B.

### Cleveland Chronicles.

To the Editor of The Operator:

Business has never before been so heavy with us as it is at the present time, and the force, though large, is quite inadequate to insure dispatch. Business suffers severely on all hands, and when a man is sick on the night force, which is almost a daily occurrence among so many, some tired man who has already wrought a hard day's work is compelled to fill in his time until we are led to inquire if it is any wonder that operators in our large offices bear evidence of having the fate of the nation on their shoulders.

We regret to chronicle the severe illness of Mr. C. W. Heaton, who is suffering from congestion of the lungs.

Prominent among the new arrivals here are Messrs. L. T. Burghoff, L. G. Somers and James R. Mayer. Mr. Patterson, late of the W. U. office, Chicago, is an acquisition to the American Union in this city. Messrs. J. M. Cronenberg and Lester H. Hull, formerly of Cleveland, but late of Toledo and Wellsville, Ohio, respectively, called on us the other day, looking happy. Mr. F. E. Now, late of this office, is "now" at the city office of the Tuscarawas Valley Railroad.

At the instigation of several victims we respectfully request that non-subscribers to THE OPERATOR desist from tampering with the wrappers of papers belonging to others.

I. DUNNO.

CLEVELAND, Ohio, June 23, 1881.

### Washington (D. C.) Notes.

To the Editor of The Operator:

SIR: Business is rather dull here, as usual during the summer months. The most of our work is "relayed" business. John Stevens, J. W. Burruss and Geo. W. Kern have taken summer vacations. The A. U. is still open. We were surprised to learn, on the 20th inst., that our friend and co-laborer, R. J. Wynne, had resigned. "Bob" was universally liked throughout the office, including the management. While we regret his departure from us, we congratulate him upon bettering himself. The American Rapid is flourishing, if we can judge by the many brilliant signs we see in front of its headquarters. The Mutual Union seems to promise well. R. T. J. Falconer has also left us, accepting a position with Middleton & Co., bankers, leased wire. A few of the boys contemplate a two weeks' vacation, but it is not at all general.

SUMM T. IMES.

### Baltimore Notes.

To the Editor of The Operator:

SIR: The Brush Electric Light Co. of Baltimore has been incorporated, and has held several meetings at the office of Mr. J. F. Morisson, General Manager. The Carrollton Hotel is now using the light with great success, and numerous other applications for the use of the light have been received from manufacturers, newspapers, hotels, etc., so that there is now little, if any, doubt that the success of the enterprise is assured.

W. O. Eastlake, for a number of years with the W. U., but more recently with the A. U.; has been elected a member of the Corn and Flour Exchange, and will engage in the grain trade. At the A. U. office some changes have taken place. Miss O'Donnell has gone to Deer Park, and Miss McCoy to Oakland, Md., for the season; W. Lenz has gone to Canton, vice Miss Clark, resigned to enter into the state of matrimony; W. A. Dunn, late manager of the Continental, has resigned and accepted a similar position with the American Rapid Co. Tom Farley has left the W. U., and will go with the Mutual Union upon its arrival here. A telegraphers' society is being agitated among our railroad operators.

EXCELSIOR.

BALTIMORE, Md., June 21, 1881.

### Telegraphers' Aid Society.

To the Editor of The Operator:

SIR: The following is a statement of the affairs of the Telegraphers' Aid Society for the quarter year ending June 7, 1881.

Cash on hand March 7, 1881.....	\$419.71
Received since above date.....	\$173.00
Paid benefits to members.....	\$72.00
Paid expenses.....	29.60

Total payments.....	101.60
---------------------	--------

Net receipts for quarter.....	71.40
-------------------------------	-------

Total cash on hand June 7, 1881.....	\$491.11
--------------------------------------	----------

Members elected during quarter.....	14
Total membership.....	127

Very respectfully,

J. W. MORELAND, Secretary.

NEW YORK, June 27, 1881.

### American Exhibitors at the Paris Exhibition.

The following list of the American exhibitors at the Paris Electrical Exhibition of 1881, to open August 1, is published:

Electro Graphic Manufacturing Company, of New York; White House Mills, Hoosac, N. Y.; Weston Electric Light Company, of Newark, N. J.; Clinton M. Ball, Troy, N. Y.; Standard Electric Light Company, of New York; G. Morgan Eldridge, of Philadelphia; Smithsonian Institution, of Washington; Louis G. Dreyfus, of New York; Joseph M. Hirsch, of Chicago; Elisha Gray, of Highland Park, Ill.; Electric Purifier Company, of New Haven, Conn.; W. G. A. Bonwill, of Philadelphia; United States Electric Light Company, of New York; Thomas A. Edison, of New York; August Parts, of Philadelphia; George Cumming, of New York; L. G. Tillotson & Co., of New York; Dodson & Egée, of Philadelphia; United States Signal Office, Washington; Robert Haase, of Indianapolis, Ind.; Charles W. Hubbard, of Boston; Alexander Graham Bell, of Washington; Electro Dynamic Company, of Philadelphia; W. J. Phillips, of Philadelphia; Western Electric Manufacturing Company, of Chicago; Volney W. Mason & Co., of Providence, R. I.; A. Emerson Dolbear, of Somerville, Mass.; Theodore Schnanssen, of Allegheny City, Pa.; United States Patent Office, Washington; Connolly Brothers & McTighe, Washington, D. C.; American Electric Company, New Britain, Conn.; J. F. Bailey, Paris; John Michels, New York; New York Electric Light Association, New York; August Partz, Philadelphia; Edward W. Serrell, Jr., New York.

Experiments on radiophony are still conducted by M. Mercadier. Lately he reflected light from a piece of silvered glass, behind which is a small reservoir of air, having a thin plate of mica, or caoutchouc, which receives the sounds to be transmitted through a tube. At the place to which the light is sent one of the author's small glass tubes, with a smoked piece of mica, is used to receive the light, which is there concentrated by a lens or concave mirror. With this arrangement speech was distinctly though faintly heard at a distance of about 20 miles, although the windows of the room in which the speaker was stationed had been closed. It was also found that the solar rays gave the best effects when they were hottest.

## DASHES HERE AND THERE.

The pay of the operators on the Cincinnati, Indianapolis, St. Louis & Chicago Railroad has recently been advanced 10 to 15 per cent.

Lightning recently struck the switch-board in the Western Union, Norwich, Conn., office, filling the place with flame and slightly shocking the operators.

A young electrician of Cincinnati claims to have improved the electric light by using iridium burners. He expects to furnish them at \$7 per burner.

A telegram dated Havana, June 26, says that the cable steamer Dacia has successfully finished repairing the second cable between Havana and Key West.

Mr. A. H. Doane, of Cincinnati, claims to have invented an electric motor which he can attach to a street car at an expense of \$50 and then run the car for 10 cents a day.

Advices from East India convey the intelligence that the Thakore of Morvee—whoever he is—has introduced the electric light into his palace.

Mr. E. W. Farnham, already well known to our readers, advertises in this issue that he is prepared to teach the popular system of taktigraphy by mail. See his advertisement.

The experiment of lighting the streets of Albany, N. Y., by electricity has so far been successful that the Superintendent of Lamps has been authorized to cut off the gas lamps on the electric light circuit.

A London paper says that shares of the Brush Light Company are quoted there at over 100 per cent. premium—that is to say, the £10 shares, on which only £4 are paid, are quoted £3 10s. to £9.

R. J. Powers, Jr., is the name of the late operator at Wathena, Kansas. He forgot to deliver a train order on the 17th ult., which caused a smash-up. There were two people killed and three injured, one of the latter being considered beyond recovery. Mr. Powers is now languishing in jail at Troy, Kansas.

Next Wednesday, July 6, Mr. Edison will ship his large dynamo machine to Paris. The engine has 200-horse power, and its speed is 355 revolutions per minute, thus equaling in power and speed a large locomotive running at the rate of a mile a minute. It will work 2,000 electric lights of sixteen candle-power each.

The Pond Indicator Co., of New York, last week placed their first instruments in Altoona, Pa., the P. R. R. having adopted them to protect their property in that city from fire. The indicator is an ingenious call system, which will undoubtedly, as soon as introduced, take the place of the devices now in use for that purpose.

Experiments regarding the velocity of light show that the electric light travels faster than sunlight. The velocity of the latter is found to be 186,500 miles a second, while the light from an electric lamp travels at the rate of 187,200 miles a second, due probably to the fact that there are more blue rays in that light.

The electric railway between the Lichterfeld station and the Central Cadet Institution, in Germany, proved such a success that it has been decided to extend it. The line is first to be continued to Teltow, and subsequently to Potsdam. At road crossings the conductors of the electric current are in future to be laid under the ground, so that horses may not be exposed to a shock.

Messrs. John Wiley & Sons have an interesting advertisement in this issue of Naudet's popular and important work on electric batteries, a copy of which every telegraph and telephone man should purchase and read. The advertisement also contains a list of useful scientific books published by Messrs. Wiley & Sons, of particular value to the electrical fraternity. Catalogues will be mailed free.

Mr. A. B. Smith advertises the Barron Flexible Key Knob in the present issue. These key knobs had a very extensive sale among telegraphers when advertised before, a short time ago, and the universal indorsements they received were of the most unmistakable character. There is no reason why they should not have an equally large sale now. Every one troubled with telegraphers' paralysis should give them a trial.

A message from South America announcing the discovery of the comet suffered terribly at the hands of the customary telegraphic error fiend. As received here, it read: "Buenos-aeres. June first. Eighteen hundred koen comet fi hours south thirty degrees Gould."

The probable drift of it is believed to be that Jay Gould, as one of the early birds, discovered the comet in right ascension "fi hours," and declination 30°.

The Blanchard Manufacturing Co. have added to their advertisement a brief description of the principal food cures manufactured by them, which will be found interesting reading. A few dollars expended in these foods will be of more benefit in making one well and keeping him well than a much larger amount devoted to drugs. Telegraph and telephone men need these food cures more than most other classes, and should at least give them a trial. Send for descriptive circulars, which the company will mail free on application.

The Magnetos of the Gilliland Electric Manufacturing Company, of Indianapolis, Ind., have played several games of base-ball since their first with the Telegraph nine, beating the Butler University nine in two games—scores, 26 to 5 and 11 to 6, and the East End nine—score, 20 to 7, and being defeated by a nine composed of seven deaf mutes from the deaf and dumb asylum and two professionals from town, by a score of 22 to 9. They have been compelled to stop playing for two or three weeks, a stress of business keeping them close at work. They expect, however, to play the Telegraph nine again soon.

The *Irish World* of this city indignantly announces that messages from Mr. Quinn, Secretary of the Land League, are no longer permitted to come over the cable, in proof of which it publishes the following:

"DUBLIN, June 16, 3 A. M., 1881.

"My message for this week's *Irish World* is refused at the office of the Direct United States Cable Company. The previous order to accept has been cancelled.

QUINN."

The editor says he will not be "balked in this way," and, if the Direct Cable Company will not send the message, he will see what can be done with the French Atlantic Cable.

The central division of the Western Union Telegraph Company, which heretofore has comprised all that territory west of the western extremity of New York, Pennsylvania and West Virginia, and from the lakes on the north to the Ohio River on the south, and west to Salt Lake, also all territory lying north of Arkansas and west of the Mississippi River to Salt Lake, in charge of Col. R. C. Clowry, General Superintendent, with headquarters at Chicago, has been extended by order of Gen. Eckert, so as to include California, Oregon, Nevada and Arizona, heretofore called the Pacific division, with F. Jaynes, Division Superintendent. Under the arrangement the central division will embrace the country west of Pennsylvania and north of the Ohio River.

## NEW YORK CITY ITEMS.

### Echoes from 195.

Mr. George Cumming is the inventor of a new key.

The Bunnell keys in use at 195 give general satisfaction.

Mr. P. J. Tierney succeeds Mr. Read on the Philadelphia circuits.

Heber C. Robinson, ex-manager of the Philadelphia W. U. office, was at 195 last week.

Miss Annie Ross, who had the misfortune to sprain her ankle, has returned to the office after two weeks' absence.

Mr. E. G. Read, a strictly first-class operator, has been transferred from the Philadelphia Quad to the cable department.

Mr. F. W. Baldwin transmits the race messages to the pool rooms over three circuits simultaneously on the ambidexter principle. He sends easily on the two keys with his right hand and on one with his left.

Supt. Geo. F. Milliken, of the Mutual Union, visited the operating room on Thursday last. He was warmly greeted by the facetious John Lenhart, who pronounced Mr. Milliken "the only decent man in the business."

Horse racing excites more attention at 195 this year than ever before. Even those who are opposed to betting on principle cannot resist the inclination to "pick the winners" for others who do not share their scruples.

Mr. James D. Reid returned from Europe last Tuesday, looking remarkably well. He was called suddenly to Paris on account of the illness of his daughter. The latter, Mr. Reid's friends will be glad to know, is getting better.

Some changes have been made at the switch-board. Mr. Leslie has been assigned to the western circuits, Mr. Catlin the eastern, and Mr. Gregory the southern division. Several "chairwarmers" have signified their intention to steer clear of the West in future.

In reply to a correspondent at 195, we would say that the telegram announcing the result of the Derby race, which was transmitted from the grand stand at Epsom to New York in five seconds, was repeated at London, Ireland and Tor Bay. It only consisted of one code word, and every preparation had been made to prevent delay, all business on each of the circuits being suspended for the occasion.

### Other City Items.

Mr. Frank W. Lord, formerly of the A. & P. office, is pleasantly situated as operator at the Fire Alarm headquarters in Mercer street.

Mr. Theo. S. Weaver, formerly with the Continental Telegraph Company, Spring and Broadway, has again been appointed Passenger Agent of the New York & Brighton Beach Railway.

The first annual picnic of the Telegraphers' Benevolent Union, of this city, took place at the Bellevue Gardens, Eightieth street and East River, June 20, and was a complete success. Many well-known telegraph and telephone men, with their families and friends, were present. Dancing was kept up until 3 A. M., and all heartily enjoyed the occasion. Much credit for the success of the picnic is due Mr. A. J. Gilman. The association, whose members are principally linemen employed by the W. U., Met. T. & T. and Gold & Stock telegraph companies, has only been in existence for about a year, and already numbers over one hundred members, among whom are many of our oldest telegraphers. The organizers expect that in the near future the association will spread over all the States in the Union.

## PERSONAL.

The democrats of Napoleon, Ohio, have recently elected as Treasurer of that township Mr. J. K. Withers, an old telegrapher.

The youngest and one of the most proficient telegraphic operators in Pennsylvania is Mary Denton, of Forestport, 10 years of age.

Miss Fanny Bullock, daughter of Ex-Gov. Rufus B. Bullock, was married at Worcester, Mass., on the 16th ult., to Dr. William H. Workman.

Mr. Patrick Sullivan, formerly of Bangor, Me., W. U. office, will have charge of the Wentworth House telegraph office, Newcastle, N. H., for the season.

Mr. W. A. Culp, formally of Nashville, Tenn., and more recently of Lexington, Ky., W. U. offices, has been reappointed Manager at Henderson, Ky., his first love.

Mrs. Mattie Lewis, formerly of the American Union Company, succeeds Miss Hattie Partridge as "manageress" of the ladies' department of the Boston office of the Western Union Company.

Mr. J. F. Henrici, Chief Operator A. V. R. R., Pittsburgh, Pa., has resigned to accept a position in the General Superintendent's office B. & O. R. R., same city. Mr. Jno. B. Stewart fills the vacancy.

An inquirer wishes to learn the whereabouts of R. G. W. Denison, a telegrapher, formerly of 145 Broadway. He went to Annapolis, Md., and for a time was manager there. He was last heard from at St. Louis.

Mr. E. E. Adams has resigned his position as manager of the W. U. office and accepted a situation in the dispatcher's office, C. & N. W. middle division, at Belle Plain, Iowa. Mr. Fred Rollins is his successor.

Edward McWilliams, a lineman of the Penn-

sylvania Railroad, fell from the liberty pole at the intersection of Grand and Washington streets, Jersey City, on the 27th ult., and died the following day.

L. M. More, formerly manager of the A. U., Buffalo, N. Y., Dock office, and more recently manager of the W. U. Dock office, has resigned. Mr. Thomas C. Eipper, an "old timer," has been promoted from the ranks to fill the vacancy.

At the meeting of the Great Northwestern Telegraph Company, held in Montreal, Hon. A. G. Bannatyne, the president, resigned, and was succeeded by Erastus Wiman, of New York. A. W. Ross retired as director, and was succeeded by Richard Fuller, of Hamilton.

At Danville, Ill., Mr. Chas. L. Kelley, former manager of the American Union, has relieved manager Helm, who has had the office for five years. The assistants are Jas. E. Blanchfill, chief; Jno. F. Shorter, of St. Louis, and Will Kennedy. The telephone is managed by Miss Eva Beck and is in a flourishing condition.

The A. U. Chattanooga office will be moved into the W. U. office to-day, July 1, with Mr. J. B. Norris, manager of the A. U., in charge. Chattanooga will hereafter repeat considerable of the Southern business that was formerly repeated at Montgomery. Two duplexes and one quadruplex will be added to the instruments in the office.

The position of assistant superintendent at Harrisburg having been abolished, Mr. H. A. Clute, who has held the position for fourteen years, leaves the employ of the Western Union Telegraph Company to-day, July 1, and will hereafter give his entire time to his telephone interest, for which he has the agency in six counties, including Harrisburg and Lancaster cities.

Mr. C. W. Hammond was, on June 10, appointed superintendent of telegraph of the Texas & Pacific, and of the International & Great Northern leased properties, with headquarters at Marshall, Texas. No operator will be permitted to work upon the line without Mr. Hammond's full consent. Mr. D. J. Healey will continue to act as assistant superintendent of the I. & G. N. telegraph lines.

The offices of the Great Northwestern Telegraph Co., beginning at Winnipeg, are: Superintendent's office, Thos. Prest, Supt.; Train dispatcher's office, Messrs. Egan and Foster, dispatchers; Syndicate general office, Mr. Rutherford, operator; Stonewall, F. Revell; Meadow Lea, M. C. Wright; Portage la Prairie railway office, Messrs. McNab and Foote; Portage la Prairie, head office of the western division, H. J. Woodside.

The A. U. office at Rutland, Vt., has been closed, and the wires transferred to the W. U. office. The latter has been enlarged. Eighteen wires now enter the office, and thirteen sets of instruments are in use. Mr. L. G. Bagley, who has been manager for the W. U. for many years, is retained as manager of the consolidated office. Mr. F. W. Gary is chief operator; Messrs. E. H. Bruya and J. A. M. Jones day operators, and Mr. J. F. Murray night operator.

The Western Union and American Union offices in Harrisburg, Pa., will be consolidated after July 1, and will be in charge of Mr. Charles A. Bigler, at present manager of the American Union office. Mr. Miller, of the latter office, and Mr. Ziegler, of the Western Union, will be retained under the consolidation. The loss of Messrs. Boggs and Smith, who will retire, will be much regretted by their many friends. The latter gentleman has been tendered and accepted the position of manager of the Lock Haven office, while the former has not yet accepted one of several lucrative positions offered him.

At Norwich, Conn., on the 14th ult., during a thunderstorm, a flash came into every office and dwelling in which was a telephone. The appearance of the flame was the same in each case, described a jet of blue fire bursting out of the instrument and filling the room with an odor like that of burning brimstone. In the telephone exchange, where all the wires centre, the flame burst out and filled the room and the clerks left their posts and ran out. Nearly a dozen telephones in the city were more or less shattered, and the next day not an instrument could be worked in the city.

In addition to the appointment of Mr. C. W. Hammond, late superintendent of the A. U., St. Louis, to be superintendent of Jay Gould's Southwestern system of railroad telegraph lines, Mr. Isaac McMichael, formerly assistant superintendent to L. C. Baker, St. Louis, has been appointed superintendent of the Northwestern lines; headquarters at Minneapolis, Minn. Mr. W. W. Cummings, formerly chief operator St. Louis W. U. office, has taken Mr. McMichael's place. Mr. J. H. Topliff has been made day chief, *vice* Mr. Cummings, and Mr. T. P. Cook has been promoted to night chief, *vice* Topliff.

TEXAS & NEW ORLEANS R. R.—This is destined at no distant day to be one of the best roads in the South. We have in Mr. C. A. Burton, Houston, Texas, one of the best superintendents it has ever been my lot to work for. Mr. O. White, train dispatcher, is also a thoroughbred, and well liked by the boys. Then comes R. B. Donaldson, night dispatcher, strictly a first-class man. At Dayton Mr. J. D. Dunks is agent and operator, and G. H. Kitchens, night man. Six miles further east Mr. Moore is agent and operator, and twenty-three miles further Mr. George DeYoung is operator. Just twenty miles still further east is Beaumont, of which Mr. Frank Patrick is manager and A. W. Selvidge night operator.

ROME, GA.—The American Union and A. & P. offices have been closed here. Mr. Milton Orr, formerly of New York, resigned his position as manager of the American Union previous to the consolidation, and accepted a position as clerk and operator for the S., R. & D. R. R., at Dalton. His successor, Mr. C. G. Davidson, has been subbing at different places since the consolidation. He is now subbing for Mr. P. E. Murray, in Atlanta office, that gentlemen taking a month's vacation. The Rome office is managed by Mr. W. H. Adkins, assisted by Mr. John P. Higgins, formerly of Nashville. Mr. C. E. Woodruff has charge of the counter (American District) telephones and messengers, and does good service. The private line of Noble Brothers is manipulated by the Misses Joey Carnochan and Lila Noble. This line is connected with all the depots, steamboat offices, etc., in the city.

A touching scene took place at the Boston office during the last fortnight, upon the resignation of Mr. Joseph H. Twitchell, for the past twenty years superintendent of the delivery department of the Western Union's main office in that city. His departure from the office, on the 11th ult., was signalized by a demonstration of affection on the part of his subordinates and co-workers which cannot but remain the proudest trophy of his life. When the time came for his work to end, the office suddenly filled with employees of the several telegraph offices down town, including managers, receivers, operators, clerks, and, last but not least, boys, and before Mr. T. really noticed that anything unusual was going on, he found himself the centre of a very interesting scene. Mr. Charles E. Davidson, one of the receivers, thereupon presented him, one after the other, a massive silver water-cooler, the gift of the receivers; a photograph album, from the night clerks, whose pictures were within it; a meerschau pipe from the delivery clerks; a gold-headed cane from the eighty-odd messenger boys, and a fruit basket from business friends. The silver ice-pitcher was inscribed "Presented to Joseph H. Twitchell by his many friends, Boston office, W. U. T. Co., June 11, 1881," and the pipe bore the words "Our Chief, J. H. T." The whole affair was the outgrowth of the affectionate regard in which the recipient is held. Mr. Twitchell at length collected himself sufficiently to respond to Mr. Davidson's words, and, all things considered, made a very good speech, but there were "tears in his voice" as in his eyes, and his auditors were all sobbing, so that speech-making was a matter of the greatest difficulty. He will be succeeded by Mr. Henry Murphy, formerly Cashier at the American Union.

## MARRIED.

KIRSCHBAUM—MURPHY.—June 19, 1881, at Brooklyn, L. I., by the Rev. Mr. Hubbell, Mr. Louis N. Kirschbaum, of W. U. Telegraph Office, 195 Broadway, New York, to Miss Sabina K. Murphy, formerly of the W. U., and recently of the A. and P. main office, New York.

## BORN.

AUSTIN.—June 13, 1881, to Mr. W. A. Austin, Albany, N. Y., a son.

BROWN.—May 31, 1881, to Mr. Thos. Brown, operator, Dispatcher's office, P. & R. R. R., Philadelphia, a daughter.

WHITE.—June 12, 1881, to Mr. Howard White, operator Tide-Water Pipe Co., Titusville, Pa., a daughter.

## ZEITSCHRIFT FÜR ANGEWANDTE ELECTRISITATSLEHRE.

Editor: F. UPPENBORN,

Weinstr 5, Hanover (Germany).

This periodical, which appears semi-monthly, contains the latest developments in

Electrical Science, Telegraphy, Telephony, Electric Light and Electro-Metallurgy,

with particular reference to the progress in electricity made in the

## GERMAN EMPIRE.

It is well-illustrated by first-class Lithographs and Engravings, and brings abstracts or lists of all English and German patents.

Subscription Price, M. 20 Yearly (\$5).

Volumes 1879 and 1880 now ready, at M. 24 for both.

Proof numbers can be had free on application.

## TELEGRAPHERS, SAVE YOUR GRIP!

USE THE

## FLEXIBLE KEY-KNOB.

It Relieves the Muscles and is Pleasant to the Touch.

IT IMPROVES WRITING, LARGELY OVERCOMES STICKING OF THE KEY AND FACILITATES SENDING.

It Prevents Telegraphers' Paralysis. NUMEROUS TESTIMONIALS.

No. 1 shows a Flexible Elastic Key-Knob, to be substituted for the present hard-rubber knob; it will fit any key. No. 2 shows an Adjustable Elastic Cover; it will fit any key-knob. No. 3 shows the Adjustable Elastic Cover fitted to the key-knob.

Sent post-paid on receipt of price: No. 1, Seventy-five cents; No. 2, Fifty cents.

Canadian Orders ten cents additional, Postage Stamps taken as cash.

ACTIVE AGENTS WANTED.

It is just what every Learner needs.

THE  
LAW BATTERY.  
—  
THE GREATEST  
TELEPHONE BATTERY.

**PATENT APPLIED FOR**

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz. :

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections *NEVER* corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

**DIRECTIONS FOR USE.**—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

**PRICE, \$1.25 PER CELL.**

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager.  
FRANK SHAW, Engineer.

## TELEGRAPHIC SPECIALTIES.

THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in  
existence. Price, by mail, \$5 00.

THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents  
operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect  
key manufactured. Price, \$5; by mail, \$5.35.

CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

PREMIUM LEARNERS' APPARATUS.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PER-  
FECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery,  
Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late  
Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book  
of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

supplies, and every description of Electrical Apparatus Manufactured and for sale by

PARTRICK & CARTER, 114 South Second Street, Philadelphia, Pa.

## THE OPERATOR,

A JOURNAL OF

Telegraphic, Telephonic and Electrical  
Science, Literature, News and Progress.

PUBLISHED SEMI-MONTHLY.

Subscription, including Postage, \$1 per annum, in advance.  
To Foreign Countries in the Universal Postal Union, 25 cts. extra.

Subscriptions can commence at any time.

A copy of THE OPERATOR will be sent from the  
present time until Jan. 1, 1882, on trial, for Fifty  
Cents. Postage Stamps taken.

THE OPERATOR in effect sends each of its subscribers a long  
letter twice a month, containing all the telegraphic, telephonic  
and electrical news of interest to him that has occurred during  
the preceding two weeks, and also gives him in each issue sev-  
eral articles of great value on matters pertaining to his profes-  
sion, from the pens of the most able and astute writers con-  
nected with the telegraph and telephone business.

"Such a paper is only possible among an intelligent staff of  
men, such as work the American lines."—Telegraph in  
America.

For TWO DOLLARS we will mail, prepaid, "The  
American Popular Dictionary," "Tales and History" (both  
cloth) and THE OPERATOR, until Jan. 1, 1882.

Or, for the same amount, we will send "Sam Johnson,"  
"Tales and History" (both cloth), and THE OPERATOR,  
until Jan. 1, 1882.

"Tales and History," "Wired Love," "Oakum  
Pickings," The Dictionary, "Lightning Flashes,"  
"General Grant," and "Sam Johnson," all  
cloth, with THE OPERATOR one year (regular  
price \$7.50), will be forwarded, prepaid, to any  
address on receipt of \$5.

## SPECIAL AGENTS' OUTFIT

Experience has demonstrated that the best selling books  
we publish are

TALES AND HISTORY,  
THE DICTIONARY,  
WIRED LOVE AND  
OAKUM PICKINGS.

That agents may be equipped for taking orders at an in-  
significant cost, we will send all three of these  
books, for use as samples, prepaid, on receipt  
of \$2.50.

No. 9 MURRAY STREET, NEW YORK.

# The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer.  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

## District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

## PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

SIMPLICITY AND EFFICIENCY

## In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

ADOPTED AND USED BY THE  
American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

40 West 18th St., New York.

TO

### AMERICAN BELL TELEPHONE CO.

Magneto, Battery Bells, Etc.

We manufacture and deal in all kinds of Telephone and Telegraph supplies, and at the lowest possible prices.

Owing to changing our Telephone system from Battery to Magneto, we have a large lot of our handsome nickel-plated bells, which we have put on new bases, removing all telephone connection, and will clear out at much less than cost of manufacture. They are wound to 30 ohms, with best silk-covered wire. Gongs are 3 1/4 in. diameter and very loud, working parts incased in nicked covers—which you like, either vibrator or single stroke.

Every part of our Standard Magneto Bell is guaranteed interchangeable, so agents can readily make their own repairs.

Line and Office Wire of all kinds and sizes; Brackets, Locust and Oak Pins, Insulators of every design; Gravity and other Batteries, of every description, at greatly reduced prices.

Correspond with us before going elsewhere. Samples sent on application to authorized persons.

Our "Prince of Learners" Students' Outfit, at \$4.30 complete, is still in the lead, and unexcelled in quality, and full money's worth. Send for our catalogue.

### THE MAGNET AND CHURN.

A magnet hung in a hardware shop,  
And all around was a loving crop  
Of scissors and needles, nails and knives,  
Offering love for all their lives;  
But for iron the magnet felt no whim—  
Though he charmed iron it charmed not him—  
From needles and nails and knives he'd turn,  
For he'd set his love on a Silver Churn!  
His most æsthetic, very magnetic, fancy took this  
turn—  
"If I can wheedle a knife or needle, why not a  
Silver Churn?"

And Iron and Steel expressed surprise;  
The needles opened their well-drilled eyes;  
The penknives felt "shut up," no doubt;  
The scissors declared themselves "cut out;"  
The kettles they boiled with rage, 'tis said;  
While every nail went off its head,  
And hither and thither began to roam,  
Till a hammer came up—and drove them home.  
While this magnetic, peripatetic lover he lived to  
learn,  
By no endeavor can magnet ever attract a Silver  
Churn!

*From the new opera, "Patience."*

### The Blake Transmitter.

Who, in these latter days of electric mental and physical light, has not seen and spoken to the Blake transmitter?

It was the legitimate offspring of the microphone. The years from 1875 to 1880, or, in point of fact, from 1875 to the present time, comprise a wonderful series of electrical and electro-mechanical successes.

The microphone, like all peculiarly great and successful inventions or discoveries, has had many would-be inventors. But the glory has been almost without question given to Professor Hughes, who certainly was the first to give to the world the knowledge of the wonderful instrument.

Less widely known, but, in the opinion of many who should be well informed, fully as well grounded, are the claims of Emile Berliner to recognition as the first microphonic inventor.

It is not our purpose, however, at the present time to decide an interference case on the respective merits of Messrs. Berliner and Hughes—and perhaps, to complete the trio, we should also say Edison, since at one period he, too, vehemently asserted his own inventorship—but only to trace the pedigree of the Blake transmitter have we opened the vexed question.

In May, 1878, Mr. Hughes gave his invention to the public and awakened anew the interest in such matters which after the introduction of the phonograph had to a certain extent become torpid.

The adaptability of the instrument to become a sender or a loud speaker for the telephone, which at this time was quietly working its way into active service, struck the practical mind of

Mr. Francis Blake, a gentleman of an inventive and experimental turn of thought. The same idea also appears to have occurred about the same time to many other minds; but to the application of Mr. Blake, assisted by several experts of the Bell Telephone Company, was the reward given.

As before mentioned, in May, 1878, was the microphone first made public, and as early as August, 1878, was the Blake transmitter produced. Its intrinsic merits at once made it a great commercial success, and at the present time about 50,000 instruments are in active operation.

We will now enter upon the method by which the Blake transmitter speaks. Many persons suppose that it is but a modification or variety of that class of battery telephones in which the oft-repeated principle is involved, namely, "the variation in resistance under pressure" possessed by many substances, and notably by carbon. It is not so, however. The only resemblance between the two types, both excellent in their place, is that both act by varying a resistance placed at some given point in a battery circuit.

Every Morse operator must have noticed repeatedly that when he has pressed his key very lightly, so as to make an uncertain contact, the relay and sounder have shown a disposition to chatter, while when pressed firmly the relay and sounder have worked firmly. This is, of course, due to the fact that when the key is lightly pressed the resistance is great between the points, while when firmly pressed the resistance is much less. The transmitter contact is precisely like this. Its work depends on the electrical properties of a bad joint; that is, upon the fact that the electrical resistance which the current experiences, in passing from one electrode to the other, varies inversely when the pressure between them varies, and upon the further discovery that they can be so mounted that the motion given by sound waves will produce corresponding variations of pressure to a useful extent without breaking contact—any absolute break of contact being fatal to the transmission of speech.

The essential operating part of the Blake transmitter lies in the contact of the two electrodes, through which the current passes. The minute movements of one of these toward and away from the other, under the influence of sound waves, causes variations of pressure which affect the strength of the current. These variations occur about 400,000 a minute, and we repeat that it is requisite that under these variations the electrodes shall not, even for the most measureless instant of time, part company.

Everybody knows what the Blake transmitter looks like; an extremely plain-looking box of the brownest of black walnut, with a lid or door opening on hinges and provided with a lock, the key of which, only on very rare occasions, succeeds in unlocking the door of any other individual transmitter. On one side of it is an inscription so loaded down with a list of patents that it is no wonder that the average lineman sets up the instrument with an inclination to that side. Not much to look at. The internal arrangements are scarcely more inviting than the outside. Screwed on to the cover is a ring of cast iron, which carries a cross bar or spring lever, to which at its upper end is attached a square block of non-conducting material. In this are inserted two springs, one of which is very light, the other comparatively heavy. At its lower end the lever is controlled by a screw. The diaphragm is insulated by a ring of rubber fixed around its edge. It is held on one side by a brass clamp and on the other by a steel spring with a little rubber glove on its end where it presses on the diaphragm. The light spring, previously referred to, carries at its lower end, which reaches to the centre of the diaphragm, a little piece of platinum, which touches the diaphragm on one side, and the middle of a button of hard gas carbon, which depends from the heavier spring on the other side. Four primitive looking binding screws may be seen inside at the top of the back of the box, and a small induction coil stands in one corner, as if it had been a bad boy. The primary or inside coil has a resistance of about  $2\frac{1}{2}$  ohms, and the secondary or outside one, which is made of fine wire, has about 250 ohms resistance. It will be noticed that here are two totally distinct circuits—first, the primary circuit from the carbon of the Leclanché battery to binding post No. 1, starting from the left side of the instrument; thence to the hinge and carbon button, through the carbon to the platinum, up the light spring to the cast-iron frame, from that to the lower hinge and to one wire of the primary coil, through that coil and out by binding screw No. 2 to the zinc of the battery. The other circuit is much simpler. The two wires of the secondary coil are connected, respectively, to the binding posts 3 and 4, which are connected in the line circuit. For example, the incoming line may be connected to screw 3 and screw 4 through the telephone to earth. In practice it is usually connected to marked screw-posts of a magneto bell.

It is rather singular that the precise reason for the employment of an induction coil in this

instrument does not seem to be generally known. It is not only because induced currents have a much greater tension, and consequently a much greater power of overcoming resistance, but also, and chiefly, because it has been found that although the range of variation at the point of contact when the diaphragm is spoken against is great and almost infinite in a short circuit, where a slight change of resistance is an important factor, it amounts to but a very small thing in a long circuit, where the external resistance is large to begin with. The induction coil overcomes this difficulty.

The resistance at the point of contact controlled by the diaphragm is constantly changing under the influence of the voice, and with each change a current in one direction or the other is propagated in the secondary coil by current induction, which current goes over the line to affect the receiving telephone at the distant end. The transmitters are always tested before they leave the shop, and unless in good order are not sent away. It may here be remarked that the light spring carrying the platinum point is called the normal pressure spring, gets other the carbon spring.

To adjust a transmitter, slack down the screw at the bottom of the level until the platinum point just touches the diaphragm, then turn upward one full turn. This will usually bring the tone to its best condition. If when you speak rather loudly at a distance of three inches from the mouthpiece it "breaks," turn it up a little more, if it be faint or muffled, turn it a little back. If the carbon is pulled backward the platinum should follow it nearly half an inch. It is a very unfortunate thing that the average inspector has a rabid desire to lay every trouble upon the transmitter. The truth is that it is a most harmless instrument and much more desirous of working properly than improperly, if it only has the slightest chance.

Inspectors of telephones, however, are much like the scriptural virgins, only instead of being evenly divided, half of them wise and half foolish, as a rule five of them are wise and forty-five foolish. The forty-five, when they visit a telephone subscriber, make it an invariable practice to do so with no oil in their lamps, and as the transmitter is a convenient instrument, it is generally credited with the trouble; and, moreover, as it is quicker and easier to take it out and put a new one in than to discover and fix the trouble, that is the procedure usually adopted.

The following are troubles likely to arise in the transmitter, with their remedies.

Trouble in secondary coil. This shows by appearing as if the whole arrangement had given out. Neither speaking or listening can be accomplished.

Examine the binding posts 3 and 4 and the fine silk covered wire leading to those posts from the coil. If you discover the fault, common sense will tell you how to fix it. If you don't find it, disconnect the outside wires from the binding screws and twist them together, then talk and listen with the telephone alone. If you succeed in doing so, it proves the trouble to be in the secondary coil. A dead certainty may be given to this test by now connecting binding screw 3 to one pole of the battery, the other pole of the battery to one wire of the telephone cord, attach a long wire to the other wire of the telephone cord, then touch screw post 4. If you hear a click, you have made a mistake and the trouble is not in the transmitter but in the call box. If not, touch at different points along the silk covered wires, first baring them a little. If the trouble is thus discovered, you can probably splice it; if not, the trouble is in the coil and the coil must be changed.

Trouble in primary circuits shows by the listening coming all right, while the transmitter will not say anything.

It may be caused by several different things; screw post loose, either No. 1 or 2; wire in primary coil broken; loose connection on the primary circuit, where it goes through the call box; the platinum point does not touch the carbon; the small spring may touch the large one above the contact point; the battery may be weak or otherwise out of order. These faults may be mostly found by inspection.

Remedies for the first, screw them up. Second, test for break with battery and long wire if everything else fails. If the break proves to be inside the coil, the coil, as before, must be

changed. Third, examine all the connections in the call box. Fourth, screw up the adjustment until the platinum does touch the carbon, then adjust according to rule previously given. Fifth, gently bend the springs until they come to their proper position.

If the battery be weak, it may be detected by placing the telephone to the ear, after carefully examining every connection, and then gently drawing the carbon from the platinum. If the click at breaking and closing is not loud and strong, the battery is probably out of order and must be looked to. A good inspector will assure himself of that fact by an examination of the battery first thing.

Sometimes the talking will become weak after a few days of warm weather. This would be likely caused by the rubber glove on the end of the damping spring becoming soft.

Remedy—Insert between the rubber and the diaphragm a thin piece of silk, cloth or paper.

Occasionally the transmitter makes a continual humming noise. This may be caused by the adjustment being too low, or by the battery being too strong. In the first case, screw it up a shade. In the second, press the diaphragm through the mouth piece, to stop it temporarily, and either wait with patience till the battery gets a little older, or for the time insert two or three ohms resistance in the battery circuit.

If the tone from being good, becomes weak, and at the same time harsh and raspy, it is caused by the platinum wearing the surface of the carbon rough at the point of contact.

Remedy—Carefully unscrew the carbon and rub it on fine emery paper until the polish is once more even and good. Finally, as in all electrical apparatus, when a transmitter is working well, leave it alone.

#### Union of the Telegraph and Postal Services.

This subject is discussed by a Mr. A. B. Huet in the July number of the *Popular Science Monthly*. The arguments in favor of a government monopoly of the telegraphs are similar to those put forward by other writers on the same theme.

In determining the question as to whether the United States should constitute this means of communication a part of the general postal system, Mr. Huet says the first important consideration is, whether such action is authorized by the Constitution; secondly, whether such control has proved a success in the several countries where it is thus organized; and, finally, whether a beneficial result is likely to follow from similar action in this country.

As to the first proposition, he continues, there can be no doubt. That clause of the Constitution wherein this authority is granted is found in section 8 of Article I. in this language: "Congress shall have power . . . to establish post-offices and post-roads." By this comprehensive and explicit declaration, the framers of the Constitution, without doubt, intended to lodge with the general government the exclusive privilege of regulating and conducting the transmission of intelligence among its citizens—in other words, the intent was to give to the general government the exclusive monopoly of the postal service, by which was meant the interchange of intelligence, not only by the methods then in use, but also by the use of improved methods thereafter devised and adopted. This opinion is sustained by the decision of the Supreme Court in the case of *The Pensacola Telegraph Company vs. The Western Union Telegraph Company* (6 Otto), in which the Court says: "Post-offices and post-roads are established to facilitate the transmission of intelligence. Both commerce and the postal service are placed within the power of Congress, because, being national in their operation, they should be under the protecting care of the national government." That these views are sound is too plain to be doubted. Continuing, however, the Court touches upon the very point in question—the telegraph: "The powers thus granted are not confined to the instrumentalities of commerce, or of the postal

service; known or in use when the Constitution was adopted; but they keep pace with the progress of the country, and adapt themselves to the new developments of time and circumstances. They extend from the horse with its rider to the stage-coach, from the sailing-vessel to the steam-boat, from the coach and steamboat to the railroad, and from the railroad to the telegraph, as these new agencies are successively brought into use to meet the demands of increasing population and wealth. They were intended for the government business to which they relate, at all times and under all circumstances." It was impossible for the men who framed the Constitution to foresee the wonderful improvements in the means of rapid intercommunication which have since taken place. At that time there were only a few post-roads in the United States, and over these the mails were conveyed on horseback or in the stage-coach, consuming a fortnight in the trip from Boston to Philadelphia, that is now made by the fast mail in a few hours. In the progress of events, the people demanded a quicker means of communication, and the government did not hesitate to place the mails upon the railroads as fast as they were constructed. Now, in many instances, the railroads are too slow to meet the demands of business communication, and the telegraph is freely used in all important commercial transactions. The business man who does not use the telegraph each day for information as to markets abroad, to make contracts with distant customers, to transmit money, and in various other ways, is counted slow indeed in this age of progress. From these facts, is there not the more reason for making this wonderful and powerful agency subservient to the general postal system of this great and growing country than there was for providing for the carriage of the mails by steam?

Further, it is not only a constitutional privilege, but it is also a constitutional duty; and it is susceptible of the strongest proof that, in neglecting to make the telegraph a part of the postal system, the government has failed of its constitutional duty toward its citizens. Such powers as are granted to the general government are granted absolutely, and are lodged nowhere else. In the language of the tenth amendment, "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." It may not be improper to observe here that only such powers were granted to the general government as could not properly be exercised by the States. For instance, the right to declare war was granted to the general government, and wisely, else New York might declare war against some foreign power, while the remaining States might be strongly in favor of peace. It is, therefore, fair to infer that such powers as were granted to the general government were not "reserved to the States respectively, or to the people;" and in this class, as we have seen, is the power to regulate and control the transmission of intelligence. In the language of Mr. Justice Field, in *ex parte Jackson* (6 Otto), "The power possessed by Congress embraces the regulation of the entire postal system of the country." It extends to the telegraph as well as to the railroad, and the conveyance of letters and packets by regular trips over railroads by private parties is prohibited by law (Revised Statutes, sections 3,982, 3,983), yet we permit a private monopoly to convey our messages the quicker way by telegraph. The government enforces a monopoly of the transmission of intelligence by the slower methods, but when the lightning is invoked that is left to the monopoly of a single private corporation, contrary to the true intent of the Constitution.

The postal telegraph system has been adopted in Belgium, Switzerland, France, Russia, Germany, Sweden, Italy, New Zealand, and other countries, with the most gratifying results in each case. Great Britain, usually so quick to adopt reforms in the postal service, and to which government we are indebted for various improvements in our service—the postage-stamp, money-order, postal-car, carrier-system, postal-card, etc.—was the last of the European countries to establish the system. Previous to its introduction there, the Chambers of Commerce memorialized Parliament in favor of the measure, alleging that they "had reason to complain not

only of the high rates charged by existing companies for the transmission of messages, of frequent and vexatious delays in the delivery, and of the inaccurate rendering, but that many important towns, and even whole districts, are unsupplied with the means of telegraph communication." In moving leave to introduce the postal telegraph bill, the Chancellor of the Exchequer said: "We were in the habit in this country of leaving to private enterprise the administration of internal affairs, the exception to the rule being that of postal communication. With the consent and approbation of the country, this was a monopoly in the hands of the government; and he submitted that telegraphic communication and postal communication might be considered as coming within the same category, as both provided for correspondence between persons at a distance, and the only difference was the mode of communication. It would be admitted, as a general principle, that the monopoly which had succeeded so well in regard to the conveyance of letters might be expected to succeed equally as well in a more rapid method of communication. He was not aware of monopoly in the one case which would not hold good in the other." The reasoning of the distinguished chancellor applies with greater force to this country, where the rates are higher than they were at that time in Great Britain, and where the entire telegraph system is in the hands of a single private corporation. The transfer of the telegraph business to the government in Great Britain took place February 5, 1870, and in 1872 there was a net revenue from this source of £159,835, which increased in succeeding years.

In conclusion, Mr. Huet thinks that there is no reason to doubt that the success which has attended the system in other countries would obtain in the United States, especially when we consider the energy and enterprise of our countrymen, and the extent and resources of our great and rapidly developing country; and that with a uniform tariff, say of twenty cents for twenty words or less, it could be made in a few years to cover all expense, if not (which is probable) a source of revenue to the government. That the near future will witness this realization, Mr. Huet adds, is quite certain.

#### Telegraphy as a Specialty.

Among the useful arts there is none at the present hour of wider application or more beneficent in results than telegraphy. It has already become a prime factor—a necessity—in the commercial, social, literary, political and moral departments of human life. And its birth and development have been so sudden—so like the descent of a beneficent spirit to earth from the celestial realm, that the human mind has not yet adequately realized and appreciated the supreme benefits that directly and secondarily result from its advent. For it has not only entered and permeated as a recognized necessity every relation subsisting between individuals and nations in every department of human existence, but it has compelled the organization of a new school of specialists, by which its processes and requirements are executed.

There is no occupation in the whole range of civilization demanding a more intense mental tension, greater precision, greater aptitude in rapid execution, with an ever present consciousness of great responsibility, than that which falls to the lot of the telegraph operator. An error in the transmission of a single message may wreck a lightning express with its precious freight, or commercially uproot a fortune; and there are but few individuals that can bear this great mental burden for any considerable length of time without giving way, in a greater or less degree, to the pressure. We believe the brain and nerve waste in the system of the telegraph operator is greater in proportion, in a given number of hours, than in any department of scholastic or professional life. And this waste

must be promptly repaired by proper nutrition or food, or the most deplorable results will follow.

Already thousands of victims have fallen; their place being eagerly sought for and filled by youthful aspirants unconscious of danger. In any department of human endeavor a sedentary life, joined to severe mental tension and a sense of great responsibility, is full of peril to the physical system. In such a case the brain and nerves are not only sure of being overtaxed, but for want of proper exercise the natural equilibrium is destroyed between the muscular tissue and the nervous systems. In such a case the victim loses his appetite, the tissues of his body waste, and his mind becomes morbid, irritable, fretful and gloomy. Often the diet of such an individual, if he indulges too freely in carbonaceous and nitrogenous food, increases the difficulty. The telegraph operator must have pure air, proper physical exercise, and an abundance of brain and nerve-sustaining food, if he would escape the evils to which his daily task expose him. Already a specialist in dietary science has elaborated a Food Cure System admirably adapted to meet the wants of an overtaxed mind and body. That thousands of physicians find in the brain and nerve-sustaining power of the Blanchard Foods an efficient means to sustain and repair the broken down mental and physical energy of their patients, is a sufficient guarantee of their merit and value. Thus it is that as soon as a new departure in science creates a new want, science in another department exhibits her infinite resources in its prompt fulfillment.

#### Recent Advances in Electric Lighting.

BY W. H. PREECE.

Advances have been made, not so much in electric lighting itself as in the popular favor with which it is regarded. The public is becoming more accustomed to its use, and is acquiring more confidence in it. The result of trials during the last year or two has been to make the defects of the electric light better known. It has been taken out of the experimental stage, and brought within reach of the practical stage. The principal fact which has brought the electric light to the front has been the substitution of machinery for the direct conversion of mechanical energy into electricity for the expensive batteries which were the only sources a few years ago. Machines, working with high velocity, great steadiness, and uniform pressure, have solved the problem of cheap electricity. The amount of coal required to produce one horse-power has been reduced from seven and eight pounds to three and even two pounds. The gas-engine—a very economical source of energy—has been successfully applied to electric lighting in many places. Such an engine has been used at the docks in Newport, South Wales, to produce a light of eleven times the power that the same gas would give if used directly. Here is a sphere in which gas companies may maintain their dividends. Water furnishes a convenient source of energy wherever it can be found available. Sir William Armstrong makes his brook light his house, producing from it, by the aid of a turbine, a force giving six horse-power. The caloric engine at the Lizard lighthouse has been found to be economical, useful, and very suitable for an isolated place where it is hard to provide water.

The forms of arc-lamps are very numerous. In every case carbon rods are opposed to each other, and are disintegrated and consumed in the fierce blast to which they are subjected. The lower pole—the negative—acquires a temperature of

3,150° C. (5,702° Fahr.), and is broken up and fired in a fierce bombardment of white-hot molecules across the air against the upper pole—the positive—which is beaten up by incessant impacts into a higher temperature of 3,900° C. (7,052° Fahr.), the arc itself being 4,800° C. (8,672° Fahr.). A number of ingenious appliances have been adopted to obtain steadiness and uniformity in the action of the arc, which is liable to variations arising from the irregularity in the character and consequently in the consumption of the carbon, and from variations in the strength of the current. We want brilliancy combined with absolute steadiness, and a durability equal to the length of a winter's night. All the improvements that have been made in the arc have not given a silent and steady light.

The incandescent light is free from many of the defects of the arc-light. In it we have something that is beautifully soft, absolutely noiseless—a light that brightens up nature in all her true colors and purity. It, however, requires considerable expenditure of power, and is at present an expensive luxury. Sir William Armstrong finds that six horse-power will supply thirty-seven lights, giving altogether the illumination of nine hundred and twenty-five candles. The same power applied to arc-lights would give more than six thousand candles. But rapid progress has been made in this field. Maxim, Edison, etc., in America—Swan, Lane-Fox, and others, in England—are working hard; while Gordon and Joel are working in an intermediate field, in which a prospect appears of a happy compromise being effected between the arc and incandescence.

Some wild statements, involving wonderfully divergent estimates, have been made about the light-giving power of the different lights. A standard sperm-candle, although it may be a good unit to measure gas by, is a very poor standard for the electric light. None of the various modes of measurement in use seem to apply exactly to this light, and the standard of measurement of the future has yet to be found. Much is said about the subdivision of the electric light by certain gentlemen, who hope to distribute it throughout our houses from one central spot, and furnish it cheaply and abundantly in our cities. I am one of those who do not believe in the impossible, but I say that, with our present knowledge, this problem is unsolvable. Sir William Armstrong can only keep thirty-seven lamps going; Lane-Fox could only show twelve lights; Professor Adams could only produce from the most powerful dynamo-electric machine, by calculation, one hundred and forty lamps. Where is the subdivision? The advocates of subdivision assume an inexhaustible source of electricity. Their opponents reply that there is but a very limited source of energy in every dynamo-electric machine. It may be that more powerful machines and lamps of lower resistance may enable us to light up a greater number on one circuit, but this is not subdivision, it is multiplication.

Nearly three hundred Gramme machines are in use in England generating light; there are many more Siemens machines, and the Brush people have installed many machines and lights. Nearly all the ironclads in the navy are supplied with the electric light. In libraries, while reading by gaslight is irksome, reading by the electric light is simply delightful. Railway stations are gradually adopting the lights; seaside resorts are illuminating their parades with them. It would be impossible to make any summary of the numerous manufacturing establishments that have been supplied with lights worked successfully.

Notwithstanding these great advances in its use, it must not be forgotten that the electric light has its defects and its advantages. The intense shadows that it occasions are troublesome. The unsteadiness of the light is at times wearisome. The hissing which impurities in the carbon and irregularities in the current produce is tantalizing, and the light has an unfortunate habit of misbehaving itself when it is most wanted. Moreover, the problem of durability remains yet to be solved. Many have tried the light and abandoned it. In some cases its economy is unquestionable, but there are places where careful persons have shown that gas, as regards economy, surpasses it. It is questionable whether, in some cases, the electric light does not affect the eye. The arc-light produces, also, nitrous acid and

other deleterious gases, but the incandescent lamp is free from this trouble. The powerful currents that it requires can not be carried over buildings and rooms without incurring danger from fire and to life. Nevertheless, the light has great and manifold advantages. The brilliancy of a well-lighted room is simply enchanting. The purity of the light for the transaction of business, the selection of colors, and the ordinary daily avocations of life, is simply superb. Its cleanliness is one of its great merits.

#### Another Decision for the Western Union.

On Friday, July 8, Judge Blatchford, of the United States Circuit Court, handed down a decision in the case of the French Cable Company against the Western Union, American Union, Atlantic & Pacific and the other telegraph companies, asking the Court to invalidate the agreement of consolidation made December 18, 1880, on a re-amended bill of complaint, in which he says:

I cannot regard it as an open or a doubtful question that the consolidation agreement was valid, whether considered with reference to the general principles applicable to it or to the statute of New York, or to the act of Congress. But it is contended for the plaintiff that that agreement is in violation of the rights which the plaintiff has under the contract between it and the American Union Company. There is nothing before the Court to enable it to measure with the least approach to accuracy, or otherwise than by the merest fancy or conjecture, the extent or the pecuniary value of those rights which extend at most only to unconsignéd messages, or the pecuniary amount of any damages, either past or probable in the future, from the violation of these rights. On the other hand, it distinctly appears that the controlling reason operating with the American Union Company in selling its property was the great disadvantage in pecuniary results of continuing its business as an independent company in comparison with the advantage to its shareholders of becoming such in the Western Union Company. When to this is added the fact that by the pooling or joint purse arrangement existing between the plaintiff and the other two cable companies it makes no pecuniary difference to the plaintiff whether all messages are sent over the plaintiff's cables, or whether all are sent over the cables of one or both of the other two cable companies, it is plain that the injury to result to the American Union Company from preventing the carrying out of the consolidation agreement is far greater than any possible injury to result to the plaintiff from a contrary course, and that therefore the case is not one for equitable interference in that regard.

If hereafter damage is shown to result to the plaintiff from sending by the Western Union Company of unconsignéd messages over some cable other than a cable of the plaintiff, it may be proper to ask the interference of a Court of Equity. In such case the question whether the agreements between the French Cable Company and the American Union belong to a class of which specific performance will be decreed and the question whether the remedy at hand is complete, adequate and plain, and the further one as to what control the Court would have over the plaintiff to compel it to observe the agreement on its part, will come up for consideration. The motion for an injunction to prevent the carrying out of the agreement of consolidation is therefore denied.

#### The New York Wire Club.

The gray sky wears again its gold  
And purple of adorning,  
And manhood's noonday shadows hold  
The dews of boyhood's morning.

President Borst called the meeting to order, and announced that Professor Weller would play a few symphonies on the organ while the regular collection was being taken up by Gilley Olmstead and Denis Brown, of the committee on finance.

Mr. Weller's execution of Mozart's weird music produced a startling effect upon the audience, which vented its delight in loud and repeated

cheering from the body of the house, while the overcrowded galleries sent forth hoarse shrieks of approval, completely drowning the minor passages of the piece. Mr. Weller's marvelous fingering, however, could be seen if not heard, and the whole performance was heartily enjoyed by an audience that kept excellent time with its feet.

At the conclusion of the grand finale, in which Mr. Weller introduced his imitation of a milk wagon thundering over Paterson Bridge, the house rose and sent up a deafening volley of cheers.

Walter Richmond inquired if any one had seen the score of the last walking match, and proceeded to relate many incidents connected with recent sporting events. Time was called at the end of the allotted ten minutes, but Mr. Richmond refused to yield the floor. Confusion reigned supreme for some time, Mr. Richmond finally giving way with the remark that he was "more chinned against than chinning."

Mr. George Walcott volunteered to sing, if unanimous consent could be obtained; but great opposition was manifested by the faction controlled by the Half-breed leader, Giles N. Howlett, who made a vigorous speech denouncing the Stalwarts.

Mr. Howlett's peroration was exceedingly fine, and brought tears to the eyes of all.

Notwithstanding the Half-breed opposition, President Borst, in direct contravention of parliamentary rules, decided that, as he was in a musical mood, he would either hear Mr. Walcott's song or adjourn the meeting. Much discontent was expressed at this arbitrary ruling, and Gisborn Ward threatened to draw up articles of impeachment against the President.

Mr. Walcott then sang "Dame Margery" in such a manner that pen and ink would fail to do justice to the effort.

A ballot for Secretary was taken with the following result: Giles Nero Howlett (Ohio), 278; Gisborn Ward (Newfoundland), 222; John Lenhart (New York), 1.

Mr. Howlett was declared elected.

The next meeting was called for Aug. 1. Mr. Howlett will talk and Mr. Walcott will sing.

#### An Important Suggestion.

Professor John Trowbridge has suggested to the government that the universities along the Atlantic coast, from Boston to Baltimore, should co-operate with the signal Service in establishing stations to observe the electrical state of the air. He says: "Very little is known in regard to the electrical state of the atmosphere; and no systematic observations of it are taken in America. It is well known that northwest winds along our northern coast are usually accompanied by a positive charge of the atmosphere, and east winds by a negative charge, or the absence of any appreciable charge. The coming of these winds can be predicted to a certain extent by observations on the electricity of the air. The approach of thunderstorms is also heralded in a clear sky by the delicate instruments which have been lately constructed. Since our knowledge of meteorological phenomena depends upon simultaneous observations extended over large areas, a number of stations for observing the electrical state of the air should be established in connection with the Signal Service. By a simple plan of co-operation with the Signal Service, Harvard University, Yale, Columbia and Princeton colleges, the University of Pennsylvania, and the Johns Hopkins University could enable the United States Government to try the experiment. These institutions form a cordon of nearly a thousand miles along the Atlantic coast where commerce is most active.

Chief Signal Officer Hazen has replied that the Signal Service would very willingly work in accord with the scientific men on the Atlantic seaboard in undertaking the experiments proposed, if the universities should take concerted action and ask the government's co-operation.

An omnibus run by electricity is announced to ply between Zehlendorf and Teltow at Berlin. The vehicle is similar to a four-wheeled bus, with room for ten people.

#### Answers to Correspondents.

If two wires, one connected with a battery, be moved, will the induced current in the secondary wire continue to flow as long as the wires are moving, or is it instantaneous on the starting and stopping of motion, the same as if the battery circuit were interrupted?

A. D. A.

The induced current is caused by any change in the relative position of the two wires. It follows, then, that the current will exist in the secondary wire as long as the inducing wire is being moved either nearer to or further away from it when they are sufficiently near each other to be inductively influenced.

I work two cells of Callaud battery on my local. When main line is cut out, and with a certain adjustment of the relay, its tongue will begin to vibrate, and thus open and close the local circuit, and continue until the adjustment is changed or main line cut in. Please explain the cause through the columns of THE OPERATOR.

L. A. R.

This will occur when a relay is adjusted very low, and when there is very little tension on the spring. With such an adjustment, when the main line is cut in, the magnet holds the armature firmly up; but as soon as the cut-out is put in, the attraction of the relay ceases, and the very slight tension of the spring pulls back the armature tongue. The tension, however, is so very slight that the armature is not permanently retained, and, being almost perfectly balanced, it vibrates on its centres in the manner indicated.

Would you kindly inform me in the next issue of your paper how I am to proceed in order that I may join the Military Telegraph service? I have about seven years experience as operator both in this country and in England, but always had a very strong desire to join the military service. I read about 25 words Morse and am a steady, sober sort of fellow. You may, perhaps, wonder why I do not remain where I am, for I am with the W. U., but they are beginning to get things down to so mean a point since the consolidation that I am heartily sick of the whole business.

E. H.

Operators now in the U. S. Military Telegraph service do not recommend the same very highly. Your post of duty would in all probability be away out on the frontier some place, where, if you are fond of solitude, you could indulge your fancy in that direction to an unlimited extent. By writing to the chief signal officer, U. S. A., Washington, D. C., you can get all the information you may need in reference to joining the service, rates of pay, chances of promotion and the like.

#### Simplification of Telegraphy.

A device has been perfected by H. M. Albee, of West Oakland, by which any one who knows the alphabet and how to spell can correctly transmit telegraphic dispatches. The invention is a substitute for the key, which requires training in order to be used. It consists of a piece of metal in which are inserted conductors of brass and non-conductors of whalebone to correspond with the characters of the Morse alphabet. Each letter or numeral is divided off and marked. By moving a metallic pencil over any one of these divisions, the particular letter or figure is reproduced at the other end of the line by means of the insulations and connections. One stroke suffices for a character, while greater precision is obtained than by the key, as on account of the mathematical accuracy of Mr. Albee's device letters or numbers cannot be run together as now too frequently occurs. The invention was tried yesterday between Oakland and Sacramento, and, considering the briefness of the test, gave satisfaction.—*San Francisco, Cal., Chronicle.*

Mr. E. Clemons Hoagland, formerly with the A. U., at Chicago, is a recent addition to the Binghamton, N. Y., W. U. force.

## Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 140. Describe some of the best or most generally employed insulators?

A. The unprotected glass insulator, which is in almost universal use in this country, naturally takes precedence with an American writer.

Though perhaps not so perfect an insulator in many respects as some others, its low price, more than fair insulating properties and easiness of attachment, enable it to maintain its place in the front rank.

As made now, it has a screw thread on the inside, by which it is secured to the bracket or pin. The under side below the screw swells out, and the concavity thus formed keeps always a certain amount of dry surface and prevents an escape in wet weather. The line wire is passed alongside the groove surrounding the insulator near the top, and is fastened with a tie wire, which passes around the insulator, while both of its ends are twisted around the line wire.

The glass insulator with an iron covering is used to some little extent in the United States. It has no particular features, except those indicated by its name. It is to be objected to chiefly because when an insulator becomes defective it is a very difficult matter to discover the defect; and, moreover, it has been ascertained that when such insulators are used the percentage of leakage is comparatively high.

Next comes the brown earthenware insulator, which is in general use in England. It is composed of two separate cups, the smaller of which is fitted into the larger, and is fastened by a cement consisting of equal parts of fine sand, cement, and plaster of Paris. The iron bolt is galvanized, and is fixed in the inner cup by another cement, which is invariably composed of 5 parts of clean sand, 3 parts ashes from a locomotive fire-box, and 2 parts pine resin. A groove is on the upper part of the insulator, and in this the line wire is bound, in a manner similar to the glass insulator.

It may be well here to state that sulphur is not a good insulator cement, as it splits the insulator, apparently by expansion.

The Brooks insulator is in many respects an excellent one, and gives very satisfactory results, especially in localities where insects are scarce. It consists literally of an iron wire-holding hook, cemented into a blown glass bottle, which is inverted, so that the hook hangs down. The bottle is cemented into a cast-iron shell, which is either provided with an arm that screws into the pole, or, if to be placed on a cross-arm, is arranged with a projecting piece, whereby it may be inserted into a hole on the under side of the cross-arm, and locked by a pin which is passed through the cross-arm and engages the projecting piece.

The remarkable insulating properties of this combination are due to two causes; first, the liberal use of paraffine, with which the cement is saturated and, second, the great power of repelling moisture which blown glass has.

The last insulator which it is necessary to mention is the "rubber hook." It is simply an iron hook whose shank is firmly fixed into a mass of hard rubber. A thread is cut on the rubber for screwing into cross-arms.

On account of its great mechanical strength and convenient form, it is much used on short city lines. Its high price and the deterioration of its insulating qualities after a few years use prohibit its use on long lines.

Q. 141. What is usually the material of the conductor in aerial lines?

A. The material of which aerial conductors are made is now almost universally iron. The best wire is made of charcoal iron, which, after being drawn, possesses a high degree of tough-

ness. Line wire should invariably be galvanized. Iron is selected as the best conductor because it is cheap, durable, has a reasonably low resistance to the passage of electricity and has great tensile strength. Copper, on the other hand, cannot be ordinarily used, because it only has one of the above qualifications in a superior degree to iron, that is, "low resistance." In that it is much superior, a wire of copper conducting as well as a wire of iron six times its cross section. For this reason it is exclusively used in submarine cables. Its disadvantages for land lines are its intrinsic value, which renders it at all times liable to be cut down and stolen; its low degree of tensile strength and its extreme sensitiveness to changes of temperature. It has been often tried, but always given up. Compound wire has sometimes been used and has had some degree of success. It has a steel core, with a copper sheathing, so as to combine strength with conductivity. When the copper is worn off, however, which soon takes place, the conductivity is much diminished.

Light steel wires are more or less coming into use for short telephone lines, where a high degree of conductivity is not necessary; and their advantages are that considerable strength is thereby acquired, that much lighter fixtures may be used, and that householders are much more willing to allow a light wire than a heavy one to be attached to their houses.

Q. 142. What sizes and brands of wire are chiefly employed?

A. For telegraph lines of medium length, for example, one hundred to three hundred miles wire of number 8 or 9 Birmingham gauge is generally employed. The size of No. 8 is .165 of an inch, its weight per mile about 385 pounds and its resistance nearly 13 ohms per mile; while 409 feet measure 1 ohm in resistance.

The size of No. 9 is about .148 of an inch, its weight per mile about 324 pounds, its resistance per mile 16 ohms and one-tenth, and 328 feet of it make a resistance of 1 ohm.

For very long lines—for example, from New York to St. Louis or Chicago—Nos. 4 and 6 are used. The size of No. 4 is .238 of an inch, and of No. 6 .203 of an inch. The weight of No. 4 is about 887 pounds to the mile, and of No. 6 about 570 pounds. The resistance per mile of No. 4 is about  $5\frac{1}{2}$  ohms, that of No. 6 about  $8\frac{1}{2}$  ohms.

For lines but a few miles long—in short, for any line less than 25 miles in length—Nos. 10 and 11 will answer very well, while for very short city lines, employed either as telegraph or telephone wires, Nos. 12 and 14 are as large as necessary.

Their sizes and resistances vary as follows: The size of No. 10 in mils. or thousandths of an inch is .134, No. 11 is .120, No. 12 is .109 and No. 14 is 83.

Their respective weights per mile are 249, 200, 165 and 95 pounds. And their respective resistances  $19\frac{1}{2}$ ,  $24\frac{1}{2}$ ,  $29\frac{1}{2}$  and 51 ohms per mile. These figures are approximately correct. They are necessarily modified, however, in each individual case by the different gauges in use by different manufacturers.

The best brand of wire for telegraphic purposes is undoubtedly charcoal wire. It is now more used in France than anywhere else. "Extra-Best-Best," known commercially by the cabalistic symbols E. B. B., is generally used in this country, and is a first-class quality of wire.

Q. 143. What mechanical tests are usually applied to telegraph wire?

A. Only two tests are generally applied in America to line wire; those for ductility and tensile strength. The first is made by twisting pieces of wire between two vises; the second by direct appliance of weight. Two other tests are desirable and easily applied.

As the value of these tests depends mainly upon the way they are applied, we will describe the four methods somewhat in detail.

The first mechanical test which should be applied is so simple as to be in the hands of every one and is for pliability.

The wire should be capable of being bent four times to a right angle with itself, while held in a vise, without injury.

The second test is to the same end and is equally easy of application. The wire should be capable of being wound around itself a certain number of times without breaking.

The third test is universally employed, both by the Western Union Company in this country and

by the telegraph departments in the principal European countries, and, as previously indicated, if well performed this test is valuable; if performed in a slovenly manner it counts for nothing.

It is to subject a sample of the given wire to twisting and also is a test for ductility. The piece of wire is placed between two vises six inches apart, and twisted; the greater the number of twists that it will bear without splitting or breaking, the better is the ductility of the wire.

The twists are reckoned by the spiral formed by a line drawn along the wire with ink before the test. The number of the twists in wire of the same quality depends upon the size of the wire. For No. 9 it should not fall below 15 twists in the six inches, or for No. 12 below 17. To give the test a proper degree of value, the vise jaws should not have sharp edges, or they will cut the wire and cause it to break close to the vise. The number of twists that any wire should bear varies (roughly) inversely with its diameter. That is, the number of twists that a wire will stand increases in the same proportion as its diameter decreases.

The fourth test is for tensile strength. The wire is required to carry a certain weight or resist a certain strain without breaking.

This test is universal in its application. The requirement of the Western Union Company is that the wire must be capable of elongating 15 per cent. without breaking, and that it must not break under a less strain than two and a half times its own weight per mile.

This test is sometimes made with a hydraulic machine, but oftener with a scale and weights. The last method is much to be preferred, because in the former the additional strain is apt to be too rapidly applied, and the wire, not having time to stretch to the individual strain, will show a greater strength than it has. Using a scale or lever, the weights should be slowly applied and the wire given time to stretch. If the wire to be tested is to be suspended from a hook, it will not do to fasten it with a twist splice, as such a splice will not stand the strain. The wire should be closely wound around the hook and the end brought down parallel to the wire, the two being then closely wrapped with binding wire.

T. D. L.

### Telephone Cables in San Francisco.

Nearly two years ago, after Superintendent Sabin's return from an Eastern tour of inspection, the Pacific Bell Telephone Company commenced using one-inch aerial cables containing 40 No. 20 copper wires, for the purpose of entering their central offices from the roof.

Gradually the length of these cables was extended, and now the main office has seven of them, extending from the tower on the roof of the office to various points. The lengths of cable vary from 100 to 600 feet. This distance was found to be about the limit ordinary cable wires can be used, bound together in one cable, without their interfering with one another from induced currents.

When Mr. Sabin was East this spring, he found San Francisco was far ahead in the use of aerial cables, only one or two large cities using them, and they had only patent anti-induction cables, so heavy and expensively made as almost to make their use prohibitory. San Francisco has 7,500 feet of this 40-wire cable in use, occupying the space of the same number of feet of ordinary wire, but actually representing 57 miles of telephone line, free from all danger of "crosses" and "grounds."

One thousand feet of this cable has just been put in slings on the California street poles. By cutting the cables every 300 feet and cross-connecting the wires, thus changing their relative positions in each section, the trouble from induction has been satisfactorily overcome. Two more sections of 300 feet each are to be added to this cable. The cable used is manufactured by Eugene F. Phillips, of Providence, R. I.—*San Francisco Bulletin*.

The *Detroit Free Press* says: Here was a President of the United States shot. Within a few minutes the fact and all the details of it were known to the remotest corners of the world. Adams and Jefferson died July 4, 1826, and months elapsed before the news reached the confines of the country.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher

NEW YORK, JULY 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE PARIS EXHIBITION.

For the first time in the history of the world the branch of science dealing exclusively with electricity is to have an international exhibition, which will open a fortnight hence, at the Palais l'Industrie, Paris. The French Government has already appropriated 300,000 francs toward this object, and other French parties have guaranteed any possible extra expense, while the generous responses from all civilized nations—particularly America and England—have foreshadowed for it an immense success. The surplus, if any, is to be devoted to scientific purposes. It is proposed to show the practical application and theory of electricity in all its branches, and to bring together the most renowned electricians of the world.

The rapid growth of the telegraph during the past 25 years seems to be too enormous to realize, even now, when we know that half a million miles of wire is employed by the telegraph companies alone; but at this exhibition it is proposed to show in detail its origin, wonderful progress and still more marvelous possibilities, and to prefigure its usefulness in the near future. This, then, will give us a most interesting exhibition—telegraphs, telephones, phonographs, photophones, microphones, electric lights, electric railroads and electric pens—everything in connection with the science that is romantic as well as practicable. In fact, in Paris next month the "Arabian Nights" are to run riot. The visitor will be carried to the exhibition by an elevated electric railway. By day, a whole army of telegraphers and other electricians will be at work. The exhibit of the French Government will include specimens of all its electrical and telegraphic appliances, both for ordinary use and military purposes. The great railroad companies will exhibit their methods of starting and stopping trains by electricity, their electric brakes, and their method of electrically registering the speed of trains, the traction, the force of the wind, the expenditure of steam and so forth. In the nave of the edifice will be a small lake or basin in which will be floating a miniature steamboat laying submarine cables. In an adjoining room the manufacture of these cables will be seen in operation. In a nursery dolls will march about, magic lanterns shine and many playthings move by electricity. According to one French journalist, of more or less veracity, there will be electric chairs that give an electrical reminder to bores who would otherwise never take leave of their hosts, while an ingenious contrivance, which may yet become widely popular, will give a smart electric shock

to peddlers, book agents and tramps generally, if they pull the door-bell a second time.

M. Berger has constructed two salons for telephonic recitations. In one the visitor will be able to drop into an arm-chair and listen to what is being sung at the opera. To the other a wire from the Théâtre Français will convey the accents of Mlle. Croizette and others, while neighboring telephones will enable the visitor to converse with Lyons, Dijon, Orleans and Tours.

By night the scene will be illuminated by thousands of electric lights, in which the Jablochhoff, Jamin, Werdermann, Siemens, Gramme, Lontin, Noaillon, Merteas, Suisse, Wilde, Brush, Swan, Edison, Maxim, Arnaud, Crompton, Brockie and every other system will be represented in friendly competition, some in simple globes and others aided by the reflectors of Ballestrieri's system. These lights will illuminate the exhibition building and vicinity in quite a magical manner until midnight, and above all will tower an immense light-house, lighted with 600 electric lamps fed by one large electromagnetic rotary machine of 850 horse-power.

But the greatest curiosity of all will be a series of rooms in which all the operations of the household will be conducted by electricity, showing what our houses will be when that subtle agency has become an ordinary domestic appliance. The rooms will be illuminated by electric lamps, any one of which can be lighted at will by pressing a button or simply opening the door. In the kitchen steaks will be literally broiled by lightning and coffee warmed by the aurora borealis. The heat for cooking will be furnished by electric currents passing through water; half-a-dozen cooks will prepare waffles à l'électricité; metallic plates warmed by electricity will keep them hot, while an electrical dumbwaiter carries them to the dining-room. Orders to the servants will be transmitted by telephone. In the parlor clocks will run by electricity. In the billiard room the players' count will be accurately recorded by an electric indicator. There will be an electric piano in the music-room and electric hair-brushes in the sleeping chambers. It will be shown, in fact, that the same wire which knits the continents together and makes all nations neighbors can also be used to light, heat and cook, as well as to drive the coffee mill and the sewing machine.

There will be also what is called a retrospective collection of apparatus, concerning the first experiences and oldest applications of electricity, and also a library of works on the science as applied to industry.

It is proper that this great gathering of scientists—the first we hope of many such meetings—should be held on the soil of France. That great country is ever second to none in encouraging the arts and science, and if there be anything which exceeds the renown of her many victories in war it is the steadily increasing glory of her victories in peace. In this La Belle France fitly typifies Electricity itself—that mighty force "which will waft the gentlest whisper or fuse the hardest metal."

America should take especial pride in making a good showing at this exhibition, for in no other country has the development of the telegraph received less aid from the government. Here it is purely an outgrowth of private enterprise, and it is here that, in the past six years, the duplex, quadruplex, telephone and phonograph have been given to the world. We shall hope, with Mr. Walker, that "the country which gave birth to Franklin, to Morse and to Henry, and which is now the home of Gray, of Edison, and of Bell,"

will not be behind hand when the grand record is published.

Some of the French papers having announced that, owing to the unusual quantity of exhibits, the opening of the exhibition would be postponed, M. Berger, the Commissaire General, has authorized the statement that it will certainly be opened on August 1, as before appointed.

WHEN the telephone was invented a cry was at once raised that it would soon supersede the telegraph. One of the good results of this "scare" was that it impelled a good many operators who had been turning their attention to phonography to brush up their knowledge of short hand and begin practicing it. And many who had not taken up the study until the telephone excitement arose addressed themselves to the subject at once. Of these men the writer recalls one who was particularly diligent. He held a position in a railroad office, and worked from early morning until seven at night, but so great was his persistency and effort that he mastered the art of writing phonography in a few months, after sitting up until one and two o'clock to transcribe the notes which he had taken from his wife's dictation. Public business, transmitted by telephone, and taken down in short-hand, has not yet supplanted the telegraph, nor is that change so near at hand that any one need throw away his key and sounder just yet. However, the leased wire idea introduced by the Mutual Union Telegraph Company is opening up a new field for those who combine the qualities of a good operator with those of a fairly expert stenographer. The young man referred to above has already found a lucrative place in one of the leading banking houses, where his services are appreciated as they never were by his telegraphic employers, although he is one of the best operators in the profession. His hours are easy; he is treated like a gentleman, and he has been specifically informed that if he holds out as he has begun there is no position in the house employing him to which he may not reasonably aspire. Compare this inducement to work up to the top of one's bent with the attitude the telegraph companies assume toward their operators, and think of the contrast!

But what we set out to say was this: Operators who are masters of their profession have every incentive at this time to become phonographers. The private line people need their services; journalism needs their services and there are dozens of places outside of the telegraph offices where they can earn good salaries and still have a future before them limited only by their education, intelligence, worth of purpose and reliability. Let them think of this and be fitting themselves for the positions that await them in the future. And we trust that none will make the blunder of attempting a short cut to proficiency by trifling with any of the mongrel order of sign writing. Although it is often a matter of taste, Ben Pitman's is by many considered the best style; Graham's is excellent and Munson's is fairly good. Then there is a system called "Takigraphy," which has many warm friends among its votaries. The others are catch-penny affairs and are never used by stenographers of reputation. The great short-hand experts of this country are Miles, Warburton, Tooley and McEwen of this city, and to them any person who is at all doubtful of the correctness of the above proposition is respectfully referred for information.

There is a large class of first-class telegraphers

in this country who are worthy of something better than "pounding brass," at the same or even lower salaries than they received when they were ten years younger, and it occurs to us that, next to making their advent in journalism—and the profession requires peculiar qualifications not possessed by all—the offices of merchants and bankers who have leased wires offer the best opportunities for them to rise, by diligence, tact and the exercise of faculties which at present certainly do not much more than bring in their bread and butter, as telegraphic corporations are conducted in this era of speculation and open disregard of individual interests.

IN response to the assurance of a prominent Western Union official, published last issue, that, with one or two unimportant exceptions, no reductions had been made in operators' salaries anywhere, we to-day print two communications which show that reductions have been made in several Southern cities.

THE OPERATOR would much rather praise than find fault—in fact, would prefer that there should be no occasion for it to find fault. It, moreover, is inclined to give the General Manager credit for commercial sagacity and a desire to treat the employés at least fairly.

In view of these facts, and of the further one that the Assistant General Manager, whose position ought to make him familiar with such matters, was not aware of these reductions in salaries—for there is no question that his statement was based on his ignorance of reductions having been made—we are led to infer—or, at least, to hope—that much of the credit, or otherwise, for these reductions is due to local superintendents, who expect thereby to create a favorable impression at headquarters. Indeed, we have recently had a case of this nature in the East. A certain superintendent, so the story goes, fearing that his position was not very secure, took it upon himself to cut down the salaries of the employés in his district. Bringing the revised pay-roll to the general manager, he pointed with pride to how "economically" he was in future going to run the district. He was considerably taken aback, however, when his superior instructed him to put the salaries back where they were, and added, somewhat tartly, that when the company desired a reduction in salaries superintendents would be duly informed. It is believed that this superintendent will soon be looking for a position with one of the new companies.

The fact is that *good* operators are extremely scarce, and those who have the permanent interests of the Western Union at heart, will not—and ought not—to encourage a still further thinning out, by this penny-wise, pound-foolish policy of increasing the hours of labor, or decreasing the amount of compensation paid competent and reliable men for conscientious and intelligent work, which we regret to see several superintendents show a disposition to indulge in. We hope, therefore, that General Eckert will stem the tide of dissatisfaction which at present unfortunately exists, by at once giving all his superintendents similar instructions to those he is reported to have given in the instance quoted above.

THE electric light is making excellent progress, both in this country and in Europe. All sorts of predictions were made of its failure. Among others it was too expensive; electric light could never be produced cheaply enough to compete

with gas; while it might be utilized to light large areas, sub-division was an utter impossibility. We find, however, that the electric light has already replaced gas in a large number of mills, factories and public buildings, at home and abroad, and sub-division is so far an accomplished fact that the entire building of the Edison Electric Light Company, on Fifth Avenue, this city, is nightly illuminated in this manner. The factories of the company, moreover, are running to their fullest capacity, turning out lamps, street mains, and other things necessary to supply the demand for the introduction of the light in stores and private houses. The central stations, it is expected, will be ready and street wires run so as to commence the lighting of houses by September, when a war with the gas companies may not unreasonably be expected. Mr. Edison says the company will commence with the same rates as are now charged by the gas companies, although he claims that the electric light can be supplied at a much lower price. If the gas companies reduce the rates, he adds, it will be a splendid advertisement for the light; if they do not, the company will make very large profits. The Brush, United States (Maxim's System) Weston, Standard, New York, and other electric light companies each report that they have all the orders they can fill for many months to come. The above companies will all have extensive exhibits at the electrical exhibition which opens at Paris, August 1. An interesting article on the subject of electric lighting, by Mr. W. H. Preece, will be found in another column.

A COMMITTEE representing employés of the New York City Departments recently called upon the Mayor in reference to an increase of pay. The committee added that the men are often required to work overtime, but that they are not paid for overwork. The Mayor replied that this was all wrong; that overtime should be paid for; that he employs many men in his own private business, and is paying more now than formerly for labor, and that the city ought to pay as much as private employers.

The Western Union, in some of its offices, has inaugurated a system of making the men work extra, when occasion requires it, without any compensation therefor. Just how a company can, with any show of justice or fair play, expect its employés to perform several hours gratuitous labor after their regular duties for the day are over, we confess we cannot understand.

An employer who pays a stipulated sum for nine hours' daily labor, has no more right to demand ten or eleven hours' work in a day, without a corresponding increase in salary, than a customer who pays for a ten-word message has to expect the company to transmit a fifteen or twenty-word one, without charging for the extra words. Of course, an employé should so far study his employer's interest as not to refuse to remain after his regular time when, at rare intervals, an unusual or unexpected increase in business demands it; but even in that case, fairness demands that he be either paid for the extra service or be allowed, at some time, a half holiday to make up for it.

MANAGERS of telegraph companies would find it profitable to look into the question whether increasing the hours of labor, reducing salaries, forcing employés to work after their regular time without extra compensation, repudiating the rules of civil service in appointments, and the like are, in the long run, wise and judicious measures. For instance, does reducing salaries

pay? If the question were one solely of sentiment, if the work would be just as well performed were salaries thirty or forty dollars a month as it would did the company pay eighty or ninety, the matter would be altogether different. But the quality of the services rendered depend almost entirely upon the value put upon them by the company. An important factor in the success of the American Union was that it took advantage of the suicidal efforts of the Western Union to reduce salaries and by paying fair wages for good work was able to enlist under its banner the finest talent in the country. To-day, we find, one after another, our best men resigning to engage in other business; new companies can take their choice from among the Western Union's most valued employés; managers are forced to refuse to accept resignations until they are able to fill the vacant places; and one is led to ask why it is so, or whether such a course is a profitable one in the long run to the companies.

A TELEGRAM from Montreal says that the Board of Trade of that city, on Wednesday, July 13, passed resolutions adverse to the proposition to allow the Montreal Telegraph Company to pass into the control of Jay Gould and the Western Union Company. The proposition of Mr. Gould is that the Dominion Telegraph Company, now leased to the Western Union, and the Montreal company, shall amalgamate and be leased to the Great Northwestern, whose directors shall guarantee the Montreal shareholders eight and the Dominion shareholders six per cent. per annum. The Board of Trade calls upon the government to take such action as will protect the commercial interests of Canada by preventing the telegraph lines of the country being handed over to foreign control. It now looks as though a meeting which was held on Saturday will develop a fierce struggle between the shareholders willing and those unwilling to join fortunes with the Western Union.

A CABLE dispatch from Berlin says that the United German Telegraph Company has entered into an agreement to use the five cables of the Anglo-American Company exclusively, and not those of any other company. Connection will be established with Valentia by wire from Creetseil, East Friesland, passing through the British Channel and around the west coast of Ireland. Telegraphing to America from Germany will consequently be as cheap as from England.

THE new companies, particularly the Mutual Union, are making very encouraging progress, and we soon hope to see a very healthy opposition in the field once more. Col. J. J. S. Wilson, 120 Broadway, New York, is General Superintendent of the Mutual Union. Those of our readers desiring information as to that company can doubtless get it by addressing the Colonel.

Mr. THOMAS BARRACLOUGH, of Manchester, England, advertises in another part of the present issue that he is prepared to furnish complete sets of machinery for the manufacture of telegraph cables. Our readers who wish anything of this kind will find it to their interest to correspond with Mr. Barraclough.

THE OPERATOR is supposed to be a 16-page paper. For several months, however, it has not been smaller than 20 pages, and to-day, for the purpose of "clearing up," we issue a 24-page paper.

### The Telegraphers' Union in the West.

The telegraphers held their regular monthly meeting yesterday afternoon. The principal business transacted was the perfection of their organization and the enrollment of members. Letters were read from similar organizations in other cities, showing that extraordinary progress is being made in perfecting organizations at all the chief telegraph centres in the country. The form of the Union is such that not only are the operators in all the large cities closely bound together, but those at the small stations are included. A wonderful unanimity pervades the craft all over the country, and at some places every operator has been enrolled. The organization in this vicinity is increasing so rapidly, and meeting with such encouragement from ex-operators, that it will soon be the painful exception to be classed among those who are not members.

Although the meeting was held with closed doors, it is given out that the object of the Association is for the mutual benefit of its members, to elevate and promote the interests of the fraternity morally, socially and intellectually. Whether it is to be an organization after the order of Trades' Unions could not be definitely ascertained, but from individual expressions of some of the operators present it is fair to presume that to a certain extent that will be one of the objects of the Association. Old operators that refused to have anything to do with the old "Protective League," which organized the formidable strike in the winter of 1870, are taking active part in the organization of the "Mutual Union."

One operator said yesterday: "It is time that we were doing something. I came into this office ten years ago at a salary of over \$100 per month, and now it is 25 per cent. less than when I commenced, and the work is three times as hard, and the number of hours of work much greater." Another said: "We have work here in Cincinnati for at least twenty regular first-class men, but the company refuse to employ any of the 'subs,' on the regular force, and only pay them for the actual time they work. When they do employ an operator it is always some amateur, and a first-class operator gets left. We will have to sit down on the pupil business if we want to make any headway."

Whether or not the new society is of the protective order, it is certain that the wire-workers are not at all satisfied with their present condition and the policy of their employers.—*Cincinnati Enquirer*, July 11.

### Stored Electricity.

So much unmitigated nonsense has of late been uttered about "secondary batteries," so called, both within and without scientific circles, that one is prompted to summarize an exceedingly interesting and clear letter by Professor Tyndall to the editor of the *London Times*. The letter describes the nature of the secondary battery so lucidly from the first principles that a boy can easily understand it; he disposes of priority claims in an incontrovertible manner, and he deprecates the use of such phrases as "box of electricity" in a way which deserves thanks. Immerse two different metals in an electrolyte and connect them with a galvanometer, and a current is shown to pass by the deflection of the needle of the galvanometer. But if two homogeneous plates of platinum are substituted for the two different metals first placed in the electrolyte the needle of the galvanometer remains stationary. The currents, if any, neutralize each other. Practically there is no current indicated. When, however, the wires connecting these homogeneous plates are detached from the galvanometer and joined—it may be for a moment even—to a voltaic battery the current which immediately passes destroys the homogeneity of the plates, because if the electrolyte be acidulated water, a film of hydrogen will cover one of them and a film of oxygen the other, and the platinum

plates will thus differently coated act just like an ordinary voltaic battery, for a certain time, violently deflecting the galvanometer needle when the wires are connected with the galvanometer. "The experiment may be varied in 50 or 500 different ways, and when, instead of the films of gas, solid layers are deposited electrolytically on one or other of the homogeneous plates, the duration of the current is prolonged. Several cells thus rendered active through the agency of an extraneous current, constitute what is known as a 'secondary battery.'" Ritter, a native of the German village of Liengitz, who died exhausted by restless labor, poverty and disorderly living, was the real inventor of the secondary battery. Planté took up Ritter's labors, and Faure, by aiding the action of the currents of electricity—now so cheaply obtained—through covering Planté's plates of lead with minium, has been able to surpass the power and promise of the Planté lead battery. That is the whole history of the discovery, or, rather invention, which has led some people to suppose it was something like a gasometer, or a means of securing perpetual motion or something of that sort.

### One of the "Cog Hog" Kind.

About two years ago, when an effort was made in the Councils to reduce the pay of the telegraph operators employed at the police stations, a member affirmed that "any man who could open oysters could work one of the police telegraph instruments." For about a month past a number of young men have been under instructions at the Central Station, tutored by the veterans there. The following is a verbatim copy of a message received from a police station and entered upon the reporters' blotter by one of these tyros, who are known as "plugs" among the "regulars":

"About 5 clk this P. m. Bengimin Tomlinson, & Wife was Driving along Butler St. above York Road Hoarses became frighten at Locomotive on Reading R. R. & ran away upsitting completely Demolishing containin farm & Produce serious ingering Mr. Tomlinson & the other slightly they reside in montgomery County."—*Philadelphia Times*.

### An Operator's Dilemma.

To the Editor of The Operator:

SIR: "We have nothing now that we could offer you," was the reply he received. He had worked his way into the telegraph service after a hard struggle, and had for two years devoted the whole of his time faithfully and unceasingly to the company which employed him. During the winter, when snow-storms had so blockaded the road that trains were delayed, his duty required him to be on hand during all hours of the night, there being no night operator, and with the handling of freight, selling tickets, checking baggage, telegraphing and keeping up fires for passengers night and day, with the thermometer below zero, his work was not light.

"Why don't you go and work for some other company?" asked his friend, a train dispatcher from another road who was visiting at——. "Our road will do better for you than this. You have work enough for two men here and will wear yourself out. Operators are in demand now, and there is no occasion for this working night and day on your small salary. I will find a good place for you, if you will come. Our road has quite a number of good places which it finds difficult to fill just now, on account of the scarcity of men in our part of the country. You will be sure to succeed and will not be so over-worked."

Myron A. Leavitt looked at his friend calmly for a moment and replied: "I have a wife and three little ones here; the strictest economy has enabled us to save but little; the expense of moving to some other point would take all we could possibly save for months. My superintendent is very kind, and I prefer to remain, in the hope that he may some day see how things are and make it better for me."

Some weeks later Leavitt received a letter urging him to leave his family and come. "As soon as you become settled you can send for them," it read. "Our superintendent, to whom I spoke of you, promises you [promotion as fast as he can make room for you. You will start at

the same pay as you now receive, but this will not last long, and you will, if you refuse, always regret not having grasped this opportunity." The letter contained much more encouraging advice, and was signed with the familiar name of his dispatcher friend, C. W. Reef.

Leavitt waited a few days, turning the subject over in his mind, and before he had answered the letter he was in receipt of a telegram from Reef's superintendent and another letter from Reef, once more urging him to decide upon going at once.

Who ever heard of an obscure operator being asked to accept of a situation by a superintendent to whom he had never written and with whom he had not the slightest acquaintance?

His mind was now made up. Possibly the unusual attention that had been paid him was flattering to his vanity, and was the means of seducing him from the service of the company for which he had so long labored. Anyway, he accepted the situation offered, and sent his resignation to his superintendent.

"You have been a faithful man, Leavitt," said the chief dispatcher before he took his departure. "We are sorry to lose you, and should you ever wish to return to us, I shall do everything in my power to make room for you."

One month afterward found Leavitt lying sick of a fever at a hotel in a town where he had been sent by his new employers. He had been put on night work as an extra man, and had worked during the last few weeks in four or five little country villages, where the damp air from sloughs, together with a change of water and diet, had at last brought him down, and now he was in receipt of a letter from his wife, who also was sick, asking him to return.

The lapse of another week, under the care of a skilled physician, had enabled him to be up again and he now asked for leave of absence, which was granted and a pass furnished for his return.

Arriving home he called on Mr. H. G. Wayle, the operator who had taken his place. Mr. Wayle at once proceeded to relate his grievances. The work was hard and constant; trains ran at inconvenient hours; arrangement of station was bad; boarding was high. He was often short in his cash from ticket sales; such a jam during train time and so many things to attend to, he could not "make both ends meet" here, besides being overworked. He would go elsewhere, if things continued thus.

A few days later Leavitt saw his old superintendent, to whom he related the condition of his domestic affairs and Mr. Wayle's dissatisfaction in his new position and asked if the latter could not be given something better and himself be reinstated.

"I will do it if it can possibly be arranged. You have done good service for us at——," replied the superintendent.

Mr. Wayle now wrote the superintendent that he would willingly give his place to Mr. Leavitt if extra work were furnished him until a permanent position could be secured. "Operators are scarce on the road now," he suggested, "and there will be places enough."

Mr. Leavitt wrote to his employers not to hold any place for him, as he was about to be reinstated in his old position, where he could better care for his family.

Time passed. In about two weeks Wayle and Leavitt each received a letter from the superintendent. To Wayle he said: "You will be expected to remain where you are." To Leavitt: "We have nothing now that we could offer you."

During his illness Leavitt had spent all the money he had been able to save for two years, and now, with wife and little ones to care for, he works at whatever he can find to do.

"I find it difficult," he says, "to work at anything else, after being so long in railroad business."

He makes no complaint of the superintendent, but we operators who know in what a strait he has been placed know that he has not been fairly dealt with.

How few superintendents think when they hastily write those words how keenly the disappointment is often felt; how many a good and worthy man is often needlessly discouraged, and how, with a bitter pang, he sees the silent tear steal down the cheek of his invalid wife as he reads to her the words: "We have nothing now that we could offer you."

IOWA CITY, Ia., Jan. 30, 1881.

FRATER.

## Chicago Notes.

To the Editor of The Operator:

SIR: Little did any of us think, when we entered the office July 2, that before noon that day news would be flashed over the magic wires from one end of the world to the other, announcing the attempted assassination of the President, and that by a Chicagoan, too. Fortunately for us that day, all our wires were in pretty good working condition, and there being no Board of Trade in session gave us better facilities still for handling business. Every instrument was manned, and the force, from check boy up to the manager, worked like Trojans. The hooks were refilled as fast as they were cleared. Every one looked upon the horrible deed as a great national calamity. Inspired with feelings of patriotism, we forgot for the time being all about our aching heads and throbbing breasts, snatched a bite when opportunity presented itself, and remained at our post of duty from eighteen to twenty hours. Much credit is due the chiefs and assistant chiefs for the prompt manner in which business was handled in their respective divisions. No doubt the company will appreciate such services, but how?

On the 1st a fire broke out in the basement of the A. U. office, threatening at one time to do great damage to the building. Seeing their apparent danger, the instruments and effects of the office were transferred to the W. U. in a few minutes. They are now in the room formerly occupied by the manager. The following comprises the force:

DAY STAFF.—C. Burch (chief); J. Cowdrey, W. H. Borchers, L. W. Marston, C. M. Kinne-man, Col. Harris, R. C. Gray, T. Yearnshaw, B. T. Rowe, Geo. Samuels, Chas. Richardson, Jas. Holligan, Dan. Francis, M. Adams.

NIGHT.—C. Barclay (chief), Geo. Allen, Mr. Tong, F. S. Hogan, cashier and general manager delivery and receiving departments, and about a dozen clerks whose names we were unable to learn.

NEW W. U. ARRIVALS.—Tim Collins, from Buffalo; Geo. Sea, from Wheeling, W. Va.; Cyrus W. Field, L. B. McCargar and C. J. Twohey, the tourist, from Florida.

RESIGNATIONS.—Ed. Shoals, gone to Sioux Falls, Dak.; Jack McGill, Pete Brady and Patsy Kehler, gone to N. Y.; Read, Denver; Warren Baker, St. Paul; Mort. Courtwright, Wheeling, W. Va.; Miss Newton, Lute Smith, Chs. Patch, gone home to Des Moines, Ia., on account of ill health.

D. L. Wilson has charge of the jockey club race-track office this season. Al. Baker has returned from his vacation in Michigan, looking as brown as a berry.

The Brotherhood of Telegraphers is drawing the best operators, most steady and reliable in the office, into its fold. The society, at its last meeting, which was a very enthusiastic one, showed a roll of membership of one hundred and fifty, and something like a hundred dollars in the treasury. This is very encouraging indeed for those who have it in hand.

Two ventilators have been inserted into the roof communicating with the operating room. This is a want long felt. We get some wholesome fresh air now. Superintendent Tubbs is evidently studying the comforts of the operators, and we tender him our hearty thanks through THE OPERATOR for showing so much consideration.

The only way for an operator to get a vacation, in Chicago now is by resigning his position. We had some hopes that the managers here, as well as those elsewhere, would have laid to heart seriously your excellent article in a previous issue, on vacations.

The picture of John Lenhart, in your last issue, was very much admired by his friends in this office. We thought we saw a striking resemblance between it and Dad Armstrong of the W. U., Omaha.

### A Lesson that Should be Learned from the late Reunion.

To the Editor of The Operator:

SIR: There is no denying the fact that those who went with the American Union at the start have been taken care of. Many of them, indeed, have been well taken care of, and there are even a few whose progress and advancement has been

more rapid—perhaps too much so, either for their own ultimate good or with justice to those passed over—than would have been the case had not a forced growth introduced material almost before it had fairly time to sprout. Had the result of the contest been different, however; had the new element not been successful in getting control, it follows, of course, that the people who have become resigned to their fate, after having held on, in many cases, almost for a lifetime, would not have become resigned, but would have still held on. They have gone, though, and others, some well known and some not, have taken their places.

It may be that they who are being thus rapidly pushed ahead are of the right stuff, and again it may turn out that they are not. One thing is pretty certain, at least; and it will be well for all operators to bear it in mind. It is this: The opposition has succeeded in buying out the old established concern, and the opposition has the best of it.

But how often has it turned out this way? How often? Can a single case be recalled? It will be seen from the singularity of the termination that there is necessarily a powerful reason for it. There is. Let the unreflecting meditate, and the unthinking stop and consider. There is not another general manager, with a mighty wide-awake though somewhat forgetful "check mate" at his back, to produce the same results under the same or similar circumstances. The good time has come and gone for the present.

The new aspirants for public favor will be on hand shortly, no doubt, and the usual fine offers and openings will once more cheer and gladden us. When they do come, close both eyes tight and look as far ahead in the gloom as possible. Then don't do anything hastily, but take your time. If you have a position that returns you a steady, though it may be not one of the largest, incomes, with a chance for promotion in the regular order of things, stay where you are. Do not leave. If you do leave and transfer your valuable aid to the new competitor, take the precaution of making a contract in writing for, say, five years from date. You will then be taken care of and may have reason to commend yourself for your forethought and prudence.

Get rich slowly. This is an exceedingly easy task in our business, and you won't experience much difficulty in learning how to do it. If you are young and ambitious, it may come a little hard at first. Be not disheartened if your realizations fall short of your anticipations; that is the common fate of all of us.

Still further bear in mind that when you jump at the deceptive but glittering bait held out to you, another jumps into the vacancy thus created; another jumps in somewhere else, and when this process is continued to any extent it generally happens that a good many of the starters are picked up and dropped down again at the quarter or half-mile pole without having been obliged to labor and learn how to get there. This is bad for them in divers ways, which will readily become apparent with a little scrutiny, and it may prove to be exceedingly disastrous to you, when you manifest a desire to return, and begin to realize that you never did intend to leave there, anyhow.

TOM TANGLE.

NEW YORK, June 21, 1881.

### Salary Reductions in the South.

To the Editor of The Operator:

SIR: In your issue of the 1st inst., I find your reply to a correspondent, giving the authority of a "prominent Western Union official" for the statement that no reductions had been made in operators' salaries anywhere with the exception of a slight change in the case of a clerk in Charleston, etc.

Allow me to correct the statement of the p. W. U. o., by saying that the salaries of the operators in this office were reduced five dollars each per month, from June 1; one thirty-five-dollar clerk discharged, the salary of the cashier and bookkeeper reduced from one hundred to seventy-five per month, and the operating force reduced one man for the summer. The bookkeeper is an operator, twenty-five years in the business, with a large family to support. The rest of us have been at the key from twelve to twenty years, and with increasing years come increasing expenses. If this is not reducing salaries, and with a vengeance, too, what is it?

We are not allowed extra pay, and never claimed any until this late cut in the force. In reply to our respectful petition we were told that it could not be granted under any circumstances. Americans generally have the name of being independent, but the English are ahead of us. Let us copy from them. "TRUTH."

CHARLESTON, S. C., July 6.

To the Editor of The Operator:

SIR: In an editorial in your issue of the 1st instant, you state that in conversation with a prominent W. U. official you were told by him that no reductions in salaries had been made anywhere, except in the case of a clerk in Charleston, and in one or two instances in Philadelphia. On May 15, all the operators receiving ninety dollars, the two chief operators and the manager were notified that their salaries would be reduced five dollars each on and after June 1. This reduction was accordingly carried out last month. Like reductions were made at Atlanta, Charleston, New Orleans, Montgomery and other points.

Out of the ten or twelve operators employed in this office at the time of the reduction, only four were receiving ninety dollars, the remainder receiving from eighty down to fifty dollars. Our force has not been increased since the reduction, nor has our extra pay been discontinued as yet. The force has been increased at Atlanta by the addition of two or three American Union men and the extra pay discontinued. The force in Atlanta was inadequate and an increase was a necessity. The extra pay has also been discontinued at Montgomery and New Orleans, but whether the forces have been increased I do not know.

According to my information, the operators in the offices where the extra has been discontinued are still called upon to do extra work for which, of course, they receive nothing.

As to the extra pay-rolls in a few of the Southern cities being very large, I would state that the business is heavy in the South from about September till May or June, and a great deal of extra work is necessary, as the regular force, working only full time, cannot handle the business promptly. Mr. John M. Crowley, who has been Manager of the Western Union here for the past twelve years, was relieved on June 1 by Mr. W. L. Brenner. Mr. Brenner has been chief clerk for some years in the office of his father, Supt. J. A. Brenner. He has, by the new arrangement, to perform the duties of superintendent, chief clerk, and those of the manager of this office.

FACTS.

AUGUSTA, Ga., July 7.

### Milwaukee Melange.

To the Editor of The Operator:

SIR: The long-looked-for consolidation between the W. U. and N. W. telegraph companies was effected on the 1st instant, and it is seldom that a more disappointed and disgusted lot of telegraphers was ever assembled together than there was on the morning of the first, when the N. W. force learned of the changes that had taken place. The ladies were particularly grieved. Before they had had reasonable hours and an hour and twenty minutes for dinner, with no night or Sunday work. They were, however, at once put on a par with the men in this respect; allotted three hours' work every other Sunday and required to report for duty for two hours two nights during the week, besides being allowed only thirty minutes for dinner. The first two days they spent this slight cessation from duty in all having a good cry. The men talked more independently, and all that was required was a leader in order to have induced the whole force to suspend work until their wrongs were in a measure alleviated. No extra is paid, and men are compelled, on account of the extremely short-handed force, to work from eleven to fifteen hours a day without even a "thank you" from the officers of the company. How long this will last it is doubtful to say, but if resignations continue to be handed in at the rate they have been during the past week, it will not take long to wholly depopulated the Milwaukee office. The manager was forced to refuse to accept several resignations until he could find men to fill their places, which will take several years at the present demand for situations. The following have resigned during the past ten days: Messrs. Davie,

Ander-on, Marlet, Barker, Gifford, Palmer and Brown. The recent additions to the force are Messrs. Houghton, from St. Paul; Worth, from Chicago; Scott and Morris, from the A. & P. Mr. E. M. Shape is day chief over the combined forces, with W. H. Maher as assistant, while Mr. R. T. Fitzgerald, formerly night chief on N. W. side, oversees the combined forces during the still (?) hours of night.

The remarks of your Milwaukee correspondent in your last issue, regarding the questionable mode of procedure taken by a petty chief in venting personal spite on certain operators in this office, are fully borne out by the petty chief's latest actions, before he got relegated. However, as he is now looking for a job, it is better to drop the subject for the present.

OCTOPUS II.

## Cleveland Chronicles.

To the Editor of The Operator:

SIR: On July 6, Mr. George H. Wadsworth, late manager of the American Union office, was appointed chief operator of the Western Union office here, vice Mr. C. F. Stumm, who now takes charge of the night force. Previous to his appointment as manager of the American Union, and for many years, Mr. Wadsworth was assistant chief operator under Mr. Stumm, and gained quite an enviable reputation as a skillful electrician, and some time ago, at the request of friends, he gave a series of lectures on electricity, which were quite popular. So, you see that Mr. Wadsworth is no stranger to us, and as he steps into his new shoes they do not seem to hurt his corns as new shoes are apt to do.

Mr. E. C. Stockwell will work a wire, as will also Mr. W. A. Manning, late night chief W. U. office. Our sympathy is with the unfortunate. There are many stumbling blocks in the path of life, and if, when we stub our toes and fall we can rise feeling stronger and more secure, perhaps our little tumbles will be blessings to us after all. Mr. Geo. A. Leid is in the city, and we understand that his services are to be secured by the new management. George is a finished operator, and what we need is more like him. Mr. C. W. Heaton has recovered from his illness and is again on deck. Mr. L. C. Belding, late manager of the marine office here, has accepted a more desirable position as operator for D. M. Osborne & Co. Mr. A. A. Briggs is working extra when off duty at Wright & Co.'s broker office, as is also Mr. W. C. Ruthenberg. Mr. Oscar M. Sawyer has returned from a ten days' sojourn at Newark, Ohio. Mr. M. E. Dunn, like many others, looks haggard by long and constant labor.

Business is very heavy with us, and many an important message before it reaches its destination is like boarding house steak—very stale. The weather during the past week has been intensely warm, and if it were not for the assurances of the "revised edition," we should suspect that we were verging on—well, I DUNNO.

## The Excitement at Washington.

To the Editor of The Operator:

SIR: We were all taken completely by surprise Saturday morning, having no idea of how much work we had to do before we should get home again. At about 9:30 a. m. some one sent a telegram saying Garfield was dead, and in half an hour dispatches were coming from all over the country asking if the report was true. Manager Whitney had all he could do to answer dispatches of this nature addressed to him. The front office was full of people trying to push their way to the receiving window. It seemed as if everyone wanted to send a telegram to his friends. Operators arrived at 8:30 p. m. from Baltimore to help us out, and were set right to work. We had over 270,000 words of press Saturday night, the highest ever handled in Washington in a single day.

On Tuesday Mr. Whitney received the following dispatch:

MANAGER WHITNEY: The prompt and satisfactory manner in which our employes have met the emergencies of the service during the past few days deserves more than a passing recognition. Disregarding Sunday and holiday hours, they have remained on duty day and night, enabling us to keep the public all over the country constantly advised of the condition of the Presi-

dent. You are authorized to see that they are properly remunerated for the extraordinary service they have so willingly rendered, and to express to them the thanks of the company.

(Signed), THOS. T. ECKERT,  
General Manager.

The delivery and receiving clerks and assistants deserve a great deal of praise for the prompt manner in which they conducted their respective departments. The delivery ran over twenty-five hundred on Saturday, and the received messages even more than that.

WASHINGTON, D. C., July 7.

## Telegraphers' Mutual Union.

To the Editor of The Operator:

SIR: New names are continually being added to the already long membership list of the Telegraphers' Mutual Union. At a meeting of one of the branches last Saturday afternoon twenty-five new members were initiated. Two other branches held meetings this week to initiate new members. In this city there are five branches organized, all of which are in a flourishing condition and accomplishing much good. Two operators have acknowledged that, although they have always received fair salaries they have never had a dollar in a bank until the Union deposited their initiation fee.

Operators, when asked to add their names to the list, respond promptly and willingly, showing that a great deal of interest is taken in it. Two weeks ago the membership list showed 125 in good standing. On the 15th inst. this number will be increased to at least 200. As the Union becomes better known, and its objects understood throughout the city and country, its growth will be more rapid. But up to the present time its success has been most flattering.

Outside cities are sending favorable reports. Chicago, Cincinnati, New Orleans and many other places have organized, and are meeting with success. In most places every man has joined, showing that operators, who heretofore would have nothing to do with organizations, are now coming forward, willing and ready to push forward the good work begun.

NEW YORK, July 13.

T.

## Chicago, St. P., M. &amp; O. Personals.

To the Editor of The Operator:

SIR: Mr. C. E. Hughes, who has for the past thirteen years been connected with the N. W. Tel. Co. as chief operator, is now with this company in same capacity.

Mr. J. T. Collins, formerly with the A. & P., Philadelphia, is now connected with this company in the general office, St. Paul.

Geo. F. Dengler, formerly with the P. W. & B., Philadelphia, is with this road at St. Paul.

L. C. Lamoureux, who has for the past year acted as general office operator, has been promoted to night dispatcher, St. Paul Division, St. Paul.

H. D. McFarland, of Syracuse, N. Y., is at Mankato, Minn.

Messrs. Frank & Ed. McRavey, of Milwaukee, are located at Worthington, Minn.

S. B. Castle, formerly circuit manager at St. James, Minn., can be found in superintendent's office, Sioux City.

W. G. Severance, formerly night operator at St. James, has been appointed circuit manager, and is ever ready to transfer business when necessary.

Rev. D. W. Bailey, formerly manager of N. W. and C., St. P., M. and O. office at Worthington, has been transferred to Sheldon, Ia., as agent and operator.

A. C. Avery, late of the W. U., Chicago, is now at Elroy, Wis., and considered a first-class man and very accommodating. BUD.

"Our station agent has two pupils under his instruction learning telegraphy," says a Long Island paper of —town a thriving and progressive community of about two score inhabitants. The thriving and progressive portion of the population may be readily distinguished when it is added that the office has been established there something less than a year. Let the new telegraph companies take heart, therefore. They will have no difficulty in securing talent, when they have occasion to call for it, and, it might be added, at their own figure, too.

## TELEPHONE DEPARTMENT.

Messrs. Post & Co. may now be said to make a specialty of telephone instruments and supplies in their telegraph department.

Mr. A. G. Day is making a specialty of kerite telephone cables of the Foucault pattern. This Mr. Day recommends as the best cable now known for telephone purposes.

Fort Scott, Kan., has a telephone exchange of 65 subscribers, with good prospects for 100. All the pole lines are built by the Merchants' Telephone and Telegraph Company of Kansas.

The Merchants Tel. & Tel. Co. are building an Exchange in Lawrence, Kansas, with a capacity for one hundred wires and one hundred and fifty subscribers. Sixty subscribers have already been secured. This will connect with Bismarck Grove.

An experiment was tried with the telephone a few days since, whereby Mr. Burns, Superintendent Telegraph Kansas Pacific Railroad, Kansas City, Mo., succeeded in talking very satisfactorily with Brookville, Kan., a distance of 200 miles, with all the way stations cut in.

The Western Telephone Dispatch Co., of St. Joseph, Mo., broke ground June 27, to construct a line between Atchison, Kansas and St. Joseph. It runs via the Hannibal R. R., and is of 25 feet poles, 30 to the mile, one No. 14 steel galvanized wire for four-pin arm—as it is expected business will demand more than one wire—a first-class line in every respect. Mr. Stuart Gwynne, Jr., Manager Atchison exchange, has been appointed Superintendent of Construction.

It takes nerve and patience and good temper to make a good telephone operator, and those who lack any one of these essentials had better let the profession alone. Only one person out of five on the average has a good telephone voice. They speak too low or too loud. Not more than one person out of twenty has the voice which a telephone operator should have—pleasant, even, plain and devoid of peculiarities. Let one of the best operators talk to you over twenty miles of wire and you will fancy that he stands beside you.

Olathe, Kan., a place of 3,000 inhabitants, has an exchange of 25 subscribers in operation, under the management of the Merchants' T. and T. Co. The same company has just completed an independent line between Kansas City and Leavenworth. Supt. Paul Bossart selected a route for this line by which it does not at any point run alongside of any of the various telegraph lines between these cities. The line is entirely isolated from the others, and runs over good roads, and is built with a capacity for five wires—a top pin and four-wire arm.

A new and probably the real cause of the difficulty often experienced in receiving clear transmissions of telephonic messages has been discovered by M. GaiFFE, although it does not altogether seem to account for the phenomena usually ascribed to induction. He cut two equal lengths of rods from the same bar of steel, and having strongly magnetized one of them, introduced both into a telephonic circuit. Both of the rods were then struck in the same way with the following result. The magnetized rod produced great noise in the telephone; the other rod very little. The practical meaning of this is that as iron is the substance usually employed in making the conducting wires of telephones, and is subject, therefore, when moved in the magnetic field of the earth to strong induction currents, copper or some such non-magnetic material should be substituted for iron.

The Elmira Free Press tells of a mother in that city who, bringing her sick baby down stairs for a breath of fresh air, saw her four-year-old girl on a chair in front of the telephone and overheard the following conversation in unmistakably earnest tones: "Hello!" "Well, who is it?" "Is God there?" "Yes." "Is Jesus there?" "Yes." "Tell Jesus I want to speak to him." "Well?" "Is that you, Jesus?" "Yes. What is it?" "Our baby is sick, and we want you to let it get well. Won't you, now?" No answer, and statement and question again repeated, finally answered by a "yes." The little one put the telephone back on its hook, clambered down from her chair, and, with a radiant face, went for her mother, who caught

her in her arms. The baby, whose life had been despaired of, began to mend that day and got well.

Referring to the important decision of Judge Lowell, in the case of the American Bell Telephone Company vs. Albert Spencer and others, reported in last issue of THE OPERATOR, the *Scientific American* says: "Judge Lowell virtually confirms to the American Bell Telephone Company the exclusive right of talking over a wire by electricity. If this decision is correct, then the Telephone Company is in possession of one of the most gigantic and extraordinary monopolies ever obtained by an individual or acquired by a private corporation. It will almost bear comparison with the patent issued by the Spanish sovereigns to Christopher Columbus for his discovery of the New World, by which the continent, its peoples, and their possessions, were placed under his thumb and that of his heirs forever. But the magnitude of that grant caused its ultimate downfall; and possibly the Bellonian patent may, with more justice, meet a similar fate when it reaches the Supreme Court of the United States."

The decision of Judge Lowell in the Spencer case seems to be based on the fifth clause of Bell's claim, patent of Feb. 14, 1876, as follows:

"5. The method of, and apparatus for, transmitting vocal and other sounds, telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air, accompanying the said vocal or other sounds, substantially as set forth."

The Court decides that the specific method of producing the electrical undulations employed by the defendants is different from the Bell plan, the device being made on the principle of the microphone, which has been very much improved since the date of the first Bell patent, but says that "Bell discovered a new art—that of transmitting speech by electricity, and has a right to hold the broadest claim for it which can be permitted in any case—not to abstract right of sending sounds by telegraph without any regard to means, but to all means and processes which he has both invented and claimed."

A correspondent of the *Scientific American* writes: You recently advised to use No. 30 copper wire for acoustic telephone. My experience suggests otherwise, and I submit it. No. 22 is generally sold for this use. On a very short line No. 30 would answer, but on lines of usual length it will break too easily between supports, and too many supports interfere with the transmission of sound. On a line of 3,600 feet I use No. 22, and six supports between the terminal ends; that is, supports are 500 feet apart. The wire has stood for four years, worked well, and no breakage. No. 30 would not do at all. I have tried many varieties of telephone—wood, metal, leather and cloth for diaphragm; steel, iron, and copper wire. No. 22 copper wire, and wood diaphragms, one-sixteenth of an inch thick and three inches diameter, make the best combination. Chamois skin for longest lines makes best diaphragm, but it soon needs replacing. Steel wire produces too much roaring.

In a book on the application of the telephone and microphone to physiological and chemical uses, Dr. Boudet describes his method of automatic recording of telephone messages. To do this he removes the diaphragm of the Bell telephone, screws to the wood one end of a steel spring, the other end being opposite the pole of the magnet. To the free end he solders a small piece of soft iron, weighing one-tenth of a gramme. Attached to this piece, and in the prolongation of the axis of the spring, he fixes a light bamboo arm, ten centimeters long, and terminated by a needle of whalebone. In fact, the diaphragm is replaced by a movable armature resembling the interrupter of an induction coil. The tracings are made on smoked paper, and transferred to glass. There are some points of difference, as well as resemblance, which make it probable that tracings of this kind may be deciphered, but the matter is in embryo yet.—*Scientific American*.

At a meeting of the "Oriental Telephone Co." in London, on the 3d of June, the presiding officer announced that the company was first going to commence its operations in Egypt. It had only been formed four months, and he hoped before two more months were over that the telephones would be established in Cairo and Alex-

andria. The difficulty arose in India from the Indian government being desirous of following the lines which the British post-office had adopted, and as that matter had been for a considerable time under negotiation their position there had been an undefined one. After frequent interviews at the India Office he was glad now to be able to say that the Indian Government had abandoned the idea of interfering with private enterprise in that direction. They had, therefore, now got a clear field, and he believed there was no country in the world in which the telephone ought to be more successful than in India, and he hoped that before the next meeting they would be able to report progress of a very material kind.

W. F. Osborne, of Lake View Farm, Derby Neck, Conn., had a telephone in his house, and the wire was grounded in the most scientific manner to the water pipe over the sink in the kitchen. Last Sunday, June 26, during a thunderstorm the telephone bell kept tinkling with every flash of lightning, to the no small alarm of the ladies in the sitting-room, who finally went into the parlor to escape the electrical demonstration. About 2 o'clock there came a bright flash, a terrific clap of thunder followed within a second of time by a crash in the sitting-room, a smashing of glass in the pantry, and an ejaculation of terror from the kitchen, whence rushed the cook in great alarm. As subsequent investigation seemed to indicate, the bolt had struck the wire somewhere in the orchard, and it had been carried off by the grounded wire. But it was considerably more electricity than could be conveniently transported by a single wire. For a couple of hundred feet through the orchard the wire was melted into pieces of varying lengths, all of which looked as though they had been in a fierce fire. Along the side of the house the paint was scorched off; the copper wire with which the connection had been made with the water-pipe was melted so that only a few tiny bits could be found; the mouth of the brass faucet was likewise melted; the front of the telephone was blown into the middle of the room; the glass of a pantry window underneath which the wire passed was shattered to pieces; and a frying-pan which the cook was wiping near the sink was hurled out of her hand and to the middle of the kitchen floor. Yet nobody was hurt. Mr. Osborne purposes now to have his telephone wire grounded by way of something other than his kitchen water-pipe.

## DASHES HERE AND THERE.

Western Union stock is quoted at 91%. Last issue it was 135.

The German coal mines have commenced conveying coal to the pit's mouth by electric railways.

Telegraph and telephone men will find the Waters tree pruner, advertised on our outside page, extremely valuable for trimming limbs of trees near their wires.

The Blanchard Manufacturing Company, in addition to their branch store at 28 Scholl street, Boston, have just opened another retail store at No. 8 Tremont street, same city.

On Sunday evening last at a service of thanksgiving for the recovery of President Garfield, Rev. Mr. Pegg, of Brooklyn, N. Y., said: I thank God for the telegraph. We all should thank him for this great blessing. What terrible suspense has been saved us; what loving sympathies have poured in from all the world!

A paper on electricity and the announcement of fire, lately read by M. Bartelons before the scientific section of the Syndical Union of Belgium, stated, on statistical evidence, that with the most perfected systems serious fires were reduced to 4 per cent.; with systems of telegraph lines, but without alarms, they still reached 17 per cent., while without telegraphic assistance they reached 27 per cent.

A telegram dated Marshalltown, Iowa, July 11, reports a severe storm which did much damage to property in that vicinity. It also says that Manager Ward, of the Western Union, started east on a handcar and rafts to repair the telegraph lines, and succeeded in getting only five miles. He found many telegraph poles shivered

by lightning and the Timber Creek Bridge on the Northwestern road swept away. The creek there is a mile wide, and the Iowa River (below) three miles wide.

In the year 1880 there were in the United States 170,103 miles of telegraphic line, and during that year 33,155,991 messages were sent. The miles of wire were about 300,000. This does not include the lines used exclusively for railroad business. The other countries having the greatest length of lines are as follows: Russia, 56,170 miles; Germany, 41,431; France, 36,970; Austria-Hungary, 30,403; Australia, 26,842; Great Britain, 23,156; British India, 18,209; Turkey, 17,085; and Italy, 15,864.

Lovers of outdoor sports will be interested in the announcement of a new feature in horse-racing which is to be introduced by the new Louisiana Jockey Club at their spring meeting in April. Some of the races are to be run at night, the course being illuminated by electric lamps, forty of which are to be provided for that purpose. It is claimed that this plan will be of great value at turf meetings during the summer, as it will give the horses, as well as the jockeys and spectators, the benefit of the cool air of the evening.

Additional machinery is now used in illuminating Niagara Falls by the electric light. On the evening of July 6 the first exhibition of the new improvement was given, with a strangely grand effect. The light now is strong enough to reach the Horseshoe Falls and penetrate the huge clouds of spray. The American Falls are reached at every point and form a beautiful view. New reflectors have been placed in such a position as to throw strong rays of light on the rapids, just above the Falls, which resemble a huge sheet of quicksilver, the whole forming a magnificent illumination.

One of the uses that the electric light may possibly be put to is that of lighting railroad tracks in such a manner as to do away with headlights. At least the feasibility of using the light for such a purpose has been suggested to railroad men, the idea being to utilize the existing telegraph poles as supports for electric lights which should make a continuous illumination along the entire road. Should it seem practicable after careful investigation and tests are made, the additional security from accidents and the convenience of the plan would doubtless bring it into prompt and careful consideration.—*American Railway Journal*.

Mr. George Cumming, of the W. U. main office night force, this city, has invented a new telegraph key, which will be put upon the market by Messrs. L. G. Tillotson & Co. It will be known as the Cumming periphery-contact key, and the advantages claimed for it are that it cannot be made to "stick" and that its use will not tend to cause telegraphers' paralysis. The novel feature of the key consists of two wheels or discs swinging one upon the other at right angles, one in the curve of the lever and the other immediately below it in the insulated standard. Contact is made on the rims of these platina discs, instead of the two wire points in general use. Those who have practically tested the key speak very highly of it.

A Canadian correspondent, referring to the complaint from Chicago published last issue, that dissatisfaction exists among the night staff there on account of having to wait from four to six hours for their pay on the first of every month, asks what the Chicagoans would say if, instead of from four to six hours, they had to wait four, six, eight and ten days before receiving their pay? "This, nevertheless," he adds, "is the monthly experience of the employees in one of the principal Canadian offices, and yet they don't complain—perish the thought! Some people don't know when they are well off."

Mr. Morton Wright claims to have discovered a new and wonderful source of electrical supply. He has studied the natural process by which heat is absorbed and transmuted in the electric eel and torpedo fish—the electro-motive force of which is so great that it makes a perceptible deflection of the galvanometer through a resistance of 500,000 ohms—and claims that he can now produce, by a similar process, a powerful and constant current, requiring only moderate warmth to keep it uniform. This would obviate

the necessity for furnace, steam boiler, steam engine and dynamo-machine in electric lighting; and, if Mr. Wright's story holds good, it will prove to be a valuable discovery.

It is said that the directors of the Brush Company have found by experience that the absolute continuity of their light cannot be relied on, and that for some cause or other it is liable to cease suddenly. To guard against this disaster, the directors of the Brush Company communicated, it is said, with the Board of the Gas Company, and an arrangement was finally made that the Gas Company should keep up a full staff of men at all the points served by the Brush Company, and a full supply of gas at the mains ready to light up at any moment that the electricity might fail, all the expense of the staff and the reserved gas to be borne, of course, by the Brush Company.

The largest number of words sent from Washington to the newspapers of the country in any one day previous to the attempted assassination of President Garfield was on the last inauguration day, when the high-water mark was 190,000 words. Previous to that the largest number of words was on one day during the Credit Mobilier excitement, in 1873, when 113,000 words were transmitted. On Saturday, the 2d, the Washington office sent 275,000 words, on Sunday nearly as many, and on Monday 213,000 words. The number of words in the average newspaper column is 2,000, and on Sunday morning, therefore, the total amount of press dispatches filled at least 140 columns of the daily newspapers, no allowance being made for duplication in space by dropping the same matter for newspapers in different cities.

Mr. Huntington, through a writer in the *Art Review*, relates that when he was painting his "Men of Science," the late Professor Henry and Professor Morse were in a state of disagreement, growing out of rivalry concerning the discovery of the electric telegraph. So bitter were the feelings of Professor Henry against his more successful competitor, who, as he alleged, had lied about him and traduced him, that he emphatically objected to being included in the painting if Morse was also to appear in it. When he at last yielded to the earnest appeal of the artist, he said, "Then as far from Morse as possible." While he was sitting for his portrait for this purpose his sentiments on the subject were so violent that he would spring from his chair, and, pacing the floor with intense passion, hurl invectives against the man who had robbed him of the honors which he thought were justly his own.

Electricity has been put to many uses, and one of the most ingenious applications of it is to the middlings purifiers in place of the air blast. Frictional electricity is employed, the middlings passing under hard rubber rollers electrified by friction against a sheepskin cushion. The bran is attracted to the roller, and is swept off by brushes, the middlings passing through the bolts in the order of their fineness. The machine, which has been in practical use at a large mill for a year past, is said to be economical of power, and works without the dust and waste involved in any process of purification by air. It is quite within the range of probability that some day great flouring mills will have their machinery run by electrical engines, converting the power of water wheels at a distance, be lighted by electric lamps, and have their middlings purified by another kind of electricity.

The English government has employed women as telegraphists since January, 1870. Nominations to compete are given by the Postmaster General. The limits of age are "not under fourteen or over eighteen." They receive eight shillings a week to begin with, the highest scale of pay being thirty shillings a week, and they work eight hours a day, between the hours of eight A. M. and eight P. M. They formerly worked in separate galleries, but it was found desirable to place them in the same galleries as the men and boys, and the society and mutual influence has been productive of beneficial results. It is deemed inexpedient to employ females in night work. At the present time 968 women telegraphists are employed by government in London, Edinburgh and Dublin.

M. Leon Manet has devised a process for bleaching blood albumen by means of the electric light. The albumen is taken after separation,

and either before or after drying. It is then exposed to the light. The inventor arranged electric lights fitted with lenses or reflectors, so as to cast their light upon the albumen which is to be bleached. If it is still liquid the light is thrown upon the plates or trays which contain it in the drying stove. These plates may be made of glass, so as to let the rays pass through them. If the albumen is dry the light can be thrown upon layers of the article arranged upon the stage. In either case the process varies in duration, according as the albumen has been more or less completely separated from the clot. Under ordinary circumstances twenty-four hours will suffice to bring about a perfect decoloration.

The apparatus proposed for telegraphic photography by Messrs. Ayrton and Perry is thus described in the English journals: There is a "mosaic" of selenium cells, each cell in telegraphic communication with one of a corresponding number of devices, by which a small mirror is adjusted to throw more or less light on a screen. They thus hope to produce a pattern in light and shade corresponding with the amount of light and shade thrown on the selenium cells by a picture thrown upon them from a magic lantern, just as a photograph represents in light and shade the object from which it is taken. In practice they hope to use only a few cells, moving rapidly over the field of view, and also to limit the number of wires which would be required if each cell had a separate circuit. Further, they are trying to avail themselves of the properties of the Japanese "magic mirror," by using a metal plate and a system of magnets behind it.

The following unique application for employment was recently received by a prominent manager: "The devoted subscriber, telegraph operator Michael Friedrich Koestler, from München, Germany, permits himself to address to you the following petition: As I was active as telegraph assistant in München, etc., five years, and how the added testimony of the General Telegraph Direction in München confirms the ordered telegraphy knowledge in every point possesses, I petition you to have the favor to confer me any place as telegraph operator in the country. I am twenty-seven years old, married, studied in Germany till my nineteenth year, also the English language some years, and I am convinced to acquire the fullest satisfaction of my superiors. I have been here seven months. I exercised the American system, and I am versed in Morse, railroad office, etc. As I ask to regard my petition as soon as possible, I permit myself to request your resolution to send to my added address."

Now that Gen. Loris Melikoff has made the discovery of the most effective means of torturing the Czar's assassins, it is quite likely that the knout, the rack, the boot and the thumbscrew will be abandoned in favor of electricity. The principal factors of this new idea are said to be fictitious sensory phenomena—horrible red lights and phantom figures; sounds, compared with which the shriek of hysteria is mellow; tastes that are terrible beyond description, and odors that are intolerable. These are soon succeeded, or rather accompanied, by neuralgic torments that are as maddening as they are indescribable, but disappear almost instantaneously on withdrawal of the electrodes, leaving the victim exhausted, but comparatively uninjured, yet so completely broken down by the nervous shock that the sight of a battery forever recalls terrors that set the poor victim trembling with apprehension. Experiments in this field have been tried on a small scale by daring experimentalists, who pronounce the phenomena maddening beyond conception.

Mr. Shelford Bidwell has explained the process for transmitting pictures of natural objects by telegraph which he has applied in his telephotograph. The positive pole of a battery is connected through a set of resistance coils to a piece of platinum wire, and the negative pole to a plate of zinc, upon which is placed a sheet of paper moistened with a solution of potassium iodide. The negative pole of a second battery is connected through a selenium cell with the same platinum wire, and the positive pole to the zinc plate. The point of the platinum wire is pressed upon the paper, and the selenium being exposed to a strong light the variable resistance is so ad-

justed that the currents from the two batteries which pass through the paper in opposite directions, exactly neutralize each other. The platinum point will now make no mark when drawn over the paper, but if the selenium is shaded its resistance is immediately increased. The current from the first battery then predominates, and the path of the platinum point across the paper is marked by a brown line due to the liberation of iodine. Designs cut out of tin-foil and projected by a line have been successfully transmitted.

The *London Telegraph*, in noticing a book upon Albania, quotes a funny story, which shows how electrical science is gradually creeping into the darkest nooks of the earth. Although the discovery was made over a century ago, a high official of Scutari heard only in 1874, as something brand new, that a certain Giaour named Ben. Franklin had invented an instrument by the judicious use of which lightning strokes might be rendered harmless to human life and property. Forthwith he resolved to become possessed of one of these wonder-working contrivances; but, in putting it up he erected only the superficial part of a lightning rod, omitting the ground connections altogether. Worse still, he selected the powder magazine of his castle for the experiment, that being the most desirable place to protect from lightning. The result surpassed his wildest expectations. A fiery streak darted from the sky followed by a tremendous concussion, and when the smoke cleared off it was the Pasha's melancholy privilege to behold his beloved citadel in ruins. His Excellency now says this boasted Western civilization is a sham.

Mr. Warrington Smyth, Prof. Tyndall, Prof. Abel and others, acting in the capacity of Royal Commissioners, lately spent two days in examining and testing in various ways the utility of the electric light in the Pleasley colliery, near Mansfield, England. At the conclusion of the experiments they spoke in high terms of the results, and they will, no doubt, submit a very favorable official report. Of course, the incandescent lamp was used, but it was covered by a lantern filled with ordinary atmospheric air for the double purpose of protecting the inclosed glass bulb, when carried about, and of insuring the instantaneous combustion of the carbon filament if any fracture of the bulb occurred. The pits are 1,600 feet deep, with extensive workings. The experiments were, in this case, confined to three workings, about a third of a mile from the bottom of the pits, and about 94 lamps in all were employed. At the top of the upcast shaft the electricity was generated by an ordinary Gramme machine driven by a portable engine. From the generator the electricity passed along wires to cables at the bottom of the pit, and these cables conducted it to the main level, where it seems to have been divided by branch cables leading through side passages or gates to the places where the coal was excavated. Then by means of insulated wires the electricity was led to the lamps which gave light to the miners, who seem to have been well pleased with the illumination produced, in any position or place, without any attention on their part. The particular system used was that of Swan, which is much the same as Edison's or Maxim's.

The following circular was recently sent to and signed by all the operators and agents on the Grand Trunk Railway. For some unexplained reason, however, it was not presented to the General Manager, and now languishes in some waste-basket:

We, the undersigned telegraph operators and agents connected with the Telegraph Department of the Grand Trunk Railway, beg to present, through you, our petition to the General Manager, praying for an increase of salary, viz.: For those who have been in the service under two years, to receive an advance of ten per cent.; those from two to four years, fifteen per cent.; and all over four years, twenty per cent. on their rates of pay, viz.: Those now rated at \$1.15 to receive ten per cent., until they have served two years from date of entry, which would make the pay \$1.26; at the expiration of the first two years, to receive an additional advance of five per cent., making the pay \$1.32; and after serving four years, to receive a further advance of five per cent., making the pay \$1.38; and operators over four years to have the advantage of being still further advanced by being

promoted to stations rated higher at the present time. And we also pray that these three be the standing grades of pay, and that the existing classifications of the stations be maintained. The extra amount of work that is now being done on the road necessitates extra care, diligence and promptitude, and greatly increases our responsibilities and duties in connection with that department. That the cost of living has of late years become so enhanced that it is almost impossible to exist on the very small salary we receive. That it is also very discouraging to find almost every class of workmen holding much less responsible positions receiving much better remuneration than we are.

## NEW YORK CITY ITEMS.

### Echoes from 195.

Mr. Fred. W. Cushing, of 195, sailed on Saturday last for Europe, to take charge of the exhibit of the harmonic system at the Paris Electrical Exhibition. Professor Elisha Gray and Professor H. S. Carhart, accompanied by their wives, sailed on the same steamer.

During the past year there has been an average attendance of three outsiders learning telegraphy in the Western Union main office. Two of the students have just been given situations on the Long Island wires, but probably there will be no diminution of the number of students in the future.

Visitors to the operating room when the office was first opened were led to wonder at the unsightly screen that barricaded the ladies' or city line department from the general operating department. At that time the presence of a masculine operator within the sacred precinct was an event of more importance and consternation than the intrusion of a mouse would have been. The first innovation was the removal of the screen, but woe betide the absent minded individual who allowed his optics to feast upon the visions of female loveliness that patted a key within the still sacred department. Suspension was the penalty for staring. A year or two later the increased business and lack of female talent necessitated the transfer of gentlemen operators to the ladies' department for emergencies. Those transferred were selected for their apparent youthfulness and freedom from guile. Within the past year the ladies' dinner reliefs have been mostly male operators. Very recently a perfect innovation has taken place, and the smiling faces of gentlemen operators may be seen beaming in every part of the city line at all times, and very little restraint is placed upon them, as far as outsiders can observe. The free indulgence in conversation is made apparent by the smiles which light up their countenances, indicating pleasant enjoyment amid the cares of duty.

### Other City Items.

Mr. John Dalton, train dispatcher for the Harlem Railroad ever since the occupancy of the Grand Central Depot, has been promoted to be train dispatcher for the New York Central & Hudson River and New York & Harlem roads jointly.

A well-known firm of bookmakers up town were swindled out of about \$3,000 last week by some one who telegraphed them the wrong result of the race for the Shrewsbury Handicap. The wires had been tampered with and Krupp Gun was announced as the winner instead of Ripple.

Evidently, Charles Dickens had the American Rapid system in his mind's eye when he wrote the following conversation between Mr. and Mrs. Mantalini: "You nasty, idle, good for nothing brute," cried the woman, stamping on the ground, "why don't you turn the mangle?" "So I am, my life and soul!" replied a man's voice. "I am always turning, I am perpetually turning, like an old horse in a mill. My life is one horrid grind!"

Mr. George E. Baker has resigned his position as chief operator American Union Telegraph Company, 135 Broadway, to accept one as Superintendent of Circuits for the Mutual Union Company. On the evening of July 1 Mr. Baker was waited upon by a committee from the American Union office and presented with a handsome

gold watch, with following inscription: "Presented to George E. Baker, Chief Operator, as a token of esteem, by his friends and associates of the American Union Telegraph Company, July 1, 1881."

Scene in city line office five minutes after closing time:

Clerk—"Shall I send it paid or collect?"

Customer—"Hey?"

Clerk (raising his voice)—"Shall I send it paid or collect?"

Customer—"What?"

Clerk—"Shall I send it paid or collect?"

Customer (almost in a whisper)—"Send it right away." (TABLEAU.)

Mr. H. Robson, at present manager of the French Cable Company's New York office, sails on the steamer Nevada, Aug. 2, to take charge of the London office of the new American Cable Company. Mr. D. Le Rougetel, clerk in charge, and Mr. Joseph Ball, operator, same office, sail for England at an early day, the former to assume the management of the Liverpool office and the latter to be operator in the London office of the new American Company. These gentlemen's successors have not yet been appointed.

The Mutual District Messenger Company (limited) opened its first district office Jan. 17, 1881. Since that time they have opened nine large district offices. During the summer these districts will be filled with instruments preparatory to the spreading of the system and opening of district offices elsewhere about the city. The demand for this company's service is beyond the most sanguine expectations, and only shows how well the public support a properly conducted institution. It is proposed to introduce many new features in the messenger business as soon as opportunity offers. The company is collecting and turning over to the various telegraph companies 6,000 telegrams per month.

## PERSONAL.

Mr. J. B. Hobbs, of Greensburg, Ky., has been transferred to New Hope, Ky.

Mr. F. Michinard, Vermillion, La., will receive subscriptions for THE OPERATOR in his vicinity.

Mr. J. T. Burgess, of North Sydney, C. B., has been ordered to Canso, the terminus of Mr. Gould's new cable.

Mr. W. Irwin, formerly of Renova, Pa., is now Superintendent La. Western R.R., at Vermillion, La. Mr. W. E. Jessup is agent at same place.

Mr. R. G. W. Denison, referred to in this column last issue, is now with the Mutual Union in this city.

Mr. Geo. Warren, a well known operator, has returned to this city from Denver, Col., but is going into the newspaper business in Michigan.

The Dominion office at Sydney, N. S., having been closed, Mr. J. C. Le Cras is now operator and clerk in the H. & C. B. Ry. office at Antigonish.

Charles H. Mixer, late a chief operator in the Western Union office at Chicago, has been appointed an examiner in the Patent office at Washington.

William J. Curtis, late of the Western Union, at New York, has resigned his position and is at present "subbing" in the Washington office of the New York Associated Press.

Mr. C. H. Smith, agent and commercial operator at Spuyten Duyvil, N. Y., for the past ten years, has resigned and accepted a more lucrative position as U. S. Mail Messenger. Wm. Fitzgerald, late of Morris Dock, is his successor.

Mr. Frank T. Ecker, of the General Office C., St. P., M. & O. Line, St. Paul, Minn., is the authorized agent in his vicinity for THE OPERATOR and for the books we publish. Subscriptions and orders can be addressed to him as above.

The headquarters for the United States Military Telegraph lines in Texas and Indian Territory have been removed from Denison to San Antonio, Texas, with Lieut. L. E. Seabee, signal corps, in command, vice Lieut. Tingle, 2d Artillery.

Mr. F. R. Phillips, late of North Sydney cable office, is now working at 195. Mr. P. was the recipient of a farewell dinner from his friends at

North Sydney. Mr. J. T. Burgess, late of 195, is subbing at North Sydney, where his many friends are pleased to see him again.

Lieut. Chas. A. Tingle having been transferred from the superintendence of the Texas Division U. S. M. T. line, was, on July 4, presented by the operators of the division with a massive gold watch, chain and charm, suitably inscribed. The presentation speech was made by Chief Operator W. T. Blythe.

W. T. Loper, formerly Senate reporter for the Associated Press at Washington, but more recently telegrapher and stenographer in the office of George William Ballou & Co., New York, has been appointed agent of the New York Associated Press at Chicago.

Among recent Western Union changes are the following: At Cincinnati, Mr. G. T. Williams has been succeeded by Mr. I. N. Miller; at Omaha, W. B. Hibbard was succeeded by J. J. Dickey, son of Judge T. Lyle Dickey, of the Illinois Supreme Court; at Chicago, Col. J. J. S. Wilson is succeeded by F. H. Tubbs.

Among the well-known telegraphers who have gone over to the Mutual Union are Col. J. J. S. Wilson, of Chicago; Electrician Hadden and Chief Operator Baker, late of the A. U. (both of whom have contracts for three years), Superintendent Williams and Manager Armstrong, of Cincinnati; Manager Allen, of Utica; Manager Parsons, of Batavia, N. Y.

A correspondent from North Sydney sends us the following: "That the General Manager is very popular in this region is evidenced by Mr. C. W. Hurlburt, of the cable staff, launching a pretty little yacht and calling her the General Eckert. Probably Mr. H. expects a donation to the W. U. Boat Club, which consists of four yachts, five rowing boats and a racing shell."

John A. Hutchison, night chief of the American Union Office in Washington resigned his position on the 10th instant, and has accepted a situation with Henry D. Cooke, Jr. & Co., as telegraph operator and stenographer. Cooke & Co. lease a Mutual Union wire, and their business has greatly increased since the wire was introduced.

Mr. H. A. Clute, of Harrisburg, Pa., whose resignation as assistant superintendent took effect June 30, was on that afternoon, as an evidence of the esteem in which the operators of the district held him, presented with a magnificent set of silverware, consisting of a coffee urn, coffee pot, tea pot, slop or water bowl, cream pitcher, sugar bowl and spoonholder. The presentation remarks were made by Mr. Richard Zeigler in behalf of the attachés, Mr. Clute replying in a very feeling manner.

Twenty-five years ago Mr. William B. Sfrong, now General Manager of the Atchison, Topeka & Santa Fé Railroad, was beginning to learn telegraphing. Since then his successive steps from telegraph operator have been: Station Agent; General Agent at Council Bluffs and Omaha, on the Northwestern; Division Superintendent and Assistant General Superintendent of the Chicago, Burlington & Quincy; General Superintendent of the Michigan Central and then of the Chicago, Burlington & Quincy, going thence to the Atchison, Topeka & Santa Fé.

The funeral of Mr. J. D. Sampson, Assistant Telegraph Superintendent Erie Railway, took place at Paterson, N. J., June 28, and was largely attended by operators from each of the six divisions of the Erie. The following operators acted as pall-bearers: Mr. Powers, of New York, who taught Mr. Sampson the art of telegraphy; Messrs. M. Brick, of New York; N. Walsh, of Susquehanna; N. Parmley, of Owego, and J. C. Dunning, of Paterson. The floral decorations were very numerous and exceedingly handsome, between \$300 and \$400 having been expended for flowers, to show the esteem in which Mr. Sampson was held by his co-laborers and subordinates.

Since the income of Mr. Charles Brush, one of the inventors of the electric light, has grown to be \$1,000 per day, the usual newspaper paragraph has started on its rounds to the effect that he could not borrow \$5 at one period in his life. That statement should be set at rest, however, by "J. A. B.," who writes: "Mr. Brush is the son of Colonel Brush, a farmer in independent circumstances in Euclid, near Cleveland,

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY.

BEST IN THE  
WORLD.

PATENTED Feb. 15  
1881.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for-rapid and perfect sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert, or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of U. S. or Canada on receipt of the above price, by registered letter or money order.

## THE AMERICAN UNION TELEGRAPH CO.

New York, Dec. 18th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—We have in use in this office, sixty-eight of your Steel Lever Keys.

The general verdict regarding them is, that **THEY ARE THE BEST KEYS EVER PUT ON A DESK.**

Yours truly,

WM. J. DEALY,  
Manager Am. Union Co.'s (Main Office).

## UNION PACIFIC RAILWAY CO. (Telegraph Dep't).

Omaha, Neb., January 15th, 1881.

J. H. BUNNELL & Co.

Dear Sirs:—Your instruments meet with much favor on this company's lines and give good satisfaction. The Steel Lever Keys, especially, are much admired by the operators who generally pronounce them *the best*. They at once combine strength and neatness, and are well adapted for easy and rapid sending.

Yours truly,

L. H. KORTY,

Chief Operator.

## CONTINENTAL TELEGRAPH CO.

New York, Dec. 14th, 1880.

J. H. BUNNELL & Co.

There is nothing that I can say that will be too strong in commendation of your New Steel Lever Key. Every one of our operators, without exception, regard it with decided favor, and I am now satisfied that its general use is not only a positive help to operators' efficient labors, but a decided advantage to the general service of the Company. We are using them in preference to all others. Yours truly,

J. G. CASE,

City Manager Continental Tel. Co.

## THE ATLANTIC AND PACIFIC TELEGRAPH CO.

New York, Dec. 16th, 1880.

J. H. BUNNELL & Co.

We have six of your Patent Steel Lever Keys in use here in principal office of this Company. They give entire satisfaction in every way. We consider them a great improvement on the old style of telegraph key.

Yours truly,

P. P. HAUFF,

Manager Main Office, 145 Broadway, N. Y.

## BALTIMORE AND OHIO RAILROAD CO. (Tel. Dep't),

Baltimore, Dec. 28th, 1880.

J. H. BUNNELL & Co.

Gentlemen:—I take pleasure in forwarding to you the accompanying testimonial, voluntarily contributed by the operators in Camden Station Office, to the superior merits of your New Steel Lever Key.

Very truly yours,

CHAS. A. TINKER, Supt.

## BALTIMORE AND OHIO RAILROAD COMPANY.

(Telegraph Department.)

December 27, 1880.

We, the undersigned operators at Camden Station, B. and O. R. R., Baltimore, having fully tested your "New Steel Lever Key," concur in saying, it is the *best*, without any exception, we have ever used.

Respectfully,

CHAS. P. ADAMS,

GEO. R. BUNTING, JR.

E. J. LITTLE,

W. E. KING,

J. W. FERRY,

B. F. HARD,

A. D. FEASEL,

GEORGE BOGGS,

W. W. MOORE,

WM. A. LENZ,

J. F. McLAUGHLIN,

J. W. STAYLOR,

H. P. BILSON.

And I endorse the above, C. W. CLARVOE, Div. Operator.

From the winner of first prize in the fast sending tournament, New York, August 22, 1880, 500 words in 11 min. 14½ seconds.

"Cable Station No. Sydney, C. B." Dec. 26, 1880.

Prefer it to any other key I have ever used. It is the general opinion of the operators here that the Steel Lever Key is the best they have ever seen.

W. J. CURTIS.

"Your Steel Lever Key proves to be one of the best improvements ever introduced in Telegraphic Apparatus."

J. H. LOUNSBURY,

Manager Am. Union Telegraph, Hartford, Conn.

All our best senders who have tried it here, praise it highly and pronounce it "fast."

R. J. WYNNE,

W. U. Telegraph, Washington, D. C.

THE FOLLOWING EXPRESSIONS OF OPINION ARE ALL FROM THE WESTERN UNION MAIN OFFICE, 197 BROADWAY, NEW YORK.

We have your keys on the Chicago, St. Louis and Buffalo Quads, Western, Eastern and State Press, and C. N. D. Circuits. Without a single exception, the operators regard them as the very best.

FRED CATLIN.

Best key I ever used.

FRANK VITES.

Having worked your Key on Chicago Quad for the past month, can cheerfully say it is the best Telegraph Key I have ever used.

CHAS. F. HUTCHINSON.

Far superior to any other Key.

COURT M. CUNNINGHAM.

Requires less labor, is capable of greater speed, and sends finer and firmer Morse than any heretofore in use.

J. A. WRIGHT, JR.,

D. B. CASE,

RICHMOND SMITH,

E. F. HOWELL.

Consider your Key far superior to any I have yet handled.

J. E. SAYRES,

Cincinnati Quad.

Like the Key very much. It makes sending easy.

T. H. ALLEN,

New Orleans Duplex.

Your Key is, without doubt, the best in the world. It is simply perfection.

J. B. COULTER.

Our only desire is to have one of your Keys put on the Pittsburg Quad. Eitymiller works on the Pittsburg end.

DENNIS BROWN and M. DURIVAN.

Your Key is, in my opinion, unequalled.

MINOR M. DAVIS,

Philadelphia Quad.

The finest in the world.

J. B. TALTAVAL, J. H. YOUNG,

St. Louis Quad.

Best I have ever used.

E. H. MILLER,

State Press.

Prefer it to any I have ever used.

CHAS. W. MINIER.

The best Telegraph Key we ever handled.

W. D. CHANDLER,

M. LABAUGH,

Chicago Quad.

There is but one perfect Key, and this is it.

W. O. ATKINSON,

Baltimore Quad.

## THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

### PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager.  
FRANK SHAW, Engineer.

### THE FIRST AND ONLY TELEGRAPHIC NOVEL! "WIRED LOVE," A ROMANCE OF DOTS AND DASHES.

BY  
ELLA CHEEVER THAYER.

"The old, old story" in a new, new way.  
TWO HUNDRED AND FIFTY-SIX PAGES  
Handsomely bound in cloth. Price, 75 cents.

This brilliant little story should be read by every member of the telegraphic fraternity. Cupid "on the wire," although he meets with "breaks" and "crosses," is not dismayed, and refuses to be "switched off." The different features of an operator's daily life are ably set forth, and, aside from the novelty of the plot, the book is written in an easy, humorous style. The chapter on "The Feast," and the mishaps and adventures of Poor Quimby, will cause the heartiest laughter.

Get the book by all means, and you will wish to "G. A." without a break until the last chapter, "O. K.," is reached. Copies promptly mailed, postage prepaid, on receipt of price, 75 Cents, by Currency, Post Office Order, or Postage stamps.

W. J. JOHNSTON, Publisher,  
No. 9 MURRAY STREET, N. Y.

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

<b>PRE-ELECTRIC TELEGRAPHS.</b> .....	7
Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "telegraph"—Prediction quoted by Addison.	
<b>THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.</b> .....	14
First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.	
<b>INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S.</b> .....	29
First American line—Apathy of scientists, press and public—Why the <i>Herald</i> refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkey and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabbers, who dug the post holes?"	
<b>A CHAPTER ABOUT OPERATORS AND MESSENGERS.</b> .....	50
The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning striker's" blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Uniformed messenger mistaken for policeman.	
<b>THE TELEGRAPH IN WAR.</b> .....	70
Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators' ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.	
<b>CABLE TELEGRAPHS.</b> .....	85
General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discouragements—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.	
<b>HUMORS OF THE TELEGRAPH.</b> .....	107
Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Ragsell"—Peter to Margaret Flagarty—He couldn't be fooled—"She writes like a man"—Model (?) Maine man—Hollow and "helio"—Fooling savages—"Onnateral fixins"—Chicago and "Witt"—Illustration—Electrifying loafers—Shocking the negroes—Pind-folding the "masheen"—A crammer.	
<b>TELEGRAPHIC "BULLS."</b> .....	123
A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Air or oil—Too much coffee—Blessings in disguise—A profitable mistake—A military "bull" that was not all a "bull"—Senders' "bulls"—Habit and habit—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.	
<b>LIGHTNING FREAKS AND TRAGEDIES.</b> .....	138
Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.	
<b>SHARP PRACTICE BY TELEGRAPH.</b> .....	143
Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operator—Fampering with cipher message—The biters bit—Great bank swindle—Barb's telegraphic trap for burglars.	
<b>THE TELEGRAPH AN UNIVERSAL INSTITUTION.</b> .....	160
A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—In Africa.	
<b>THE WEATHER REPORTS.</b> .....	168
Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.	
<b>THE RAILROAD TELEGRAPHIC SYSTEM</b> .....	179
Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-supporific.	
<b>ELECTRICITY AND LIFE.</b> .....	202
General remarks—Electric girl of La Perriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.	
<b>OUTGROWTHS OF THE TELEGRAPH.</b> .....	218
The electric light—Edison's description—The light at Niagara—Experiments in San Francisco—Proposed illumination of Holyoke—Use in stores, steamships, and in war—The telephone—How constructed—The German name for it—Its invention—Telephone service meter—Transmitting sermons by telephone—First instance—Mr. Beecher's—The telephone in Jersey City law courts—Communicating between ships—Use in wooing—In military operations—Music—Humors of the telephone—The singing telephone—Yarn from Pine Bluff—Joke on reporters—One for Dawdles—Marriage by telephone—Telegraphing by light—The photophone—Electrical egg hatching and seed germination—Theatrical thunder—Toothache cured by electricity—Gas lighting and bell ringing by same means—Electricity as an umbrella—In taming horses—In connection with Moody and Sankey's meetings—Telegraphing by electrical air currents—Maps by telegraph—Magnetic magic writing—Electric driving power—Electricity in managing refractory horses—Engraving by electricity—Diagrams of targets over the wire—Electric combs and brushes—New uses for the sun's rays—The ocean a source of electricity—Suggested use of electricity in executing criminals—Slaughtering cattle and killing whales by electricity—Electric clocks that require no winding—Telegraphing by steam at sea—Electricity in steam—The Edison electric locomotive—Description of it—Electricity aiding weary cash girls—Conclusion.	

Copies promptly mailed, prepaid, on receipt of price, \$1.

W. J. JOHNSTON, Publisher,

P. O. Box, 3,332.

No. 9 Murray Street, New York.

PRICE REDUCED TO ONE DOLLAR.

## Lightning Flashes and Electric Dashes,

A VOLUME OF

Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.

CONTRIBUTED TO BY

ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.

COPIOUSLY ILLUSTRATED.

176 Large Octavo Pages. Cloth. Price, \$1.

This book is a lasting example of the literary talent and native wit of American telegraphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader*.

"Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic*.

"The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent*.

"Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist*.

THE OPERATOR, 15 Months, and Lightning Flashes, only \$2.00.

## DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together the purchaser may deduct

25 Per Cent.

from the regular retail price before remitting. The books will then be forwarded, post age or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and THE OPERATOR for fifteen months in connection with any one dollar book for \$2.00.

## How Enterprising Operators may Add to their Incomes.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

W. J. JOHNSTON, Publisher,

P. O. Box 3,332.

No. 9 Murray Street, New York.

## Telegraphers Should Remember

That they can always get anything that they may require, whether in the line of telegraphic goods or not, AT THE VERY LOWEST MANUFACTURERS' PRICES, by sending their order to the publisher of THE OPERATOR.

## They Ought to Know

That we have a Purchasing Agency which does a business of Thousands of Dollars a year for telegraphers, and always to the latter's satisfaction, MANY NOW PURCHASING ALL THE GOODS THEY REQUIRE THROUGH US.

## No Matter What You Want,

whether it be telegraphic or not, send the order to us. We will fill it of the BEST QUALITY, AND AT AS LOW A PRICE AS ANYBODY ELSE CAN POSSIBLY DO.

## Telegraphers are Invited

to avail themselves freely of the advantages of The Operator Purchasing Agency. We make no charge for our trouble, and always furnish goods at lowest manufacturers' prices.

Any book, newspaper, or magazine published whether telegraphic or otherwise, will be sent, prepaid by mail, to any address in the United States or Canada on receipt of publisher's price.

W. J. JOHNSTON, Publisher,  
No. 9 Murray Street, New York.

## Scarf Pins and Bosom Pins, IN THE FORM OF Miniature Telephones.

These articles of jewelry are of the Best Workmanship in Gold, and aside from their distinctive merits as Emblematic of the Telephone Profession they are Unique and Elegant Ornaments.

TELEPHONE PIN (full size).

The above cut shows the Miniature Telephone, full size, fitted as a Badge or 1-1/2 in Pin. The Scarf Pins are fitted with long straight pins instead of the short clasp pins. We are now ready to supply this fine jewelry at the following extremely low prices:

	Solid Gold.	Rolled Gold.
Telephone Badge or Bosom Pin ....	\$5.00	\$2.00
Telephone Scarf Pin .....	5.00	2.00

Sent by mail post-paid and registered on receipt of price.

Address, **W. J. Johnston,**  
P. O. Box 3,332. No. 9 Murray Street, New York.

## OFFICE OF THE Superintendent of the Police and Fire Alarm Telegraph,

Southwest corner of 5th and Chestnut Sts.

Proposals for Instruments and Supplies for the extension and improvement of the Fire Alarm Telegraph of the city of Philadelphia, for the Central Office (complete except woodwork).

Sealed proposals for furnishing Switch-board and Annunciator, Magnetic Call Bells, Telegraph Keys, Galvanometers, Relay Magnets, Registers and Repeaters required for the Central Office of the Police and Fire Alarm Telegraph, to be placed in position and connected together, ready for use, in complete working order, in the office provided for that purpose in the new City Hall, Broad and Market streets, as authorized by the ordinance for "the Extension and Improvement of the Fire Alarm Telegraph of the city of Philadelphia," will be received at the above office until 1 o'clock P. M., on Tuesday, July 19, 1881. Bidders will apply at the office of the department for information as to samples and blanks.

W. J. PHILLIPS, Superintendent.

## TELEGRAPHIC SPECIALTIES, THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5 00.

### THE DELANY PATENT REVOLVING DISC, OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevent operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

### CHAMPION LIGHTNING ARRESTER. CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

### THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

### PREMIUM LEARNERS' APPARATUS.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit.....	Money in advance, \$5 00

A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE.

## THE AMERICAN POPULAR DICTIONARY:

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons: It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than The American Popular.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the American Popular Dictionary, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—*N. Y. Times.*

A perfect dictionary and library of reference.—*Leslie's Illus. News, N. Y.*

We have never seen its equal, either in price, finish or contents.—*Chris. Advocate.*

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary, only \$2.00.

### SAM JOHNSON:

The Experience and Observations of a Railroad Telegraph Operator.

By J. ALBERT CLIPPINGER,

Author of "The Pedagogue of Widow's Guich," "Samson" Papers, etc.

176 Pages. Price, in Paper, 75c.; in Cloth, \$1.

This book consists of a series of short stories or sketches, illustrative of the checkered life and experience of a representative Railroad Telegraph Operator—a near view of the daily and nightly working of the busy bees who manipulate the two greatest agents of modern civilization—electricity and steam.

"Sam Johnson is one of the most entertaining books in the whole library of railroad literature. It is a series of well-told sketches and stories relating to every phase of railroad life. Some are humorous, some thrilling, some pathetic, and all interesting. The book is written by a practical railroad operator, with a ready pen and a quick eye for the salient points of a joke or incident."—*Railroader.*

## TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY.

A POPULAR ACCOUNT OF

The Electric Telegraph: Its Uses, Extent and Outgrowths.

By W. J. JOHNSTON, Editor of THE OPERATOR.

254 PAGES. - - - CLOTH. PRICE, \$1.

# The American Bell Telephone Company

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

## District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

## PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

### A FRAGMENT.

With tender care is softly pressed  
A trifle dear, a loving note,  
Against her warmly-glowing breast—  
A little missive which I wrote.

But o'er the ripe lips ne'er I'll gloat;  
Her bosom's glow I but admire.  
A telegram, the treasured note,  
I merely took from off the wire.

OAKLAND, Cal.

FRANK C. PRESCOTT.

### Respectfully Referred.

If we may judge from the newspapers and private correspondents, there is a wide field for an opposition company with live managers and properly paid operators along the Missouri river. Kansas City particularly seems to need the attention of the executive officers. The following, from the Atchison (Kan.) *Globe* of July 13, is scarcely too weak for the occasion.

"Public meetings have recently been held in Kansas City and St. Joe to complain of the abominable management of the Western Union Telegraph Company. The only remedy is a new company; it does no good to complain to a monopoly. It seems reasonable that the business men of the various cities East and West could organize a company, and not only secure reliable telegraph service, but profits as well. The rapidity with which the American Union jumped into favor shows what can be done in this direction."

The following is an extract from a letter from a disgusted citizen, printed in the *Kansas City Journal* of July 14th:

"A large portion of our business is transacted by telegraph, and we have suffered greatly through the inefficiency of the employes of the telegraph company. Complaints to the manager are of no avail, and are not now made use of; we simply bear it, and wait for a chance to grin, meanwhile praying for the formation of a company with lines to Chicago and St. Louis. A large proportion of the capital required to construct such lines can be raised in Kansas City among our business men."

Another letter, signed "Business," printed in the *Journal*, among other things says:

"Utter incapacity and inability to meet the wants of the public have made the use of the wire from this city extremely dangerous in any business where promptness and accuracy are a necessity. I suggest a partial remedy. Let a merchants' telegraph company be formed at once."

The *Kansas City Journal* of July 13 says editorially:

"The people of St. Joe and Kansas City are for once in sympathy. At least there is one subject of common interest in which both take much the same view. A public meeting was held in

that city last week to hear complaints about the telegraph service of the Western Union company. A number of prominent business men spoke of delays and errors which were becoming not only annoying but burdensome, and all attributed the irregularities to the incompetence of employes rather than to the crowd of business or insufficient facilities. There is a great deal of complaint of the kind in this city, but whether the fault is in the local management or an attempt at too much economy on the part of the company, there may be a question. It is certain, however, that the office here is the largest west of the Mississippi, and should have enough first-class operators to receive and transmit messages without delay or error; but the facts are that very much of the business done is decidedly indifferent both in regard to time and manner. If the company will not appropriate sufficient money to pay good operators, then an effort should be made to hasten the building of other lines; if the fault is alone with the management of the office here, the matter should be brought to the attention of the officials of the company. At the St. Joe meeting the manager of the local office admitted the charges, but said after frequent demands the company had failed to give him the proper help to conduct the business of the office as it should be, and stated that the office had recently been changed from the jurisdiction of the superintendent at St. Louis, to that of the superintendent at Omaha, who assured him that he would add to the force there and endeavor to alleviate the complaints."

The same paper of July 14th says, editorially:

"Assurances are given that the lines (opposition) now in process of construction from New York to the West will be extended to Kansas City within another year. The complaint is made by the local management here and elsewhere that good operators cannot be had, while the operators say that the fault is entirely with the company in paying such low wages that good operators are leaving the business as fast as they can get other employment."

We have not room for further extracts, but the tenor of them all is that a live opposition is sorely needed in the West, and that it will be warmly welcomed, both by the public and the operators. In one case, on Monday, the 11th, ult., we learn that some stupid official issued a circular to the customers, stating that thereafter no due-bills would be received at the counter from any individual or company. Several firms offered to deposit \$100 or more, from which the amount of their bills might be deducted each day; but no, "pay each message," was their only answer. Referring to the economical manager's plea that he cannot get good operators, we may quote from a private letter:

"Operators that get \$55 and \$60 here go to Chicago at \$70 and \$75. The 'extra' here is computed at nine hours per day, and at the salary rate—that is, if you get \$50 per month, and work three days extra, you will receive

three days' wages at the rate of \$50 per month. Now, what operator will willingly stay in a third story, weather "at par," and work for from 12 to 29 cents per hour, after a hard day's work? This office is the largest "roast" for operators of ability that you can find in the States, and they pay the smallest salaries. The best operators get \$75 per month—if they stay long enough—and when there is a rush of overland business the way the two or three \$75 men are put to the front causes two or three resignations. Why? 'Oh, I can get \$95 in Chicago by working a little extra, and not near such hard work as this.'"

These facts are somewhat crudely put together, but the controlling idea is there: skinflint policy, poor pay, bad work, loss of custom, new company, collapse. It is not very unlikely that a local company will soon string a wire or two between Kansas City, St. Louis and Chicago, to connect with the nearest opposition.

All this foolishness is creating havoc with the business, and will eventually, if permitted to go on, undo the good work of General Eckert and those immediately connected with him. We have some other well fortified cases which should be looked into; and if any "manager" feels that he has thus been sacrificing himself upon the altar of economy, it behooves him to cook up his array of excuses. Kansas City is not the worst telegraphic hole in the country.

### The Telegraph Litigation.

With the settlement of the Williams and Hatch suits against the consolidated Western Union, it was generally believed that the legal troubles of that company had come to an end. Much surprise was, therefore, caused when, on the 15th ult., it was announced that another injunction had been granted, on the application of Jenkins Van Schaick, one of the witnesses in the Williams suit. The averments were substantially the same as those in the Williams and Hatch suits. Upon that day, July 15th, the Western Union had publicly announced its intention of paying the dividends. A large number of stockholders were already paid before the injunction was served, but after that no further payments were made. The effect of the injunction was to stop the payment of dividends on even the old original stock of the company for the reason that the new stock is in the hands of the general public, and many persons hold shares of both the old and new issues. The stockholders' checks, drawn against the Union Trust Company, do not designate the shares by their certificate numbers, and it was therefore impossible to distinguish between the old and the new. The order was granted by

Justice Joseph F. Barnard, in the Supreme Court at Poughkeepsie. It restrained the payment by the trust company, as fiscal agents of the telegraph company, of the two quarterly dividends of  $1\frac{1}{2}$  per cent., 3 per cent. in all, due on the extra issue of \$15,526,590 in stock authorized under the consolidation of the telegraph companies. It also restrained the telegraph company from transferring that particular stock on its books.

This would have caused much inconvenience to the stockholders but for the spirited action of Mr. Jay Gould, who promptly announced that he would pay the dividends out of his own pocket. The following note was accordingly sent to the newspapers on the afternoon of that day: In view of the serious inconvenience to many persons from malicious and vexatious suits against the Western Union Telegraph Company, I have arranged with the Mercantile Trust Company to advance to all stockholders of the Western Union Telegraph Company the amount of their dividend, payable this day, upon assignment to me at the office of the said trust company of their right to receive the same. JAY GOULD.

On the following day, July 16, the case assumed a different and more equitable aspect. The Western Union lawyers appeared before Judge Barnard, at Poughkeepsie, producing affidavits to prove that, out of the \$15,526,590 of stock enjoined, \$13,000,000 had already been distributed. They stated further that the telegraph company would enter in any bond or make any deposit Judge Barnard might direct to fully indemnify the plaintiff. They urged that the suit had no foundation, and was only a stock-jobbing operation, precisely identical with the Williams and Hatch suits, which had been decided in favor of the company. Judge Barnard said that at the time of granting the injunction he asked Mr. Sessions, the attorney for Mr. Van Schaick, whether his papers showed that none of the \$15,000,000 increase, or "water," had been distributed, and that Mr. Sessions said he knew it to be a fact, and that his papers showed that not a dollar of the increased capital stock had been distributed. Judge Barnard said it was only on the faith of these representations that he granted the injunction. He thereupon made an order vacating the injunction and directing a hearing in the matter to take place on July 23, at Poughkeepsie.

The spectacle of a judge admitting the weakness of a case by vacating his own injunction within 24 hours after issuing it showed that no serious consequences to the monopoly would follow. Judge Barnard's plea that he was misled by Van Schaick's counsel stands for nothing, since it was just as illegal to pay out a thousand dollars in dividends as to pay out thirteen millions of dollars, and just as illegal to pay out any portion of thirteen millions of dollars as to pay out the whole. If the injunction ought ever to have been issued to stop the payment of dividends at all, it ought to have been issued to stop the payment of them at any stage of the operation. If the company had illegally paid \$13,000,000 out of \$15,000,000 when the injunction was served, the injunction ought to have stopped the illegal payment of the remaining \$2,000,000.

On the 23d ult., the day set for argument, the matter did not come up, as Mr. Jenkins Van Schaick and other interested parties had consented to a vacation of the action so far as the injunction was concerned.

On the 20th ult., in the Superior Court, Judge Charles H. Truax handed down a decision against Messrs. Rufus Hatch and William S. Williams, assessing them \$2,000 each for the luxury of an unsuccessful suit against the consolidation. This is as it should be, and if the Court will now assess Mr. Van Schaick \$2,000 for his silly performance, these men may find it more profitable to devote their energies to the establishment of a good, reliable opposition rather than to the devious ways of our law courts.

Thaddeus Poucher, now living in Oswego, this State, says he helped to set the first telegraph pole ever raised in the world. It was picked from a pile of ordinary hop poles and was one of nine which Mr. Morse used to hang a test wire upon which ran from his house to his barn, near Poughkeepsie.

## Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 144. What electrical tests should telegraph wire be required to pass?

A. Electrical tests are more especially necessary when the wire is to be used on long circuits. The electrical properties of wire have been found to vary considerably, and frequently the strongest and most ductile wire, or that which tested mechanically is the best; when electrically tested, is found to be much inferior for telegraphic purposes to other wires by no means so good otherwise.

The only test much used, however, is for resistance. The ordinary practice in this country is when ordering wire to stipulate that the resistance of the wire in ohms per mile, at 60 degrees Fahr., must not exceed the quotient of the number 5,500 divided by the weight of the wire in pounds per mile. For example, if we order No. 12 wire and assume the weight to be 165 pounds per mile, to find out what resistance we require, we divide 5,500 by 165. Finding the quotient to be  $33\frac{1}{3}$ , we order No. 12 wire, 165 pounds to the mile, and with a resistance not higher than  $33\frac{1}{3}$  ohms per mile. Similarly, a wire No. 9—which we will call 325 pounds per mile—should have a resistance not greater than 5,500 divided by 325; viz.,  $16\frac{2}{3}$  ohms.

Q. 145. What is meant by the "killing" of wire?

A. It is a term much used in England, where it is applied to the process of stretching the line wire in a cold state before stringing it. The average amount of length gained by thus stretching should be two inches in every hundred. The purpose of the operation is not to increase the length of the wire, but it is that weak places, caused by bad joints, bad welds or other imperfections, may be detected and the wire broken before it is strung; avoiding thus the annoyance of subsequent breakage and the trouble and delay attending the necessary repairs. Not only are these weak places detected by this process, but the small bends and wrinkles existing in ordinary wire are straightened out, the wire is rendered less springy, more manageable, and has much less tendency to cross with other wires when acted on by the wind. The method of killing is by Mr. Culley described in the following words: "The wire should be laid out at the feet of the poles, drawn as tight as possible by ropes and blocks, and then pulled at the centre of its length, at a right angle, till it stretches. It will be found to have lost its spring and to lie on the ground as if it had been killed."

Q. 146. What is meant by the term "galvanized wire?"

A. When we speak of "galvanized wire," we mean nothing more nor less than zinc-coated wire; and the term galvanization is sadly misapplied when so used. But the expression has, by constant usage, become so firmly fixed in the telegraphic profession, that it is hopeless, at this late day, to attempt its abandonment.

Telegraph wire is nearly always galvanized, in order to preserve it from destruction by the oxygen of the air. If not so protected, the wire is eaten away by rust very rapidly. When properly applied, the zinc coating is very effectual in preserving the iron wire from oxidation, and this it accomplishes in two ways: First, by acting as a mechanical covering and protection for the iron wire. Secondly, by its electrical qualities being more electro positive than iron; that is, having a greater affinity for oxygen than iron; when associated with it, the iron is protected from the action of the oxygen, at the expense of the zinc. But when the zinc is attacked by the atmospheric oxygen, it is converted into oxide of zinc. This, not being soluble in water, remains on the wire, and so protects it from corrosion.

In the vicinity of places where much coal is burned, however, the air is heavily charged with sulphurous acid gas, which transmits the oxide of zinc into sulphate of zinc, and this salt being readily soluble in water, soon is washed away, leaving the iron unprotected. This is the reason that iron wire in the vicinity of large manufacturing towns so soon rusts away. If it can be done, it is a very good plan to paint wires in

such localities. Galvanizing is now performed in a much more effective and efficient manner than it used to be; and as the wire is by the same process annealed, its mechanical qualities are left comparatively unimpaired; still the iron is by the process made a little harder.

Q. 147. What are the different styles of line-wire joint or splice in general use? how are they made and which is the best?

A. The joint in general use in America is the common twist joint. The Britannia joint is also used in England, and a peculiar joint, in which both wire ends are twisted together round each other, is used in France. A joint which should never under any circumstances be used anywhere, is the "bell-hangers' joint."

In describing how they are made, we will take the last first. The bell-hangers' joint is made by simply hooking the two wires together and bending back the ends. No telegraph man using this, even as a makeshift, can hope for success.

The French joint is made by laying the ends to be spliced together for about six inches, a particular form of hand vise is then screwed to each end and the two vises turned in opposite directions, until the ends are completely wound on.

The Britannia joint is much praised by English writers, and from its construction must necessarily be an excellent joint. It is made by bending the extreme ends of the wires short up with the pliers, placing the wires side by side and then binding No. 16 wire tightly around them. The whole is then well soldered. Of course, before making the joint, the ends are made perfectly clean and bright.

The American twist joint, though not a masterpiece of electrical engineering, yet will always maintain its popularity on account of the ease and rapidity with which it is made. In making this joint, after cleaning the ends until a bright metallic surface is obtained, the ends are put together and each one in turn twisted round the other, making the successive turns as close to each other and as nearly at right angles to the line as possible. Make four or five turns, then cut off the ends close to the splice. In the construction of a line nothing is more essential to its success than the perfection of its joints. Not near the attention that the subject deserves has in this country been given to it.

Every joint should be soldered, whether between iron and iron, or between iron and copper. A single defective joint will often exceed fifty miles of line in resistance. A case once fell within the writer's own experience, where a short local line, whose normal resistance was less than 250 ohms, rose to 2,500 ohms. This resistance was located and found to be all in one point, between an iron and a copper wire; the joint was unsoldered.

When a chloride of zinc solution is used for soldering copper and iron, before leaving the joint it should be washed off. It is better, however, in such a case, to use resin as a flux.

## The Atlantic Cable Companies.

The steamer *Faraday*, having successfully laid the first of the American cables, has returned to England and, on the 21st ult., landed the shore end of the second cable at Whitesand Bay, near Land's End, Cornwall. Both of these cables will be working before the end of this year. Siemens Brothers are also now at work manufacturing the third cable for the American Company.

This announcement has been promptly followed by a reduction of rates to 25 cents per word, commencing to-day, on the part of the older companies. A dispatch from Berlin, recently, states also that the United German Telegraph Company has entered into an agreement to use the cables of the Anglo-American Company exclusively, and not those of any other company. Connection will be established with Valentia by wire from Crete, East Friesland, passing through the British Channel and around the west coast of Ireland. Telegraphing to America from Germany will consequently be as cheap as from England.

Then, we learn upon the authority of the

London *Morning Post*, that the Germans will attempt to lay an Atlantic cable of their own. The *Post* says: By an arrangement just concluded between the German Telegraph Company of Berlin and the German Union Telegraph Company an independent cable will be laid from Germany to Valencia, and thence to the United States at a cost of £165,000 (\$825,000). The capital will be raised by an issue of preference shares bearing 5½ per cent. interest. A subsequent dispatch states that the cable will be laid from Emden, Prussia.

This would give us ten cables under the Atlantic, viz.: The Anglo-American, 4; the Direct United States, 1; the New French, 1; the American, 3; and the German Company, 1. As most of these would be duplexed, and as there is certainly a limit which cable business ceases to be profitable, it seems probable that some of the heavily loaded concerns will soon be unable to pay dividends.

When the first line was opened in 1866 the charge was \$100 for 20 words. It was not until some years later that the word rate was introduced. At this rate the daily average number of messages was 29 and the receipts per diem were \$3,785. Three months later the tariff was reduced to \$50 for 20 words, and at this rate the number of messages increased to 64 per diem, while the daily receipts only increased to \$4,340. The next change was made by charging a slightly higher rate, but allowing shorter messages. A message containing only ten words was sent for \$26, and at this rate the number of messages doubled, the daily average being 131 against the former 64. But as these messages were only half the length, the receipts were only \$4,170. The rate was then gradually reduced to \$10 for ten words, but the reduction proved disastrous, the daily number of messages increasing to 226, and the daily receipts falling off to \$3,740. This was in 1869, and in 1870 the first French line was laid. A brisk competition began, and the rate was reduced to \$7.50 for ten words. Business at the time was very active, and the daily number of messages sent across the Atlantic was no less than 452, while the receipts were \$5,655. An amalgamation of the two rival companies then took place, and on Dec. 12, 1870, the rate was doubled. Under the new rate the average number of messages fell off for the first time in the history of cabling, but the receipts reached the then enormous total of \$8,870 per diem. A subsequent reduction to \$10 a message showed a falling off in the receipts, and upon May 1, 1872, the old system of ten-word messages was done away with, and a uniform charge of \$1 a word was instituted. The popularity of the change was at once shown by a large increase in the number of messages. The daily average sprang suddenly from 498 to 646, and the receipts showed an equally satisfactory increase. Those were the palmy days of cable telegraphy, as an experiment which was made during the month of May, 1873, shows. The rate during that month was raised to \$1.50 a word, the daily number of messages being 558 and the daily receipts \$12,000. What a contrast this is to the profits at the present time will be seen when it is mentioned that the present daily receipts are only \$13,075, while the number of messages is about 3,500 per diem!

#### Chicago Notes.

*To the Editor of The Operator:*

SIR: The operators of Chicago (I believe in common with others of the W. U. elsewhere) last pay day, July 15, received, for their faithful services during long hours on the days of July 3 and 4—immediately following the assault upon the life of the President—a benefit, a complete surprise, which was highly and thankfully appreciated. It came in the shape of a shower of greenbacks—"double extra" being paid to the industrious on the dates named. There were also quite a number of operators who had been working for \$70 per month notified that their salaries had been increased to \$80, dating from June 1—they receiving back pay for the intervening time. This, added to the "extra," came as a double surprise to many, and, consequently, exceeding good feeling toward those credited with the kind and thoughtful visitation has been becomingly and generally expressed. The whole affair being so out of the general order of things

marking the past career of the company, we are happier in feeling disposed to look upon it as indicating a policy that is to reach into the future with purposes and endeavors to bestow a just reward upon true merit and faithful performances generally.

Your correspondent is pleased in reporting at this time that the Brotherhood of Telegraphers is in a very healthful and flourishing condition, both numerically and financially, some twenty new members "riding the goat" at our last meeting. The society is popular, because its purposes are praiseworthy; because it contemplates the accomplishment of more benefits, perhaps, than proposed by any of their past unions, but in a manner quite different, because it is free from the possibilities of dangerous rulings to precipitate them and the company into incalculable difficulties; because it is to prove a permanent and constant friend to all worthy members, in life, in sickness and in death.

New arrivals: Miss Clark, Miss Bracken, Mrs. Darrow, J. F. Lilly, Muskegon; Jim Coulter and John Dickson, Bradford, Pa.; George Anderson and Gifford, Milwaukee; Pete Smering, Toney Martha, from Buffalo; Frank Kent, St. Louis, and a number of others whose names we were unable to learn.

Departures: Ed. Ball returned to Indianapolis, Ind.; Ed Dodge somewhere in New York State as station master on N. Y. C. Geo. Hall and W. A. Leary, assistant chiefs, have quit the business, going out West. Perry Chamberlain, on his way to Omaha, paid us a flying visit recently; Sam. O. Bracken has been appointed chief to succeed Chief Leary, resigned; Billy Halligan succeeds Mr. Bracken, John Nestal takes Halligan's N. Y. div., H. R. Clark has been appointed chief of the checks, vice McM. resigned.

#### Topeka (Kan.) Notes.

*To the Editor of The Operator:*

SIR: Since my last the following changes have taken place among the telegraphic fraternity in this city: Mr. W. B. Paddock, who for two years has been press operator at the Western Union office, resigned on June 1st to accept a position with the A., T. & S. F. R. R., at this point; Mr. R. M. Elliott, of St. Louis, is his successor. Mr. J. D. Gibbs, an artist of the highest order, is an addition to the W. U. force. Mr. Lester G. Brewer, late Board of Trade operator, has accepted a position with the W. U. at Kansas City. Mr. Geo. C. Sperry, for a long time operator in the general offices of the A., T. & S. F. R. R., has been promoted to the position of stenographer to Mr. R. B. Gemmell, the popular Superintendent of the above road. Mr. Sperry was succeeded by Mr. C. P. Forman, of the A., T. & S. F. depot office. Mr. Frank Mullen, late operator at the A., T. & S. F. machine shops, has been transferred to that company's lines in New Mexico, and his place here is now occupied by Mr. Wm. H. Mayer, recently from one of the New York elevated roads. Mr. A. W. Parks, for some time manager at the A., T. & S. F. depot, has been transferred to that company's office at Newton, Kan., vice Mr. W. J. Ross, who assumes Mr. Parks' duties here. Mr. M. J. Nichols, of the Union Pacific depot, has resigned to accept a more lucrative position as clerk in the freight office of the same company. Mr. W. A. Campbell, late of Wamego, Kan., succeeds him as operator. Mr. J. W. Walker, night operator at the M. P. depot, has been transferred to Wallace, Kan., and his place here is now filled by Mr. J. F. Cunningham, recently from the W., St. L. & P. R. R. KANSAS.

#### Alexandria (Va.) Notes.

*To the Editor of The Operator:*

SIR: The W. U. is now doing a splendid business here. Owing to reduction of rates, and the increased prosperity of the town, the number of messages handled daily is more than double that done two or three years ago. As there are ten tables to watch, customers' counter and delivery department to attend to, some fifty-odd wires to test, commencing at 6.30 A. M. and lasting all day, and about 150 to 200 messages per day to handle, Mr. Gentry, the manager, has fully as much to perform as any one man would like to undertake. The Va. Mid. R. Co. is doing a large business now. Mr. J. Fisher, superintendent of telegraph and master of trans-

portation, has the affection of all his employes from Washington, D. C., to the North Carolina line. He is ably assisted here by Messrs Dinwiddie, chief, and Peyton, Smithers and Buckley, dispatchers. Their office is very uncomfortable and considered unhealthy. Mr. Dinwiddie has just recovered from a severe illness. Mr. Buckley is now sick in bed with malarial fever; Mr. Pierce, from Lynchburg, substitute. Mr. Smithers, a handsome man of 200 lbs. weight six months since, has also secured a leave of absence to recuperate. He now weighs only 150 lbs.; Mr. Rohr, from Lynchburg, substitute. The B. & P. R. Co. have at their local depot Mr. Barnes; at St. Asaph Street Junction, Messrs. Duncan and Givens; at Long Bridge, Messrs. Peverell and Duncan. The W. & O. R. R. have in their superintendent's office Mr. W. A. Macomb of Georgetown, D. C. The W. U. has at Partner's Brewery Mr. C. Valer, from Germany, and at "Fishtown" office E. R. Lowe. There are no unemployed operators in hearing of this place. "THE WHAUP."

#### Buffalo (N. Y.) Notes.

*To the Editor of The Operator:*

SIR: The organization of our men into a protective union was effected late in June, with twenty-one members. We now number fifty, out of an office force of less than seventy-five; the remainder of whom, together with a hundred or more branch and railroad operators in the neighborhood, we shall soon enroll. We are also establishing branches throughout Western New York. The sentiment in favor of the movement is lively, and though the work is rapid, it bears no evidence of being superficial. The officers at this city are as follows: J. H. McMahon, Chief; O. J. Begley, Vice-Chief; W. G. Patterson, Secretary; A. N. Gardner, Treasurer.

Our secretary would be pleased to communicate with the organizations in other cities throughout the country as to progress, sentiments and prospects.

Business is booming in the office, and the "extra" force is correspondingly large, most of the men doing double duty. Mr. A. J. Gallagher has resigned to accept work elsewhere. Mr. P. Smering has also resigned and gone to Chicago. We hear that Messrs. Watts and Roesch leave us on the first. They are Union men and we regret their loss. The arrivals are Messrs. Prentice, from Chicago; Tom Henning, formerly employed here; Remy, from everywhere; Ryerson and Goodell, "extra," and John M. Mayo from New York. A number of the boys have recently applied for increased salaries; in most cases being just demands they will probably be acceded to. "BU."

#### Portland (Me.) Notes.

*To the Editor of The Operator:*

SIR: The summer business has started, and again the tourist is seen wandering through our beautiful city. Telegraphically, business is good. Our day force is three operators less than last year. Several Eastern offices have been put on a through circuit to Boston, somewhat reducing the work, which had heretofore been repeated. The old time operators are still to be found on duty, so it will not be necessary to name the force. Howard A. Black, formerly our third man on Boston quad, has had a very severe attack of rheumatism. He has been confined to his bed at his home in Calais, Me., for the past three months. Last accounts report him better. A. G. Saylor, one of our quad operators, was married a short time ago, and made a trip through the mountains. He returned after a very enjoyable tour, looking hale and hearty. He has the well wishes of us all. O. J. Neff was in the city a few days ago. It is rumored that he is connected with the Mutual Union, who expect to open here by Nov. 1. We hope the rumor may prove true. H. C.

One of the telegraphers who carried a telegram to the President was asked by him if there had been many dispatches received that day regarding his misfortune. The operator replied: "Yes sir, quite a number expressing sympathy for you." The President responded, good-humoredly, "Excuse me for correcting you, but 'sympathy with me' would be better. Be careful of your grammar."

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher

NEW YORK, AUGUST 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### WHO IS RESPONSIBLE?

Notwithstanding the explicit denial of certain officials high in office, it is still plainly hinted by our correspondents that various local superintendents, south and west of this city, have been, or are now, reducing salaries, either directly by a sweeping order, or indirectly by increasing the hours of labor or by discharging old hands to make room for new men at lower salaries; and that, too, seemingly, without sanction from headquarters.

From these conflicting statements—the alleged sufferers on the one side and the aforesaid officials high in office on the other—many inferences may be had, some of which we shall enumerate.

First. We might infer that the hereinbefore-mentioned officials high in office are quiet, easy-going gentlemen of a peculiarly guileless and childlike nature, too unsuspecting and altogether too utterly utter to perceive wicked doings right under their very noses. We can dismiss this theory at once, so far as it affects General Eckert, since his great reputation as the telegraphers' friend has been too dearly bought to sacrifice it now in the full meridian of his success.

Second. We might infer that the understrappers in question are playing an uncommonly fine game on their superiors by taking the responsibility on their own shoulders and making capital for themselves by a general showing of "reduced expenses," without saying a word at headquarters about reductions of salary—all of which is contrary to the implied and expressed wishes of Gen. Eckert. This may be true of a good many, but we must, in view of recent events, take Chicago from that list. The managers there seem to read the handwriting on the wall about as well as anyone.

Third. Since it has become a question of veracity, we might infer that the whole thing is an organized and wicked attempt on the part of certain depraved correspondents and newspapers to belittle the new management, and to bamboozle *THE OPERATOR*. In that case we should have to produce our list of alleged victims, and, of course, hear from them further. But we have trusted, and been trusted by, "the boys" too long to admit of that theory; we hold too much in common with them, and have battled side by side with them too long to mistrust them.

But if, after all, the stories be true—that is, if the said local officials have, since the consolidation, cut down salaries or increased hours of labor unreasonably, as is alleged on the one side and emphatically denied on the other—the sooner they are removed from office the better it will

be for the general service. Men whose selfish zeal for official recognition so far outruns their natural store of discretion as to lead them to alienate the loyalty of subordinates from the company, or to endanger its public patronage, were intended by nature to adorn a detective agency, or to shine as sheriff's constables, and they are altogether out of their sphere when trying to act as telegraph officials. Surely the proud consciousness of true manhood which is believed to swell every American breast until it assumes the beautiful curve of the dove's must be oozing out, when, in this great country, the saying is verified that "Thrift follows fawning;" when pettifogging officials, ignominiously crawling from danger, can be found willing to hack away at the miserable pittance of their fellow man, in the selfish hope of obtaining thereby some unmerited preferment which they could not otherwise obtain.

This question has been forced upon us, first by the asseverations of presumably reliable persons, and afterward by the emphatic denial of other persons high in office. We have commenced with Kansas City, and will take up other proofs subsequently. The charges are either true or not true. If false, we shall be the first to denounce those who may have sought to mislead us. If true, the remedy should be applied at once, and no true man will be sorry when General Eckert sits down—hard—upon the devastating policy of those sub-officials who have no higher object than to "make a good showing" financially.

THE British postal authorities, in reluctantly acceding to some of the demands of the operators, seem inclined to deny, with characteristic stupidity, the right of their employés to agitate any question of redress. The government's last manifesto, after stating that "my Lords accept the proposals which you submit to them for improving the pay and general position of the telegraphers and sorting clerks employed in the service of the Post-Office in London and in the country," proceeds:

"But my Lords cannot shut their eyes to the means by which the claims for this improvement in the terms of service have been urged upon the government by a part of the officers interested. Admitting, as my Lords do, that when discontent is shown to prevail extensively in any branch of the public service, it calls for attention and inquiry, and so far as it is proved to be well-founded, for redress, they are not prepared to acquiesce in any organized agitation which openly seeks to bring its extensive voting power to bear on the House of Commons against the Executive Government, responsible for conducting in detail the administration of the country. \* \* \* \* My Lords, therefore, reserve to themselves the power of directing that the execution of the terms agreed to in the preceding part of this letter be suspended in any post office of which the members are henceforth known to be taking part in extra official agitation." Since our English professional brethren have made their point only by the power of their admirable organization and discipline, it is not likely that they will be intimidated now by this threat on the part of her majesty's government. They have proved that in union there is strength, and the government in this remarkable document admits the strength of such a union, so that when the operators next have a grievance, it is rather too much to ask them not to resort to "organized agitation." The coolness of "my Lords" is decidedly refreshing.

At a meeting of the managers of the newly formed Mutual Union Telegraph Company, held in Boston, July 27, it was decided to open offices at once in all the principal cities between Boston and Washington for the receipt and transmission of public messages. It is expected that business will be commenced within about a week, and that the company's lines to Chicago and other Western cities will be completed by Sept. 1. The line has been reported to be in good working order, and nothing remains to be done except the stringing of wires from the different offices selected to the main line. The Mutual Union has been conducting its work so as to attract as little attention as possible, and has completed its Washington-Boston line without becoming entangled in the network of law-suits which was thrown around the American Union in the days of its infancy. The progress of the new company through New Jersey—that battle-ground of competing telegraph interests—was accomplished, says the *American Exchange*, by the construction of lines by a local company, which subsequently sold out its rights and property to the Mutual Union. In this city peaceful entrance and establishment were secured by the making of a contract with the city authorities for the maintenance of the telegraph line of the municipal fire department at the expense of the Mutual Union, in return for the privilege allowed the company of placing its wires upon the department poles. In fact, the shrewdness, skill and effectiveness with which the Mutual Union has so far conducted its operations augurs well for the future development of its system, and the efficiency with which it will serve the public. By the first week of the present month it is expected that the company's lines will reach Buffalo and Pittsburgh, and by September it is hoped to have them extended to Chicago.

THE action of the Western Union in recognizing in a most substantial manner the willing earnestness in which its operators have responded to the extra call on their abilities consequent upon the attempted assassination of the President, should be warmly commended. We learn with pleasure that, during the past month, in the Chicago office, a number of \$70 men have had their salaries increased to \$80, in addition to all the operators there being paid double rates for extra services performed during the excitement and rush following the assault upon President Garfield. This action may well be held up to the managers of some other large offices, in at least one of which we will guarantee—if the General Manager will look into the matter—to point out where, by an extra expenditure of \$200 or \$300 per month in salaries, the business can be greatly increased and the public infinitely better served, all of which will ultimately be a "saving" to the company. As a matter of fact, every sensible manager knows that strictly first-class men cannot be had for \$75 per month, if indeed the supply can in any event meet the demand. Furthermore, the company can well afford to pay enough to secure good men, since, by its own reports, it appears that its receipts for July show an increase of a quarter of a million of dollars over the same month of last year, while in the New York office alone the number of messages per day has increased by 15,000. Some of our penny-wise superintendents may find food for profitable reflection in these figures, in connection with the just and timely action of the Chicago managers.

IN anticipation of the coming competition of the American Cable Company, the Anglo-American, the Direct United States, and the New French Cable companies reduce their rates to-day to one shilling (25 cents) per word. English, French and American Government messages will be transmitted at half rates, and press messages between 6 A. M. and noon, Greenwich time, sixpence (12½ cents) per word. This is a great change since the time when no message was sent for less than one hundred dollars, and it remains to be seen whether or not the change will be beneficial to the companies. A careful analysis of the business during the past eight years shows that when a charge of \$1.50 per word was made the average number of messages per day was 588, and the average daily receipts were \$12,000. At \$1 per word the number of messages per day was increased to 762, and the daily receipts were decreased to \$10,220. The charge of 75c. per word ran the number of messages up to 1,305, and the daily receipts down to \$9,550. The 50c. rate was worse, for with 917 messages per day the daily receipts were only \$5,915. The shilling or 25c. rate increased the number of messages per day to 1,678, but decreased the daily receipts to \$4,435. From this showing it seems clear that the 25c. rate has not paid in the past, and that for a long time to come the public will be the only gainer by this decrease in tariff.

THE Postal Telegraph Company, recently incorporated under New York laws, with a capital of \$21,000,000, completed its organization on the 22d ult., at the office of James R. Keene. The promoters of the enterprise are reticent in regard to the plans of the company; but it is understood that many leading capitalists and telegraph men are interested, and that within a short time the scheme will be launched under favorable auspices. The company claims to embrace all the modern improvements in telegraphy and wire, and by the new automatic system to be able to compete successfully with the present monopoly. It is stated that James R. Keene is to be President of the company. The Board of Directors will include John Mackey, of the Comstock lode, and other well-known California capitalists. George D. Roberts is also largely interested. The money, it is asserted, is already subscribed. The lines are to be constructed on a pure cash basis, and will be furnished with all the modern improvements. It is intended that it shall include every paying point covered by the Western Union line.

NEXT to the rapid growth of a young though vigorous opposition, that great telegraphic anachronism, the Western Union, is most threatened by a want of friendliness on the part of some of its present connecting systems. Foremost among these is the Baltimore & Ohio Railroad, the telegraphic system of which has always heretofore been placed at the conditional disposal of every corporation which, from time to time, has entered the field in opposition to the great Western Union monopoly. Everybody remembers the Aladdin-like change when the Western Union suddenly gave way on the Baltimore & Ohio, a short time ago, to the magical shield of the once glorious American Union. Since then new combinations have been made, but the Baltimore & Ohio has again shown a commendable desire to be free from any monopoly, and the ensuing controversy bids fair to result in the absolute and separate maintenance of the Balti-

more & Ohio lines as an opposition to the present Western Union organization.

IF Mr. Edison intends, as he now promises, to illuminate 500 houses in this city with his electric light by the 1st of October, the gas companies do not seem to be scared. It has been recently shown that New York now pays two and two-third times as much for gas as London, two and a-half times as much as Ghent, twice as much as Amsterdam, Berlin, or Brussels, and half as much again as Paris, Lyons, or Marseilles. While coal sells for five dollars a ton in London, and four dollars in Philadelphia, the price of gas in the latter city is three times what it is in London. Here, then, would seem to be a fine field for some acceptable substitute for gas, and yet Mr. Edison and his brother inventors do little more than talk.

FUN may occasionally be extracted from the dry files of the Patent Office. Looking over a package of old patent specifications, a few days ago, we came across one for an electro-magnetic dental instrument, the patentee of which bore the too suggestive name of "Yanker." The eternal fitness of things was never more clearly manifested. Similar to the above is a specimen taken from the last *Gazette*, in which a man named "Smokey" took out a patent for a new kind of suspended lamp. In the same issue a new jail or prison was patented and assigned to J. R. Ketcham. Verily, truth is stranger than fiction.

THE rapid growth of the telephone business has prompted some capitalists in France to start a new weekly paper in the interests of the telephone. The new paper is published in Paris, and is called *Le Telephone*. It is intended, apparently, to fill a place in French telegraphic literature which is so satisfactorily filled here by the "Telephone Department" in *THE OPERATOR*. While we doubt the wisdom, at present, of floating a paper devoted exclusively to telephony, its work, while it lasts, will be keenly appreciated, and we wish *The Telephone* all the success which it deserves.

THE meeting of the "Old-time Telegraphers" at Niagara Falls, on the 20th of next month, should be well attended, and, if we may judge from the re-union at Cincinnati last year, it will be a most enjoyable affair. We believe there was a balance of \$390 remaining after paying the expenses of that reunion, so that the committee now have a fair start in the matter of expenses.

THE proposal to locate the bullet in the President's body by means of Prof. Bell's improvement on the induction balance has every reasonable chance of success, and, if successful, will be a great triumph of electrical skill. There would seem to be no end to the uses to which the telephone may be applied.

THE Mutual Union all ready for business; another formidable opposition company with a capital of \$21,000,000, backed by well known capitalists and telegraph men; a disposition shown by the Western Union to increase salaries. The future for telegraphers does not look quite so unpromising as it did a few months ago.

OWING to a disappointment in receiving the biographical notes to accompany the portrait intended for this issue, we are compelled to postpone the publication of the portrait.

### Answers to Correspondents.

W. T. C. wants to know why his twenty-five mile telephone line often crackles so dreadfully and how the trouble can be remedied.

In an article on the "Enemies of the Telephone," by Mr. Lockwood, published in *THE OPERATOR* of Jan. 15, 1881, the subject is thoroughly canvassed. The nuisance is caused, under the conditions stated by our correspondent, by atmospheric and earth currents, which are usually at their height in the afternoon.

We recommend that W. T. C. change his ground connection at one or both ends of the line; that the ground connection be made as good as possible; that a careful lookout be kept for bad joints, and that no other wires be grounded on the same plates or pipes.

He might also try a shunt of high resistance branching to earth. If, for example, he could connect a wire having a resistance coil in circuit of 2,500 ohms permanently to the line, it would, very likely, relieve him of considerable of the trouble. The whole business of telephonic interfering troubles is still rather mysterious and its remedies very uncertain. Only experience can be depended upon for absolute relief in this matter.

WEB, Mercer, Pa.—Mr. J. B. Taltavall, of the New York Associated Press office, this city, is Secretary of the New York Telegraphers' Mutual Union.

SUBSCRIBER, Chicago.—The Blanchard Foods, referred to in last issue, are advertised in *THE OPERATOR*. Write to the company for a circular.

X., Lexington, Ky.—Books of instruction in stenography, or on any other subject, can be ordered of us, and will be mailed, postage prepaid, on receipt of regular publishers' price. It would be well for telegraphers to remember this. The price of Ben Pitman's system, bound in cloth is \$1.00; "American Manual of Phonography," with copying books, \$1; "Telegraphy," \$1.25; "Munson's Complete Phonography," \$2. The length of time required to learn altogether depends, as in telegraphy and everything else, upon the aptness of the learner and the amount of practice he gets. A few minutes a day, however, will soon make one a very fair stenographer.

Y., Augusta, Ga.—The re-issued Page patent covers broadly the combination of an electro-magnetic armature and adjustable retractor, as well as adjusting or regulating the vibrations of the armature of an electro-magnet by means of a set screw, "or any mechanical equivalent for substantially the same purpose." As these devices constitute an essential part of almost every telegraphic or electro-magnetic apparatus in existence, for whatever purpose it may be used, the re-issued patent, if valid, practically places the business of telegraphy in this country in the hands of the Western Union, of which company it is the property. The Western Union make a practice of bringing suits under the patent against every new telegraph company that starts, apparently for the purpose of worrying them, but the suits do not come to trial—for the reason, those who are unfriendly to the Western Union say, that the courts would not sustain the re-issued patent if it came before them properly defended.

THE message of the Chicago operators, congratulating the President upon his prospects of a speedy recovery, was an excellent and patriotic document.

## Students on the Erie.

To the Editor of The Operator:

SIR: Please allow me to call the attention of Supt. W. J. Holmes, of the Erie Railway, to the fact that there are on his division, between Utica and Corning, upward of a dozen offices where students are taken; one especially—that of Liberty—where the manager has built a line from the Western Union office around town, turning out five or six manipulators of the key yearly, for which I am informed he receives a handsome income. You will find students in nearly every office on this division. At Livonia, Savona and other places the operators have apparently gone into other business, as they are scarcely every heard on the wire, and men in this office are forced to repeat business three or four times and then they will very likely call you up for it again after it has been filed away.

I know these are strictly against Mr. Holmes' instructions, and that should he be aware of these facts, such a nuisance would not be allowed to exist.

BUFFALO, N. Y., July 16.

"REFORM."

## The Life of an Electric Lamp.

To the Editor of The Operator:

SIR: I notice an article in your last issue by W. H. Preece, on "Recent Advances in Electric Lighting." He says that Sir William Armstrong can only keep 37 lamps going, Lane Fox could only show 12 lights. Professor Adams could only produce from the most powerful dynamo-electric machine by calculation 140. It seems to me that if the dynamo-electric machines were multiplied on one conductor, with their poles properly arranged, this would solve the difficulty. That is to say, if 50 machines were placed on a conductor large enough, the result would be—taking the 100 light machine as a standard—that we would get 5,000 lights from it. If this holds good, then the only limit would be the power of the steam engine driving the machines and the size of the conductor. OLD LINER.

NEW YORK, July 18, 1881.

## TELEPHONE DEPARTMENT.

The Portland, Me., exchange is very highly spoken of by visitors. Mr. Farnham, the manager, is an excellent electrician.

No fewer than 30,185 of the Giltland magneto bells are now in use, 2,810 being shipped in July. These figures show their remarkable popularity.

Walter Norman is languishing in jail in this city for stealing thirty-six miles of telegraph wire, the property of the Metropolitan Telephone Company.

The Ypsilanti, Mich., exchange has 55 subscribers and will soon have a wire connecting it with the Ann Arbor exchange. Mr. Clark Cornwell is the manager.

A telephone cable was laid across the Hudson River at New Hamburg, July 23. Communication will thus be made between Newburg, Fishkill and other places.

The Topeka (Kan.) Telephone Exchange Company, Mr. E. L. Smith, Manager, is one of the best conducted in the West, and its patrons are universally satisfied with its working. It now has one hundred and sixty subscribers, and employs three operators, namely, Miss Libbie E. Duncan and Mr. Harry A. Smith, days, and Mr. Ed. P. Crawford, nights.

The cable of Mr. P. B. Delany, recommended in Mr. Pope's report read at the Chicago Convention for its simplicity and cheapness, has now been patented. The cable consists of a lead tube, flattened out and containing insulated wires inserted inside. In the manufacture the cable is passed between corrugated rollers, which press the lead close around the insulated wires. The lead tube is connected to the ground, and at junction the wires are crossed to avoid induction.

Mr. Eugene F. Phillips, of Providence, R. I., has issued invitations to his third annual social gathering of telephone and telegraph men, to partake of a Rhode Island clam dinner, on Saturday, August 6. These clam dinners have always been exceedingly enjoyable affairs, and will doubtless be no less so this year. The committee of arrangements are Messrs. J. W. Duxbury, Providence; H. B. Lytle, Boston; Henry W. Pope, New York, and Wm. H. Sawyer, Providence.

The proposition to establish telephonic communication with the bullet which has not yet been extracted from the President's body may please the scientists, but tender-hearted, unscientific men will regard it with positive horror. It is exasperating enough to talk through one of the things, when there is a sentient being at the other end of the wire; but to stand yelling "hello" to a bullet, and waiting for an answer, would be simply maddening. The President ought not to be subjected to any such intolerable anguish.—*Detroit Free Press.*

The Telephone Despatch Company, of Boston, has just tried an experiment in aerial lines which may be important in its results. A pipe of galvanized iron has been suspended from a strong strand, consisting of three large wires, for a long stretch of upward of 500 feet, and in it are to be placed about 150 covered copper wires. If the experiment proves successful, we may hope to be able to dispense with many of the wires that now radiate from the roof of every telephone office.

In connection with the rapid multiplication of Atlantic cables, it has been suggested that the cost of cabling may be reduced by adopting the use of the telephone. Certain experiments have already been made between France and England, with fairly satisfactory results. But any communication across the Atlantic is in the present state of science impossible. In cabling the opposition increases as the square of the distance, and the utmost that the cable between Europe and America can do is to give eight vibrations. A sound consisting of eight vibrations is inaudible, the faintest sound which the human ear can hear being one of sixteen vibrations when made in an organ pipe. Hence it appears that there is but little hope of reducing the cost of cabling by any use of the telephone.

Edison has great faith in the eventual success of long-distance telephoning, and expresses the belief that before many years have passed, a politician at Washington will be able to make a speech to an audience in Albany. It may be a long time before telephoning is brought to such perfection; but the world moves. Our grandfathers would have scouted the idea that we should ever read in our New York afternoon daily journals the same day's news from all parts of the Old World, flashed under the ocean through the cable. Who shall say that our great-grandchildren may not see the time when the American modistes will be inquiring from their Canton correspondents, through the telephone, the latest fashion in Chinese pigtails; and when the President of the United States, at Washington, will be enjoying a morning chat with his dear brother of all the Russias, at Constantinople?

A Frenchman has invented an ingenious method of keeping coffee at a proper temperature, it being well understood that over-heating spoils its aroma, while under-heating gives it a stale taste. The inventor immerses in the coffee a mercury thermometer, open above, and containing a float connected rigidly with a metallic needle, the other end of which moves on a dial. As the normal temperature of the coffee may vary between 85° and 90° C., the part of the dial between these terms is made of ebonite. Should the needle pass beyond them in either direction, electric contact is made and a bell is rung. In one case the heat requires to be intensified; in the other to be let down. The invention might be easily completed, says *L'Electricite*, by adapting an electro-magnet, which would close a gas-cock when there was too much heat and open it when not enough. A small jet might be kept constantly lit.

A new use has been found for the delicate sensibility of the telephone during the past week or two. In connection with an improved Hughes induction balance—a most delicate electrical instrument for detecting the presence of metals—it is proposed to employ it in locating the bullet in the body of President Garfield. This instrument consists of two short glass cylinders, around each of which are wound two parallel coils of fine insulated copper wire. One coil of each pair is included in a battery circuit, in which there is a clock-microphone. The other pair is placed in a closed circuit with a receiving telephone. The two glass cylinders with their incircling coils may be widely separated. The induction set up in the secondary or telephone circuit is balanced by the reversal of one of the secondary

coils and so adjusted that the induction in one of the secondary coils exactly balances or neutralizes the induction in the other, so that when the ear is applied to the receiving telephone no sound is heard. Now by placing ever so small a piece of metal in one of the glass cylinders, the electrical balance is disturbed and the clock on the microphone is heard to tick loudly, thus indicating the presence of metal.

The telephone was successfully worked last week between Buffalo, N. Y., and Paterson, N. J., a distance of 350 miles. The series of experiments made were conducted by Mr. J. F. Noonan, Paterson Manager Metropolitan Telephone and Telegraph Company, who claims to have discovered a method of adjusting batteries so as to produce good results in communicating over long distances. The Western Union lent a No. 6 wire between the two cities, and connection was made with the Central office in the Buffalo Exchange. Although the results of the test were not wholly satisfactory to Mr. Noonan, enough had been accomplished to show the value of his discoveries and to insure the possibility of long-distance telephoning. Listeners in the Buffalo Exchange could distinctly hear Mr. Noonan's "Halloa, Buffalo," and songs sung at Paterson were recognized at this end, of the line. In talking, the voice could be plainly heard, but the words could not be distinguished amid the heavy sputtering and snapping noises caused by induction from the wires. Telephone men feel confident that, if a wire can be obtained remote from the wires devoted to telegraph business, conversation can be easily carried on under Noonan's method. As it was, the results of the experiments are considered of great practical value.

## DASHES HERE AND THERE.

Western Union stock is quoted at 86 $\frac{1}{4}$ . Last issue it was 91 $\frac{3}{8}$ .

The first message sent over the new American cable was one of sympathy with Pres. Garfield.

Australia is to be divided into meteorological districts, so as to obtain the data for weather telegrams and warnings.

The July issue of the *Illustrated Scientific News* has several interesting illustrated articles, including one on the "Doble Telephone."

The German coal mines have commenced conveying coal to the pit's mouth by electric railways.

It is now four years since, July 30, 1877, the grand switch at 195 was burned, causing a temporary cessation of business.

The Aldermen refuse a permit to the Mutual Union Telegraph Company to set poles in Portsmouth, N. H.

Enterprise and energy climb the steep stairs to the pinnacle of success, while those who have worked for the American Union go up in an elevator.

Philadelphia and New York are connected by more telegraphic wires than any two other cities in the world, and yet all is not brotherly love between them.

Mr. Edison has also been unfortunate in another lawsuit, his appeal in the interference case Maxim vs. Edison, having been decided against him.

A powerful reason why we should all begin the study of electricity is, that in a short time it will surely lead us on to the electrode (elect road). This pun is not patented.

A correspondent in Walker, Tex., says: "For goodness sake, stop, to the best of your ability, the flow of operators to this State. Some of us will have to walk back if it continues."

People dread lightning more than they do intensely hot weather, yet in the United States on two days recently more people were fatally affected by sunstroke than have been killed in this country in five years by lightning.

There are jars enough, and with salt in battery, too, gracious knows, necessary to the proper working of telegraph lines, without the brethren and sistern adding anything thereto—let harmony, or more money, if possible, prevail.

He had come to the town to try and get a position. Seeing him hanging around the superin-

tendent's office, one of the operators asked him: "Have you seen the superintendent yet?" "No," he replied, quietly, "was he looking for me?"

M. Mascart, the head of the Meteorological Office in Paris, has constructed and distributed a set of forms to all the telegraph offices, with the sanction of the Minister of Postal Telegraphy, for recording the observations connected with thunder-storms.

Some gentlemen in London went to see the generator of the electric light. They were told to put aside their watches before they approached too near. This, it seems, was necessary, as otherwise the steel in the watches would have become polarized and the watches spoiled.

Nothing can be accomplished without hard study, and deep thought—unless you have some powerful friend to do the thoughtful for you; whatever ability, or the lack of it you possess, will then make itself readily apparent. Take a look around for confirmation of this.

Tim Lee Sing, a washerman, got a dispatch from Cincinnati, and sent his card back with the answer written thereon in a most superior style of penmanship and excellent Chinese. There is no doubt about the excellence of the Chinese. Every man in the office said it was by far the best Chinese he had ever read. Out of consideration for the Ohioans, however, it was not forwarded in that shape.

This is what the intelligent editor of one of the Atchison, Kan., dailies says concerning the telegraph: Sometimes the charge of battery must be so high that it makes the key hard to work, and in that event the operator gets fatigued in sending long messages, but as a general thing, when all the boys on the circuit are artists in their business, then it is fun. Every now and then some one "breaks in" to "get off" a joke, a yell of laughter flashes over the wires and the next is "go on" or "give us more."

In the Equity Court at Washington, on the 21st ult., Judge James delivered a long opinion in the case of Thomas A. Edison et al. vs. the Western Union Telegraph Company, for an injunction to prevent the company from infringing a patent of complainant for a system of quadruplex telegraphy. Judge James in his opinion sustained the plea of the Western Union Company—setting up in bar the pendency of a similar suit in the Circuit Court of the Southern District of New York—and dismissed the bill.

The reason why combinations against employers are almost invariably unsuccessful is because, while capital has a uniform easily recognized value, the value of each individual struggler will depend, to a large extent, on his natural ability, education and experience; also adaptability for the work engaged in. The only safe rule to go by in our business is to gauge each man at his own estimate of himself. Our well-known modesty will, of course, prevent the figures being put too high.

Information from Ottawa says that a telegraph line has been opened from one end of the Magdalen Island to the other, with six stations, three of them being signal stations. Three more telegraph stations will be opened before fall. The Anticosti land line, 200 miles in length, will be opened by the first of September with nine telegraph stations, four of which will also be signal stations. On the north of the St. Lawrence River the telegraph will be extended to Point Du Monts next year, and will reach Point Neuf Light-house this year. These telegraph and signal stations will be of great advantage to the fishing fleet.

The "Atlantic and Ohio Telegraph Company," the ghost of one of the Western Union's "dummies," went through the farce of an annual meeting, at Philadelphia, on the 21st ult. The following named persons were elected directors: Norvin Green, Augustus Schell, R. H. Rochester, Thomas T. Eckert, John B. Van Every, Henry Bentley, John E. Zeublin, Sylvester S. Garwood and William Carley. The officers elected were Norvin Green, President; Augustus Schell, Vice-President; R. H. Rochester, Secretary and Treasurer.

In Philadelphia the Underground Electric Telegraph Company will soon begin the work of laying telegraph and telephone wires upon Market street, from the Delaware River to the City Hall, on Broad street; also on Tenth and Third streets, to Chestnut. The wires will be laid in a

terra cotta pipe. The specifications given by the Highway Department for laying the pipe in the streets state that they must be in trenches two feet in width and from four to six feet in depth, and that not more than 200 feet of any street must be opened at the same time. Also that the work of laying the pipe must only take place between the hours of 6 P. M. and 7 o'clock in the morning.

The discovery of a portable electric force has caused a great flutter among the aeronauts. Some of them believe that here is discovered the means that shall make ballooning not only a fine art, but an every-day undertaking. It is believed that if a balloon can carry with it in portable shape a reserve force such as Sir William Thomson found in the famous box sent him from Paris, balloons can be fitted up with steering apparatus that will enable the aeronaut to control their passage through the air and go whithersoever he will, rather than whither the wind listeth. A meeting of the Aeronautical Society is to be held forthwith to discuss this new factor.—*London Letter to the Liverpool Post.*

The ubiquitous operator has been making trouble again—this time for a silly postmaster down in Alabama. The operator referred to, writing to the Post-Office Department, says: "The postmaster at this place has refused to forward, and is now holding, a postal card written by me on June 20, 1881. This card was directed very plainly on the address side and written in telegraphic characters, and was simply a business correspondence and very important. The postmaster claims that his authority for holding is that he is not permitted to forward any P. C. which he cannot read." The department sent a letter to the over-conscientious postmaster, with instructions to forward the postal card, and in the future not to be so zealous in the performance of his duty.

St. Paul was yesterday and last night as much isolated from the eastern part of the world as if telegraphic lines had never been heard of. A terrible storm in and about Chicago, and, as we'll as could be learned, extending into Wisconsin, spent, seemingly, a large part of its force in playing havoc with the wires, and, save a few moments yesterday morning, and again for a short time in the afternoon, communication was completely suspended. In Wisconsin a large tree fell directly upon one set of wires, severing them instantaneously. Private interests suffered considerably from the stoppage of telegraphic communication, and one instance is mentioned of a St. Paulite losing \$500 through his inability to notify eastern agents to complete a sale of grain.—*St. Paul (Minn.) Pioneer Press, July 22.*

On July 16 the telegraphers of Chicago sent the following telegram to Washington:

To Hon. Robert Lincoln, Secretary of War,

The Chicago telegraph operators, whose pleasing duty it was to flash to the remotest parts of the country the news of General Garfield's nomination—and who did their work so swiftly that before the official result of the ballot had been declared they had placed in his hands, on the floor of the convention hall, congratulatory messages from distant cities—acquired through their participation in these exciting scenes an interest in the President so warm that, more than others equally patriotic, they desire to convey to the President and his family assurances of their congratulations that so happy an outcome to so great a crime seems now assured, and their trust that the President will be speedily restored to health.

THE CHICAGO OPERATORS.

The San Francisco *Alta California* thus refers to the Chicago operators' telegram of sympathy with President Garfield:

"Clara Morris was a little cheeky in rushing to the front and telegraphing her regrets to Mrs. Garfield; but as actresses are expected to advertise themselves freely, people only smiled. The height of sympathetic grotesqueness is reached by the Chicago telegraph operators, who have thought it necessary to telegraph their sorrow to Washington, with the remarkable explanation that, having telegraphed his nomination all over the country at the time of the National Convention, 'they acquired, through their participation in those scenes, an interest in the President so warm that, more than others equally patriotic, they desire to convey,' etc., etc. Sublime self-conceit of the most diminutive molecules. Next we shall have the corn doctors and

the barbers uniting to testify the unusual depth of their grief, owing to their close personal relations to the distinguished sufferer, having actually rubbed his head and soothed his bunions."

An exchange says: The Sioux and Cheyennes have always been very superstitious about "talking wire," as they call it, and for several years after the Indian war broke out refrained from meddling with the overland line. In order to impress the minds of these wild beings with the mysterious power of the telegraph, a great council was called at Scott's Bluffs, when the line was first built. Two of the great chiefs were stationed at posts in the open plain, between the Chimney Rock and Scott's Bluff, and each sent messages through telegraph operators, which were promptly delivered. Then the chiefs mounted their fastest horses and galloped to meet each other, and asked what the messages were or the words he had spoken to the wire. The result astounded them. They could not explain it, nor has it ever been understood by them, and to this day a telegraph operator or man engaged in the repair or management of the "talking wire" is regarded as a "medicine man" and a person to be let alone. It was to this superstition that Creighton's thirty men owed their lives and exemption from attack.

In our last issue mention was made of the great opposition in Montreal to the proposition to allow the Montreal Telegraph Company to pass into the control of Jay Gould and the Western Union Company. The proposition of Mr. Gould was that the Dominion Telegraph Company, now leased to the Western Union, and the Montreal Company should amalgamate and be leased to the Great Northwestern, whose directors should guarantee the Montreal shareholders eight and the Dominion shareholders six per cent. per annum. On the 16th ult., an application for an injunction to prevent the meeting of the shareholders of the Montreal Telegraph Company was not granted, so far as the meeting was concerned, but an order was issued to restrain the officers from executing the proposed contract until a further hearing could be had. The meeting of shareholders was therefore held, and a resolution was unanimously passed in favor of accepting the proposals made for working the lines of the Montreal company by the Great Northwestern company under a guarantee of the Western Union company.

When advanced thinkers and writers are devoting considerable time to a rearrangement of our present incongruous system of spelling, perhaps it will not be well to be too severe on those who show such originality of thought, as appears from the following:

This gentleman sent his message to "peat mccooy," tacked an extra e to "Hee," and signed himself "james." The next one was financially afflicted, and made his want known by the characteristic request: "i neade muny at once." Another one was a pronounced politician, and imparted the information that the "Constunel Amends" had been passed.

It might be surmised here that possibly he himself had assisted at the passing of one or more of the Constitutionals. As an offset to the above, however, it may be mentioned that two respected members of the fraternity showed what they could do in this line, by transforming Alfred Harris into A. J. Red Harris, and that gentleman, it may be added, did his level best to acknowledge their attentions by a Harrising pursuit.

## NEW YORK CITY ITEMS.

Mr. W. W. Mead, night manager A. U. office, this city, has resigned, to finish his studies for the ministry. Mr. W. C. Pearse has been appointed his successor, and Mr. R. C. Edwards succeeds Mr. Pearse as late night chief.

The Western Union, the American Union and Atlantic & Pacific telegraph companies, the Gold and Stock Telegraph Company and the Manhattan Quotation Company have obtained writs of certiorari to review the action of the tax commissioners in their assessment in regard to the individual companies.

During the thunder-storm on the 13th ult., one of the large elm trees standing on the Bat-

tery sidewalk was struck by lightning, which cut off several branches, barked its trunk, and then leaving reached the telegraph wire attached to the United States barge office, No. 6 State street, crossed the street upon it, doing no other damage than that of cutting the wire off at its entrance to the office. Under the tree stood several teams and trucks which, doubtless, would have suffered had it not been for the wire.

The Central Construction Company of New York was organized to erect poles and string wires for the American Union Telegraph Company. When the latter company sold its plant, etc., to the Western Union, no reason remained for the continued existence of the Central Construction Company. James Owen, Joseph Owen, and Amos H. Calef, a majority of its trustees, have applied to the Supreme Court for an order dissolving it. In their petition they say that the company has no debts and no unsatisfied engagements. Its capital stock is \$5,000, divided into 100 shares of \$50 each. Of these shares only 54 have been issued, and their holders are the petitioners, with Washington E. Conners and G. P. Morosini. Judge Cullen, holding Supreme Court, Chambers, has appointed Mr. Willard Bartlett as referee to take testimony in the matter of the petition.

### PERSONAL.

Supt. Frank Bell, of Reno, Nev., has resigned. C. E. Hubon is assistant manager at San Diego, Cal.

Messrs. Howell and Ward have arrived on the Pacific coast from the East and are both doing extra duty in San Francisco.

Mr. Charles Selden, formerly A. U. Supt. at Toledo, O., has been appointed Supt. of Telegraph on Jay Gould's Wabash system.

Mr. John Thomson, clerk to Supt. Meriwether, Mobile, Ala., resigned, July 1st, to go to the City of Mexico. Mr. B. P. Shreve, of Montgomery, fills the vacancy.

Tucson, Ariz., office has received an addition to its force in the person of Mr. J. F. Lewis. Tucson does a heavy business and keeps the wires equal to the weather—very hot.

Mr. J. C. Sherer, chief operator at Los Angeles, Cal., is East on a four months' leave of absence. Mr. Worthington, of San Francisco, takes Mr. Sherer's place.

Mr. Bell, operator at Tombstone, Ariz., has resigned and accepted a position in the telegraph office of the Oregon Steamship Navigation Co., at Portland, Oregon. Mr. Santler, from San Francisco, fills the vacancy.

Mr. Micha P. Austin, one of the oldest telegraphers in the East, and for twelve years night manager of the Western Union Telegraph office in Portland, Me., died in Cherryfield on the 16th ult.

Miss Minnie Reeve, telegraph operator and agent of the Minneapolis & St. Louis Railroad at Hopkins, Minn., was killed July 26 by a collision between an empty train and a locomotive on which she was riding. She was terribly crushed and scalded.

Charles A. Tinker, Superintendent of the B. & O. R. R. Telegraph Department, has resigned. It is probable that Mr. Tinker will be appointed a general superintendent of the Western Union. Mr. Robert Stewart, it is thought, will be his successor on the B. & O.

Supt. R. B. Haines and Manager G. Q. Stewart, of Los Angeles, Cal., have resigned. Mr. Haines now fills the position of Manager. A presentation consisting of a set of Macauley's "History of England" and a handsome gold pen was made to Manager Stewart before his departure.

During a storm at Evansville, Wis., on the 20th ult., the night telegraph operator, Hensgler, was struck by lightning and killed. It is supposed that his foot was resting on a ground wire under the table. He was struck near the heart, the charge passing out of his left heel.

Mr. Geo. W. La Rue, of Springfield, O., to-day enters upon the duties of superintendent for the Mutual Union Telegraph Company. Mr. La Rue is well known throughout the West, and his many friends will be glad to hear of his preferment. Mr. Geo. C. Van Cleef is his successor at Springfield.

It is pleasant to notice that the efforts of at least one operator to furnish information to the public during the excitement following the attempted assassination of President Garfield have been appreciated. Miss Clara Brown, operator at Tarrytown, N. Y., recently received a handsome present from her friends, in recognition of the manner in which she had during the week met the eager inquiries of persons seeking for the latest news concerning the President.

Mr. James S. Rice, P. R. & P. operator at Lebanon, Pa., died at that place July 12th, of consumption, aged 23 years. Mr. Rice was so much thought of that when he became so ill that he had to resign the company would not accept his resignation, but allowed him a two months' leave of absence with full pay, in the hope that he would recover his health—an example, by the way, which other companies might occasionally follow, in the case of faithful employés.

Mr. J. C. Hueston, London agent of the New York Associated Press, and an old operator well known in this country, had a narrow escape from drowning recently in what proved to be a successful effort at saving human life. While at Ems, on his vacation, and walking with his daughter across a bridge over the river Lahn, he noticed a drowning woman in the stream. The bystanders stood listlessly upon the bank, making no attempt at her rescue. As he saw her go under Mr. Hueston instantly plunged into the stream, without divesting himself of any of his clothing, and finally reached the shore in safety with his unconscious burden. The rescued lady proved to be a patient in a neighboring hospital, from which she had wandered in delirium.

CHARLESTON, S. C.—The only matter of interest here is the constant accession of members to the Telegraphers' Mutual Union. Matters are generally flourishing in Union affairs. We also have an employment bureau of our own, and are always ready to look out for any members wanting employment. There is considerable dissatisfaction displayed by Western Union men on account of the last cut in salaries and force. They are only waiting for something better to turn up, and as all wish to get out of a business where there is so little encouragement to remain, the time may come when good men will be impossible to obtain, and the policy of the company will bear the fruit of which they have sown the seed. TRUTH.

Messrs. R. J. Broderick, J. S. Butterfield, H. Bohanan and C. A. Durlan, operators in the Decatur Ill., office of the Wabash, St. L. & P. Ry., resigned their positions in a body July 1st, on being notified that their salaries were to be reduced from \$5 to \$10 each per month. The day operators only received \$60 a month, and the night men \$50 and \$55 respectively. They therefore, considered the reduction an unjust one, and claim that the arduous work they performed merited even better pay than they have been receiving. They are highly recommended by Yardmaster Hartman as careful, sober and reliable operators. They are men of sand, and will probably start for the far West in a few days. The reduction is made, it is claimed, that the wages of operators in small towns may be increased, without extra expense to the company.

The following are the dispatchers at Antonito, Col., for the San Juan Division of D. & R. G. Ry.: Messrs. Jas. A. Rasbach, O. A. Slocum, and Geo. A. Loasby, with Eugene Wadhams as W. U. operator.

Mr. George H. Hulbert, train dispatcher for the N. & C. R. R., Chattanooga, Tenn., died in that city July 6, aged 38 years. Mr. Hulbert was for a long time connected with the A. & P. in New York as operator and night manager, at 198 Broadway, and was well known in this city.

Mr. John E. Tierney, assistant electrician of the Bell Telephone Company, Portland, Me., has been transferred to take charge of the exchange at Old Orchard Beach, Me.

Mr. A. C. Preble, formerly manager of the Portland, Me., A. U. office, has charge of the W. U. office at Old Orchard Beach, Me.

### MARRIED.

ODENWELDER—HERBST.—July 21, at Ocean Grove, N. J., by Rev. S. C. Breyfogel, of Philadelphia, John M. Odenwelder, operator dis-

patchers office, C. R. R., of N. J., Phillipsburg, N. J., to Miss Cora O. Herbst, of Easton, Pa.

### DIED.

KNAPP.—July 5, 1881, at Indianola, Ia., Albert D. Knapp, of the A. U. force, Burlington, Ia., aged 20 years.

LABONTE.—July 26, 1881, in Brooklyn N. Y., Joseph Labonté, formerly of St. Hyacinthe, Canada, aged 38 years.

OZIAS.—July 16, at Arcanum, Ohio, of sunstroke, Benjamin F. Ozias, agent D. & U. R. R. and manager W. U. telegraph office, aged 43 years.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

### SIMPLICITY AND EFFICIENCY

## In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

### Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

112 Liberty Street, New York.

## THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.

- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the

**LAW TELEGRAPH COMPANY,**

140 FULTON STREET, NEW YORK.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

## District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

## PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

# The Cumming Periphery-Contact Telegraph Key.

NO JAR OR STICKING POINTS.

RETAIL PRICE,  
\$4.40.

BY MAIL.  
REGISTERED,  
\$4.65.

(PATENT APPLIED FOR.)

MR. GEORGE CUMMING, a New York telegrapher, having long realized the irksomeness of the keys in general use, and their tendency, by the severe tension of the nerves, to cause paralysis, claims that his new principle, periphery-contact, obviates these serious evils; the key being absolutely free from "sticking," or adherence of points, without jar, and giving a more rapid and delicate transmission than any other. The device consists in the placing of two wheels or discs swinging one upon the other, at right angles; one disc inside the arch of the lever and the other crosswise in the insulated standard. The electrical contact is attained on the rims or tires of these platina discs, instead of by the two wire points in general use for telegraph keys. These said discs are capable of a thousand surfaces by adjustment. The wheels are firmly held in place by small set screws working on the axles of the same.

## ADVANTAGES CLAIMED.

**FIRST.**—The least possible contact surface—a mere geometrical point—which produces perfect electrical connection: The two discs being placed at right angles to each other, the connection between the two is only a needle point of surface. At the same time the signals are given with great precision and delicacy of stroke. We would here say that the needle point of surface has now been decided by many experts to be the scientific explanation for its properties as a non-sticking key. The infinitesimal surface of the peripheric contact at right angles as a conveyor of electricity, has not hitherto been discerned or adopted till discovered by the inventor of this key.

**SECOND.**—Circular surface of the rim: Thus preventing dust from accumulating easily at the point of contact and breaking circuit.

**THIRD.**—Adjustability of the electrodes: For, if through any unforeseen accident connection should be arrested, both wheels, having a thousand possible points of contact, can be changed in an instant by turning each slightly on its axis to a new and bright surface.

**FOURTH.**—No lateral motion: The electrodes connect firmly and perfectly, so that the trunnion can be screwed tight without affecting the correct working of the key.

**FIFTH.**—Close contact: For the same reason the contact can be so regulated, if desired, that no lost vertical motion need be perceptible, thus giving a soft, velvet stroke.

**SIXTH.**—No jar: The system of wheels and axles forms an elastic bed, which, taken in connection with the dot-contact and close adjustment, makes it possible to work the key all day without any lost motion to fatigue the hand or try the nerves.

This key has had unusual tests and has come out of the trial victorious. It is at present being worked on the heaviest wires with thorough satisfaction. We have received the highest testimonials from the profession as to its good qualities, viz., non-sticking, elastic stroke, lack of jar, and beauty of construction.

One of the finest operators in the service says: "Too much praise cannot be given to the Cumming key. I endorse all that anyone can say in its favor." Another: "It is only a question of time before its adoption becomes universal." Another, an inventor and expert, says: "I consider the Cumming key far superior to all others, it does not stick."

Every operator who has handled the Cumming key pronounces it "a treasure" and capable of giving the fastest transmission under the strongest battery, and any company who has had to pay for the many blunders caused by sticking keys can but echo that refrain—a treasure—if they adopt it.

Sample key sent post-paid on receipt of price.

GENERAL AGENTS,

MANUFACTURERS AND DEALERS IN

Telegraph and Telephone Machinery and Supplies of Every Description  
5 and 7 Dev Street, New York.

# A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## THE ELECTRICAL EXHIBITION.

[By Cable and Mail from our Special Correspondent.]

Owing to many of the exhibits not being ready, the opening of the International Exhibition of Electricity, at Paris, was postponed from August 1st, to Thursday last, the 11th. At eleven o'clock on Wednesday morning, the Exhibition was formally opened by President Grévy, who passed the exhibits rapidly in review. Mr. Morton, the American Ambassador, received President Grévy at the United States section. On Thursday, the 11th, the exhibition was thrown open to the public. But few of the exhibits are in a condition for a public opening of the exhibition. The German department is not much more advanced than the American, notwithstanding the former did not have to encounter the delays of along sea transit.

The exhibition promises to be a much grander affair than was at first anticipated, and the extension of time in opening was necessary to enable the exhibitors to get their goods ready. At present the Palais de l'Industrie is a perfect beehive. Small buildings are going up in every direction, linemen are running wires, mechanics are setting up engines, carpenters are busy with hammer and saw, and those in the building who are not doing actual physical work are swearing at those who are. No one who has had experience with a French carpenter will be surprised to hear that much urging and profanity on the part of the unchristian exhibitor is necessary to get anything done. The Americans complain much of the fearful unreliability of French workmen, who seem to have no idea of the value of time. Notwithstanding the short time and the need for haste, these workmen must have an hour for breakfast at eleven o'clock, and another hour's rest at three, when they can be seen lying around the building indulging in their afternoon siesta. The arrangements are, however, gradually assuming shape, and an idea can be formed of what the show will look like when it is properly under headway.

All of the known electric light companies are here in force, with Edison's light, of course, attracting most attention. Edison has arranged light the grand staircase of the Palais during the exhibition.

His display promises, when completed, to be one of the most popular in the exhibition. By Sunday night 500 Edison lights will be burning in a room on the first floor especially fitted up for them. His agent intends, if

possible, to obtain the loan of wires connecting the French section with the Théâtre Français and the Opera. He claims that he will be able to make performances audible to a large audience by telephone. It is also promised that, by an automatic system exhibited in Edison's section, four operators will be able to telegraph 1,200 words per minute.

The American telephone people also present a strong front, and will have some very interesting exhibits. They did not unpack their instruments until just before the opening, fearing the effect of the clouds of dust that fill the place while the workmen have control.

Those of your New York readers who attended Supt. Scott's lecture before the Electrical Society, last spring, will be interested to know that the original Wheatstone bridge is shown as part of King's College exhibit. Mr. Latimer Clark contributes some old and rare books, and it is supposed that every important work published relating to the history and development of the telegraph is among them. In one of these works, the *Magie Natureles* of Baptista Porta, Naples, 1558, is a curious forecast of the magnetic telegraph, which describes a method of communicating at a distance with the aid of two ordinary compasses. One of the most imposing exhibits is that of the Siemens Brothers, in which is a model of the steamer Faraday, now engaged in laying the last of the new American cables.

England and Germany occupy the most space of the foreign countries represented. Next in order in size come Belgium and America. The electric railway is almost finished, but is not yet in working order. The ingenious electric boat of M. Trouvé, and the so-called Tissandier balloon were, however, ready for exhibition, and attracted a great deal of attention, as did also Faure's electric accumulator, by which electricity may be stored. The German section is principally devoted to the application of electricity to military and scholastic purposes. The English government exhibits are mostly of historical interest, and consist of all instruments used since 1837.

Some of our people who have to use any quantity of battery for their exhibits, and came expecting to find the material here, have had cause to regret their faith in French business principles. One exhibitor wanted 100 cells of ordinary Callaud battery, and was recommended to the largest dealers in telegraphic material in Paris. There he found nearly what he wanted, but the firm actually did not have as many as 100 cells of any

one kind of battery in stock. They could have them made, but required eight days to fill the order. The difficulty was finally overcome by sending the order to Berlin by telegraph, and having it filled in five days.

## LIGHTNING.

### Its Action upon Telephone Apparatus—How to Prevent or Reduce Troubles Arising Therefrom.

In these days of popular science, every one knows that lightning is the discharge of atmospheric electricity, and that it seeks, under all circumstances, the easiest and shortest road to the earth. The wide range of usefulness which the telephone has taken upon itself brings the subject of the present article home to every telephone manager and even to every telephone user. It cannot be denied that the majority of the latter class have a vivid impression that wires of any kind on a house make that house very liable to a lightning stroke, and that telegraph or telephone wires are especially subject to such a drawback.

Many people who would otherwise rent and use a telephone are by this apprehension debarred from that privilege; or, if they have one, they live in a state of chronic disquietude, arising from the thought that they are harboring a destroying angel, as it were, who at any time may turn and rend them.

This apprehension is well known by practical electricians to be to a great extent without legitimate foundation; but, nevertheless, it prevails and cannot be overlooked. Only those miserable and unfortunate persons whose terrible doom it has been to solicit roof permits from householders can appreciate the sentiment in all its glaring force. The proposal to establish a fixture upon the roof belonging to a free-born American citizen usually calls forth very severe objurgations upon the bloated corporations in the person of their unoffending agent then present. The assertion uniformly made by the agent, that the wires running over a house are absolutely a protection, instead of dangerous, is treated by the American citizen with undisguised scorn, as advanced by an interested party. The American citizen cannot be so easily imposed upon. He has never seen any one killed by electricity, but he has heard that such things are possible; therefore he has no desire to have wires worked by electricity placed on the top of his house. He has been told that a wire leading from the top of a house attracts lightning. What can be more

logical than that a wire running over your roof will also attract lightning, and, of course, after having attracted the lightning to the house, the death-dealing and treacherous wire has done its work because, as the wire does not run down the wall into the ground, the lightning must necessarily go through the house, in its endeavor to reach the earth.

Such are the arguments of the free-born citizen, when he condescends to argue at all.

The wires must, however, be stretched, and in fact always are stretched.

It is a fact also that where there are a sufficient number of wires crossing any roof, they form practically a much more reliable safeguard against destruction from lightning discharges than do fifty per cent. of the lightning rods, since they must in order to perform their legitimate functions satisfactorily form a good connection with the ground, in at least one of their terminals. Even when but a few wires cross a roof they protect that roof to a considerable extent. That property is protected by the wires passing over it, needs no other proof than the fact that the lower part of New York, which is literally covered by a network of wires, has for many years possessed almost perfect immunity from lightning casualties.

This immunity to the property under and surrounding the wires is, unfortunately, in a great measure at the expense of the wires themselves, or of the fixtures, poles or electrical apparatus, as has been frequently proven by disastrous experience. During the present summer, the fatality has been unusually great among the coils of magneto bells, telephones and Blake transmitters. A certain amount of such trouble and annoyance must always be expected and counted upon, as one of the inherent features of the business.

To enable amateur telephonists and others who have been brought by the force of circumstances into the telephone business to reduce this loss and annoyance to a minimum, this article is written.

Telephone lines when properly constructed are not so liable to damage from lightning as telegraph lines, for the common-sense reason that they do not usually extend over anything like so large a section of territory. Lightning will take the shortest path to the earth, even though that path be of much greater resistance than the longer route; hence, it has been found possible to construct lightning arresters or protectors.

Lightning is neither restricted to the properties of machine or frictional electricity, nor to those of galvanic electricity, but partakes of the nature of both, being possessed of high potential in addition to being present in large quantity.

This latter is, of course, due to the electromotive force with which it is propelled being so enormously great in proportion to the resistance which the discharge has to pass through, even though that discharge be also great.

Being of such a high potential, or having such a high tension, as is demonstrated by its capability of passing through such wonderful distances of air as it does, it follows that we can construct a protector based upon the principle previously enunciated, that lightning will take a short route through the imperfect conductor in preference to a longer one through a good conductor.

Telephone managers, then, who have erected upon their lines the so-called induction appliances, consisting of ground wires extending down the poles and branch wires along the cross arms, can console their wounded pocket books with the reflection that, even should these appliances prove ineffectual for the purpose for which they were erected, with a slight alteration (namely, continuing the connection of the cross-arm wire up to a point outside though not touching the insulator and facing the wire, and extending the upright pole wire a little distance above the top

of the pole) a reliable lightning conductor is established and the poles and wire protected.

Even in their present condition they do efficient service. Each magnet bell is or should be furnished with a lightning arrester of some kind, usually a plate connected with each entering wire placed close on either side of a plate with saw-like teeth which is connected to the ground.

Any one wishing additional security may add to this different forms of protector. For instance, it may be of use to place near the point where the wires enter the office a cylindrical piece of brass connected to the ground, and insert in the line circuit on both entering wires a piece of fine silk covered wire. The lightning, in this case, instead of passing through the magnet or transmitter coils will go to earth at the metallic cylinder. There is, however, a serious objection to all protectors of this class, especially when at a distance from the central office, for the reason that when a discharge takes place through them they are more than likely to be ruined. On this account we give some precautions which every telephone constructor can employ with great advantage and at little or no additional cost.

First, owing to the second attribute of electricity (its considerable quantity), it will heat, sometimes to the melting point, and destroy the wire, unless its conducting path be large enough and the ground wire be both low in resistance and of considerable size; and it will also, in its attempt to choose another route to the earth, be likely to destroy a good deal of the apparatus, burning and melting the metal parts, and breaking to pieces all the non-conducting portions.

It is the part of wisdom then with all those who deplore such wholesale destruction of property to see that they have a ground wire of large substance and also surface, and that such a ground wire makes a perfect connection with the ground. In a former article we gave our views on ground wires and will not repeat them here. It is not, however, as well understood as it should be that a lightning arrester ground, whether at a central office or at a subscriber's office, in order to be of any practical utility, must be of large size and, moreover, its connections must be of large surface and thoroughly attached. For size we would say not less than five-sixteenths of an inch, iron or copper wire. The connection may properly be made on a water or gas pipe as usual; but if a gas pipe is used and the connection made on the house side of the meter, the meter should invariably be bridged with a stout piece of copper wire, to improve the conductivity and also to prevent the meter from receiving damage.

The older magneto-bells had but one binding screw for their local battery connection, and it was customary for the individual connecting them to connect the other battery wire into one of the main line connection screws. This, of course, left one end of the primary coil of the transmitter always in connection with the line, and in the event of the line receiving a lightning discharge a portion of it would frequently seek earth through the primary coil and across to the secondary, burning both out in transit. Therefore, if you have to connect a bell with but one local battery screw, don't connect the other battery wire in the line post, but in the upper telephone connecting screw on the right hand side of the bell. Bells are now made with binding screws for all the necessary wires.

Some exchanges have been fitted with protective appliances to be attached to their line wires on the approach of a lightning storm.

The contrivances are especially applicable to small exchanges, where all the wires can be easily controlled by one person, but they are readily modified so that they can be applied to exchanges of any size.

The contrivance consists, generally, in so arranging the apparatus that on the approach of a thunder-storm all the lines are put directly to earth. A brass plate is arranged behind the switch-board, crossing all the wires; this plate is fixed upon pivots, and is in permanent connection with a very large ground wire. On the approach of a storm a lever attached to the plate is depressed, bringing the plate into good contact with all the line wires, or with a series of small plates connected to them, at a point before the line wires reach the annunciators.

This, of course, puts them all to ground and it is found that wherever this arrangement is used the destruction of bells and transmitter coils is materially lessened.

### Telephone and Telegraph Clam Dinner.

In the summer of 1879, Mr. Eugene F. Phillips, the well-known manufacturer of insulated telegraph and telephone wire, sent invitations to his customers to come to Providence and partake of a Rhode Island clam-bake with him. The affair was so successful, and those who went enjoyed themselves so well, that Mr. Phillips has continued the commendable practice every year since.

The third annual "social gathering of telephone and telegraph men," as the notes of invitation call it, took place on Saturday, Aug. 6, and was the most largely attended of any yet held, about 60 representative telephone and telegraph men being present.

As delegates arrived they reported at the telephone exchange. About noon they all repaired to Mr. Phillips' handsome residence on Broad street, whence they proceeded in a large party wagon, drawn by six plumed and prancing horses, to the headquarters of the Bondholders' Club, a fairy-like retreat on the Pawtuxet River. The whole party at once began to enjoy themselves in the manner which seemed best in their own individual eyes. Foot-ball, leap-frog, baseball, playing tag, and like sports, were indulged in, until those who yesterday had been the dignified officials of telephone and telegraph companies, and the like, were now transformed in a twinkling into frolicking schoolboys, enjoying their recess games. The gentleman who remarked, with an exuberance of feeling that was unmistakable, that he had not felt so much like a boy before in fifteen years, doubtless uttered the sentiment uppermost in every mind.

Presently Mr. H. C. Bradford, late manager of the Providence Western Union office, called the company to order, and introduced ex-Mayor Doyle, who, in behalf of Mr. Phillips, welcomed those present to Rhode Island, and invited them to the tables to partake of a luncheon, consisting of clam chowder, clam cakes and relishes, the clam-bake coming later. After devoting a proper amount of time and attention to the luncheon, sports and games were renewed with unabated vigor.

Adjutant General Barney, manager of the Inter-State Telephone Co., Providence, and Mr. Henry W. Pope, Vice-President of the Mutual Union Telegraph Co., New York, superintended the target shooting. The entrance fee was ten cents, and the winner got the pool. The entries were large, and much interest was displayed. Mr. Pope sustained the reputation of the metropolis by carrying off the honors and the dimes in one pool, while Mr. J. F. Shorey, of Boston, won another, making the best score of the day.

Among the outdoor sports the wheelbarrow races occasioned the most fun. Two blindfolded contestants with their backs to the goal—a pitchfork fifty feet away—each took a wheelbarrow, turned around and tried how near he could come to striking the stake. Few of them went in the direction of the pitchfork at all, and those who did generally managed to get a considerable distance past it, finally taking off the bandage from their eyes, looking sheepish and discouraged, amid a burst of laughter from the crowd.

Mr. M. W. Goodyear, of New York, representing the house of L. G. Tillotson & Co., and Mr. H. L. Shippy, also of this city, representing the John A. Roebling's Sons Company, indulged in friendly rivalry with the wheelbarrows. Had it not been for a fence which marks the outside limit of the bondholders' grounds, some distance from the stake, it is thought by some that Mr. Shippy would not have halted until he had reached Connecticut soil. The route he took, too, after turning around, instead of going straight ahead, was in a comparative bee-line to his right. Mr. Goodyear sped along at a brisk rate in the direction diametrically opposite to that Mr. Shippy had chosen, and finally put down the wheelbarrow, amid uproarious laughter all along the line, at a distance estimated to be about two hundred feet from the stake, though it is only fair to Mr. Goodyear to say that nobody measured it.

Mr. George F. Truell, Special Agent Mutual District Telegraph Co., New York, was the only one who struck the stake. He carried off one of the pools.

Mr. L. N. Downs, of Worcester, managed to come pretty close to it, and, notwithstanding the protests of his competitors that he "could see" and that Mr. J. C. Sheehan, W. U. manager at Providence, had coached him, he was awarded the other pool. A barrow race up and down hill, between Mr. E. S. Beckford, of Boston, and Mr. Downs, was much enjoyed; Mr. Beckford being tall and slim, and Mr. Downs short and stout. The former won.

There was a boat race on the Pawtuxet. The rowing was done in pairs, the winners to row a final race. Messrs. W. A. Hall, of Boston; A. C. White, of Providence, manager of the telephone exchange, and L. N. Downs, rowed in the final race, Mr. Hall coming in ahead.

About four o'clock the clam-bake, with water-melon and other dessert, was served in excellent style, and as most of the party had whetted their appetites in their efforts to enjoy themselves, ample justice was done the meal.

After dinner, the time was principally spent in singing, recitations and story telling, a Mr. Levi Burdon, of Providence, keeping the company in an almost continuous roar of laughter at his inimitable anecdotes. Mr. Burdon not being connected with the business, the stories were not of a telegraphic or telephonic character, but they were excellently told and warmly applauded. A visit to the Park Garden to see "Olivette" concluded the programme, though a few of those from a distance, including the New York delegation, remained in Providence all night, and spent Sunday at Newport. Throughout the day not a single incident occurred to mar the pleasure of the occasion, and every one seemed to enjoy himself to his utmost capacity.

The following were present:

BOSTON.—Moses G. Crane, W. A. Hall, F. E. Harris, Jos. W. Stover, Chas. Williams, Jr., J. F. Shorey, E. S. Beckford, George W. Boston, T. D. Lockwood, H. B. Lytle, George Willis Pierce, N. W. Lillie, W. D. McKenny, J. H. Cheever, Wm. B. Ross.

NEW YORK.—M. W. Goodyear, H. G. Runkel, I. A. Sherman, C. B. Hotchkiss, Isaac Davis, E. M. Carhart, William Mackintosh, H. W. Pope, George F. Truell, Charles H. Porter, W. J. Johnston, H. L. Shipley.

PROVIDENCE.—H. C. Bradford, F. H. Gardiner, E. C. Spink, W. H. Darling, C. H. Barney, Augustus Wright, Reginald C. Brown, Henry H. Sherman, J. O. Darling, Thos. L. Reed, W. H. Sawyer, A. C. White, Abiel F. Davis, G. W. Zanson, Walter S. Goff, C. J. Sheehan, Edwin A. Smith, Geo. H. Albee, P. J. Hurlburt, E. F. Phillips.

Also Robt. D. Mason, of Pawtucket; Wm. M. Whitney, of Albany; Geo. H. Bliss, of Pittsfield; J. A. McCoy, of Fall River; W. J. Denver, of Springfield; J. H. Lounsbury, of Hartford; E. B. Baker, of New Haven; L. N. Downs, of Worcester; E. J. Hall, Jr., of Buffalo; Schuyler Walden, of Brooklyn.

The following, among others, sent regrets at their inability to be present: H. G. Pierson, A. S. Dodd, F. L. Pope, R. W. Pope, J. H. Bunnell, A. S. Downer, A. B. Chandler, J. C. Hinchman, G. A. Hamilton, J. H. Longstreet, E. W. Andrews, and Gerritt Smith, of New York; W. H. Forbes, Boston; F. O. Vaille, Denver; W. D. Sargent, Philadelphia, and Geo. F. Durant, St. Louis.

#### Retirement of a Well-Known Journalist.

Mr. James W. Simonton, who has occupied the position of General Agent of the New York Associated Press for the past fourteen years, tendered his resignation July 27, and Mr. James C. Hueston, at present the London agent of the association, has been appointed to succeed him. Desire to attend to his private business was the main cause of Mr. Simonton severing his connection, and the association, in accepting his resignation, at a full meeting authorized the Executive Committee to express their appreciation of his services in the following communication:

NEW YORK, July 27, 1881.—The Executive

Committee of the Associated Press, to whom was intrusted the duty of preparing the expression of opinion of the association in regard to the voluntary retirement of James W. Simonton as General Agent of the association report as follows: That Mr. Simonton has been the General Agent of the association since Nov. 5, 1866, and that in all these years he has discharged the duties of his responsible and arduous work with great fidelity to the several members of the association, and with general acceptance to the public. The office is one which requires capacity, integrity and industry, and we have never found the General Agent wanting in any of the qualities. Mr. Simonton leaves the association of his own free will, and not at the request or wish of any of its members. In accepting his resignation our best wishes go with him for his complete restoration to health, for personal happiness and prosperity in all the future of his life.

(Signed) ERASTUS BROOKS,  
In behalf of the Executive Committee.

#### Boston Personals.

To the Editor of The Operator:

SIR: On Wednesday evening, August 3, a goodly company assembled in the spacious parlors of Mr. Geo. F. Milliken's residence, the occasion being the presentation to that gentleman of a testimonial of regard and esteem from his former associates in the Western Union Co.'s Boston office, where he has for so many years most creditably and satisfactorily filled the office of manager.

There were present besides Mr. Milliken's family, Messrs. Jaius Harlow, Cashier; E. F. Leighton, Night Manager; William Martin, Thomas A. Davin, C. D. Stanford, E. B. Pillsbury, Wm. McFarland, C. L. Pope, C. E. Davidson, C. G. Pond, John Mc Grath, F. J. and J. H. Millikin, the two latter gentlemen being accompanied by their wives.

When Mr. Milliken, who had been induced to absent himself during the gathering of the "clan," entered the house he found the hat-rack very much preoccupied, as it were. Hanging his hat on the door knob, he quickly glanced through the open door. Each new face proved a surprise that was unmistakably genuine, and a climax was reached when Mr. Leighton stepped forward, and in a few well-chosen words handed the astonished gentleman a beautiful gold watch with an elegant chain and seal attached.

The recipient replied briefly, and although much taken aback, the few words he uttered satisfied his listeners that much more was felt than could be expressed. Indeed, he frankly told them that he would be obliged to fall back on office regulations and "put it in writing."

These little formalities over a general good time followed, commencing with some excellent singing by a male quartette, consisting of Messrs. Davin, Stanford, F. J. Milliken, and "mine host," who, having now somewhat recovered himself, entered with zest into the pleasures of the occasion. Then came songs by Miss Georgie Milliken and others, and finally the company repaired to the dining room, where, after the good things, provided undoubtedly at the expense of the host, but certainly without his knowledge, had been disposed of, cigars were lighted and the remainder of the evening was pleasantly passed in social converse, speeches, reminiscences, etc., and when all had joined in singing "Should Auld Acquaintance be Forgot," the guests took leave of their former chief and unanimously agreed that one of the most enjoyable evenings of their lives had drawn to a close.

Subsequently Mr. Milliken sent a letter to Mr. Leighton expressing his deep sense of gratitude for and appreciation of the kindly feelings manifested by his late associates, and wishing each and all prosperity and happiness.

J. J. C. Wilson, formerly chief operator American Union, this city, has been appointed superintendent of W. U. city lines and district inspector. At the birth of the American Union, Mr. Wilson worked the N. Y. quad at 109 State st. Messrs. Finan and Dundon have been transferred from the A. U. to W. U., day force. J. W. Wood and P. J. McMahon are enjoying a vacation. They are represented here by L. C. Braulik and John T. Stevens, respectively. Both are from Washington. Frank A. Glidden, from N. Y., is here "subbing" for Chas. A. Hurd, in broker office. We are very sorry to learn that Mr. Hurd

is quite sick. Harvey Wheeler, from N. Y., is with us, and has a corner on the N. Y. quad nights. Frank M. Davis is making a short stay here and is on for Mr. Pope, who is plowing the briny deep with his beautiful yacht. Mr. F. A. Bradford, from the Rapid Co., this city, pleases the boys on the Chicago duplex night W. U. office.

Business is healthy with us. In fact, it has absorbed all the health operators ever had. Men are obliged to work day after day with no prospect of having a vacation, owing to the scarcity of "subs," however desirous a vacation might be. J. R. McLean has resigned to accept a position in Philadelphia. Resignations are now in order, four having resigned since August 1.

X.

#### Chicago Notes.

To The Editor of The Operator:

SIR: The sudden death of John Dyer, at Milwaukee, Monday, 2nd inst., of gastric fever, created profound sorrow among his friends in this office. He was a perfect gentleman and a very talented operator for one so young in the profession. A beautiful floral tribute, consisting of a broken column with the words "C. H." and "30," was sent from St. Paul, Minn., to his home in Hudson, Wis., by order of his friends in this office, with the following message:

H. M. Dyer, Hudson, Wis.: We have just learned of the sad bereavement you and yours have sustained in the untimely death of your brother, at Milwaukee, this morning, and, as friends and co-laborers of the departed, we beg to tender to the family of the deceased our deepest feelings of sympathy. We lose a true friend, the fraternity a kind and honorable member. Please accept this floral offering as a small token of the high esteem in which we hold the memory of our departed brother.

#### CHICAGO BROTHERHOOD OF TELEGRAPHERS.

Arrivals: C. A. Scott, London, Ont.; Frank Barnes, J. W. Garret, Geo. S. Geiger, C. E. Bennett, F. B. Amyx, Abe Bruch, W. B. Montgomery, Kansas City; Michael Burke, Mr. Hovey, Jim Lewis, New York; Miss Jamieson, Aurora, Ill.; Wm. Sleight, Quincy, Ill.; Nelson from Detroit, Fred Robbin from Kansas City.

Departures: Albert Kane, gone with Armour & Co., pork packers, in this city; Griswold, to Ogden, Utah; Geo. Stapley and Al. Hughes, to New York; Geo. W. Samuels has left the American Union for Indianapolis.

Officially appointed: Assistant Chief Lloyd transferred from Division C. to Division A.; Nick Burke appointed Assistant Chief Division C.; Geo. Thompson, Assistant Chief Overland Wires; Geo. N. Willis, to Philadelphia and Pittsburgh wires.

Off on vacations: Will. Kane, Devil's Lake and the Dells of Wisconsin; Gus Carroll, East; Miss Gately.

A petition was lately presented to the management praying that extra compensation be allowed for Sunday work, and thanking them at the same time for the unexpected "extra" for services on the 3d and 4th of July.

T. R. ("Dick") Lewis recently passed through this city, en route to California, via the Southern Pacific Railroad, in search of health. For the past three or four months, he and F. S. Vanvalkenburg have been at Vera Cruz, Mexico, for the Mexican Telegraph Co. Dick will be remembered as a pioneer in overland telegraphy, having been engaged in the Siberian expedition.

CHICAGO, Aug. 8.

The principal electric lighting companies, comprising the Brush, the United States, the Fuller, the American, the Jablochkoff, and the Western, have united in an organization to enforce their numerous and important patents against manufacturers and users of infringing patents.

A Western correspondent writes us: "Apropos of your article in regard to unsatisfactory W. U. service at Kansas City, let me say that that office is and has been the pride and pet of Col. R. C. Clowry, General Superintendent. On that office he built his reputation, and points to it with a great degree of pleasure as an office that does so much work at so little cost. He has not, however, given it out that this model office is the birth place of nine-tenths of the 'bulls' that have afflicted this western country."

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher

NEW YORK, AUGUST 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the *old* as well as the new address.

## NEW TELEGRAPH LINES.

Since it has been demonstrated that a law court is not the proper place to "compete" with the great consolidated Western Union, some of the more enterprising spirits have directed their attention toward the only fair and reasonable way of conducting such competition, viz.: By going to work and building new lines. Although it is only six months since the consolidation was formed, there is already plenty of opposition in the field, and the prospects for operators are fully as bright as when the late lamented American Union was in full blast. The consolidated Western Union, which had early begun to cut salaries and increase hours of labor, has already taken a reef in her sails; the "economists" are either all dead or keep very quiet, and old employes who had been chalked as prospective victims have been solicited to remain.

About the most promising, at present, of the new companies is the "Postal Telegraph Company." It was organized in this city on the 28th of July, with a capital stock of \$21,000,000. Mr. James R. Keene was elected President, and Mr. Henry E. Fanshawe, Secretary; Mr. C. H. Haskins, the eminent electrician, and formerly General Superintendent of the Northwestern Telegraph Company, was elected Vice-President. Among the most prominent stockholders are Mr. J. R. Keene, George D. Roberts, H. Victor Newcomb, Robert W. Mackey, of the Comstock lode, and James O'Brien, the California millionaire. The stock is chiefly in the hands of California, New York and Boston capitalists, although a considerable portion of it is said to be taken in Europe. The purpose of the company is to construct a system of telegraph lines in the United States, Canada, and Mexico, and do a general telegraph business, the prospectus promising that lines equivalent in working capacity to the present Western Union system, and including every *paying* point covered by that company, shall be in operation by Jan. 1, 1883.

The lines are to be constructed on a purely cash basis, and none but through paying lines will be opened at first.

They will use a variety of systems of telegraphy, including the Gray harmonic multiple, by which seven messages can be transmitted over one wire at once; Gray's way duplex system, and Mr. W. A. Leggo's system of fac-simile telegraphy. Under the latter system customers will be served with prepared paper and ink, with which to write their messages. The message is then placed on

a large wheel, alone, or with other messages for the same destination. The wheel revolves rapidly and the electric circuit of which it forms a part is alternately broken and restored by a fine-edged wheel which passes over the letters in parallel lines very close together, and a fac-simile is produced at the other end of the line. The letter may be white on a black ground, or vice versa. Drawings, sketches, and music may be sent in the same manner.

On some of their circuits they claim that a speed of 2,500 words per minute will be obtained by their automatic system. As this would make 150,000 words an hour, or 4,000,000 words a day upon one wire, the number of lines to be built will be correspondingly decreased. Indeed, the new company claims that with this system it can transmit more promptly and reliably all the business between all the leading cities of the country on lines with only three compound wires, with its improved methods, that is now being done on lines with forty wires.

The announced policy of the company calls for "cheap and uniform rates, absolute certainty and celerity in the transmission and delivery of messages without regard to atmospheric conditions, a distinctive commercial business, whereby persons may communicate with each other without the intervention or knowledge of any officer or employé of the company, a cheaper and better automatic stock reporting system, a distinctive postal telegraph system for long messages and letters to be delivered through the post-offices in delivery cities. For this purpose the company will issue postal telegraph stamps at uniform low rates. It will have all its lines completed within 18 months."

The compound wire which the new company intends to use is a steel wire with a copper coating. The process of manufacture is covered by patents. The wire has been used by the American Rapid Telegraph Company for its lines, and it is said to be the only wire over which the "Rapid" system can be worked. The conductivity of this wire is much greater than that of any other wire in use, the resistance being so much less than that of the ordinary telegraph wire, says the prospectus, as to bring "Chicago telegraphically as near New York as Syracuse, compared with the best wire now in use, and bringing San Francisco this side of Chicago. The wire is double the tensile strength of an iron wire of equal size; its conductivity is increased at the joints, while iron wires loses from 25 to 60 per cent. at the joints. It is claimed that the compound wire does not deteriorate with use. The patents covering this wire and the machinery and appliances used in its manufacture, as well as the factory, have recently been purchased by the Postal Telegraph Company. The price paid is said to have been \$1,500,000. This purchase will prevent the American Rapid from extending their existing lines, except upon terms stipulated by the Postal Telegraph Company.

The Mutual Union is also making fair headway, and is now practically at work between Boston, New York, Philadelphia, Baltimore and Washington, and expects to reach as far west as Cincinnati by the 1st of October.

It is now definitely stated that the Baltimore & Ohio Company has decided to go on its own account, and to maintain a separate organization for the transmission of commercial business. This is a bitter disappointment to the Western Union.

Still further agitation is caused in telegraphic circles by the rumor that the Pennsylvania Railroad is about to come forward to heap coals of

fire on the head of the would-be monopoly. The rumor, which, however, is not properly authenticated, although it seems plausible enough, says that at the expiration of existing leases—at an early day—the Pennsylvania Railroad Company will decline to make new contracts; will assume control of all telegraph wires along its road, and will organize an independent telegraphic system for commercial business.

This, then, will place in the field five separate and distinct opposition companies—the Postal, the Mutual Union, the American Rapid, the Baltimore & Ohio and the Pennsylvania—covering every profitable point in the Western Union system.

Symptoms of that despicable method of competition—a pole cutting war—have broken out already in New Jersey. At Montclair a number of the Postal Company's poles have been chopped down, but at present there is nothing to indicate that this action was instigated by any rival concern, and we shall be loth to ascribe it to any particular person.

To all these signs of increasing prosperity we may add an unprecedented amount of telegraphic business, and the determination of all the opposition companies to obtain at least a fair share of the profits—by rendering thoroughly good service to the public, and encouraging instead of blighting loyalty among their own faithful workers.

CHICAGO may always be depended upon to be ahead of anyone else, and, since her operators sent the message of condolence to President Garfield, based upon their claim upon him by having "transmitted broadcast the news of his nomination," she has established still another claim to originality, if not superiority—that of being the only town in the country where the operators are at loggerheads. It seems that "One of the Brotherhood" considered it necessary to reply to certain strictures in the *Chicago Times*, and addressed a note to that paper defending the present admirable telegraphic organization. As might be expected from all such useless controversy, "An Old Operator" replies in behalf of the company, in whose books he has doubtless registered his full name. The *Progressive Age*, of Chicago, thereupon takes the "Old Operator" in hand in a vigorous, though rather primitive, style, informing him that in his role of obsequious fool he represents the feudal times "when men sold their daughters to the 'lord' for a personal place as huntsman;" that he is a relic of the "hat-touching era;" that such "reptiles" have no place in our free country, and that "while it is in the nature of dogs of a certain breed to express gratitude for kicks, men who have manly attributes do not feel much of that sentiment for a corporation which pays," etc. Altogether there is much honest, if not altogether judicious, indignation in our esteemed Chicago contemporary's arraignment of "Old Operator;" and, being professedly a faithful chronicler of all telegraphic events, we thus call attention to it. But, whatever the merits of the case may be, how wrong soever "One of the Brotherhood" may be in his deductions, we are still inclined to believe that "Old Operator"—judging by the tenor of his letter to the *Times*—wrote that document with the sole hope of a ten-dollar increase of salary. He may make his point with the existing management, with whom he possibly has an understanding; but if—that is, if—Mr. Charles A. Tinker should happen to go to Chicago at any time, and exercise his usual keen insight into human nature, he will not be led astray by the

Chinese blandishments of "Old Operator." If the management of a district is faultless, its merit will speak for itself without the necessity of habitual fawners apologizing for it in the newspapers; and, if we have not mistaken Mr. Tinker's character, he will at once get after such professional favor-seekers as "Old Operator" with a stuffed club.

WE regret to have to announce the retirement of Mr. James W. Simonton, the distinguished journalist and orator, from the general management of the New York Associated Press, after fifteen years of active service in that high position. Mr. Simonton received a thorough journalistic education on the staff of the New York *Times* and as a Washington correspondent. For some years past he has been the proprietor of two San Francisco papers—the *Bulletin*, an evening journal, and the *Morning-Call*, the editorial management of which he has continued to direct, notwithstanding that his duties in connection with the Associated Press required him to pass nearly all of his time in New York. He has had for many years control of a number of operators, employed on the leased lines of the Associated Press, all of whom regard his departure as the loss of a personal friend, and none of whom ever yet found a word of complaint against his administration. He has received from the Executive Committee of the Associated Press a most flattering acknowledgment of his fidelity and efficiency, to which we desire to add our humble testimony. His retirement is regretted by the entire press of the country.

SINCE Mr. Simonton leaves the Associated Press in such a high state of efficiency, his successor to the office of Director-in-Chief of the vast ramifications of that organization must needs be an extraordinarily competent and practical man. The selection, however, of Mr. James C. Hueston, an old-time operator, to fill that position is sufficient guaranty of continued good service. Mr. Hueston, who is at present head of the London Bureau of the Associated Press, is well qualified for the peculiar requirements of his new position, being the son of a successful editor, a practical printer and telegrapher, and a graduate of Princeton College and of the Columbia College Law School. He recently attracted widespread attention by his gallant rescue of a drowning woman at Ems, Germany—reported in the last issue of THE OPERATOR—and, if we may judge by the industry and discrimination displayed in his management of the foreign news department of the Associated Press, Mr. Simonton will have a worthy successor. Mr. Hueston was for many years Assistant General Agent in this city, and is highly esteemed here, both as a journalist and a lawyer.

MR. CHARLES A. TINKER, who, it is believed, is about to succeed Col. Clowry in the supervision of the Western Union Central Division, is a well-known and reliable officer, though not more so than Col. Clowry himself. Mr. Tinker, however, possesses many claims for advancement under the new management of the Western Union. He was manager of the military telegraph office of the War Department at Washington, under Gen. Eckert, and was subsequently, for five years, manager of the Western Union office at Washington, succeeding Mr. D. H. Bates in that position. Since then he has been for four years superintendent of a railroad and General Superintendent of the Central Division of the Atlantic and Pacific lines. In company with Mr. Bates, he was one of the nominal organizers of the

American Union, and afterward became Superintendent of the Baltimore & Ohio. He is 43 years old, and has always borne a high reputation as an efficient and considerate executive officer.

THE number of accidental deaths—four during the past eighteen months—caused by shocks from machines used by electric light companies, seems to be creating a sentiment against the use of the dynamo machine. It should not be forgotten that there is no more danger involved in these machines than in a circular saw or any other revolving machinery. No matter what the machinery may be, some inquisitive countryman is bound, sooner or later, to poke his fingers into it, and when he gets them nipped off his friends declaim against the machine. The generating machine is certainly as harmless as any other piece of mechanism, and the sure way to prevent "accidents"—one of which is reported in another column—is to prevent ignorant or careless people from handling them.

IT seems now to be absolutely certain that the Baltimore & Ohio Railroad Company has decided not to accept the proposition of the Western Union to renew the contract made with the American Union, and which will soon expire. The Baltimore & Ohio will then maintain a separate organization, and keep open independent offices at all points on the Baltimore & Ohio, Ohio & Mississippi and Marietta & Cincinnati railroads. It is also morally certain that, upon the expiration of existing leases, the Pennsylvania Railroad and its branches will decline to make new contracts with the would-be monopoly, and will assume control of all wires along its lines, hiring its own operators for the transaction of commercial business. All of which is good news for the operators.

WE have to congratulate that intelligent and faithful body of young men comprising the U. S. Signal Service upon the decision of the Attorney-General that the two commissioned officers who are permitted by law to be appointed annually to the signal corps shall be selected from among the enlisted men. A strong effort was made to have certain officers taken from the regular army, so as to give them an easy berth in Washington, upon the pay-roll of the Signal Corps, without regard to their efficiency in that branch of the service, and we are glad to see that, under the Attorney-General's decision, the commissions must now be given to worthy sergeants in the corps.

THE new cable rates—twenty-five cents per word—went into operation on the 1st inst., and still the old companies appear cheerful. Mr. John Pender, in addressing a meeting of the Direct Cable Co. recently, in London, said: "If the American company will conduct their business in a fair and business-like manner, there will be enough for them as well as for us." We sincerely hope that Mr. Pender's statement is based upon accurate calculations as to the profits accruing from a twenty-five cent rate, but, if it be correct, why did the idea not strike the late cable monopoly before?

THE great number of people killed by lightning during the present summer is most alarming, but when we find the electric bolt suddenly descending from a cloudless sky, as has twice happened during the past fortnight—once at Wilkes Barre, Pa., and again in South Carolina, where a single flash killed four men and wounded twelve

—there is cause for the gravest apprehension. While our scientists may not be able to afford us protection, the relations between heat and electricity are so close that the subject may be found interesting to them.

THE laying down of the cable between Berlin and Stetin completes the subterranean telegraph system in the German empire. These cables now cover 3,420 miles, nearly all of them having seven wires. They are laid beneath all the principal rivers, and establish direct telegraphic communication between 221 different cities and towns of the German empire. The first cable was laid four years and eight months ago.

THERE has been so much talk lately about reduction of salaries by local martinetts, that some one at headquarters seems to have interfered, since the tide has suddenly changed. The "one case of a clerk in Charleston" who had his salary "rearranged" seems to have been pretty numerous; for since the "clerk in Charleston" was told to stand up and show himself, the woods appear to be full of them.

WITH our experience of the tardiness of international exhibitions, we should not be surprised to hear that the Electrical Exhibition at Paris was not ready to be opened on the 1st inst., and that its opening was postponed until the 11th. It is now open, however, though many of the exhibitors are considerably behind hand. A report of the opening, with other interesting matter in reference to the exhibition, from the special correspondent of THE OPERATOR, will be found in another column.

DR. TANNER, the great faster, is drawing up propositions to the medical faculty of New York to fast three months. He said to a reporter that he can fast ninety-five days if fed on electricity, the air in his room to be charged with a strong current. This being positive, he can obtain a negative element from the disintegration of his tissue.

THERE is still time, and, in the interest of science, Professor Bell should send his improved induction balance to the Electrical Exhibition at Paris. The improvements made upon this simple device and its recent successful application in the case of our President are alike creditable to American genius.

WE much regret that, owing to unavoidable circumstances, it was impossible for us to secure the biographical notes for the subject of Our National Portrait Gallery, even for the present issue. The information, unfortunately, came too late to permit of preparing the portrait of a substitute.

THE success of Professor Bell in accurately locating the bullet in the President's body, by means of his improvement upon the Hughes induction balance, is extremely gratifying. Electricity has thus added one more valuable implement to surgery.

THE business of chopping down the poles of new telegraph companies seems to have recommenced in New Jersey. The Postal Telegraph Company is the victim this time. The choppers are unknown.

THE comparative falling off in telegraphic news incident to the dog days, permits us to compress the paper into our regular size (sixteen pages) once more,

**Milwaukee Melange.***To the Editor of The Operator :*

SIR: The first month under the new regime of the W. U. has wrought many changes in the old N. W. force. Experienced and reliable men have been allowed to go, their places being mostly filled by raw recruits from railroad offices, etc., until but one or two first-class men can be found on the once excellent force. Resignations continue to be handed in at a rate that is astonishing to our worthy (?) manager, who seems to be totally indifferent as to the injury he is doing the company's interests, in not offering some little inducement to the really good men who cannot submit to the present management as regards hours of labor and diminutive salary. The night force are well off in comparison with the day men. The former are paid extra after seven hours labor a day, while the latter are required to work  $9\frac{1}{2}$  hours a day, and in addition two hours every third night, and three hours every other Sunday, for which they receive nothing whatever.

A series of very questionable actions have lately been indulged in by the chief operator, which have caused those affected thereby much pecuniary annoyance. Some three or four of the men, becoming dissatisfied with the work allotted them and the small salary they received, tendered their resignations, which were accepted conditionally, that is, when men could be procured to fill their places. As men in search of situations, however, were not over-numerous, the chances for their getting relieved in the near future were very slim. Overtures were made to the men by the chief, who offered to change their tricks, and increase their salaries from \$5 to \$20 each, to take effect at once. This the men accepted. When pay-day arrived, they found to their chagrin that their salaries were unchanged, and the manager coolly informed them that the chief was not authorized to supervise the pay-roll, and he himself had no authority to raise salaries without orders from the superintendent, which he expected to receive sometime during the coming month.

Late arrivals: Davison, Anderson and Ames, St. Paul; Peabody, from Minneapolis; Miss Spears and A. S. Shape, from Fond du Lac; Davenport, from Atchison, Kan., and Miss Webb, from Morris, Ill.

Departures: Angell, St. Paul; Wilson, New York; Palmer, Boston; Brady, Chicago, and Miss Gether to Oshkosh.

John A. Dyer, recently arrived from St. Paul, and employed on the C. & M. force, died here after a week's illness.

J. M. Marlet has been transferred to Board of Trade force.

H. M. Scott, manager Board of Trade office, has left on a wedding tour to the East for two weeks. OCTOPUS II.

**Omaha (Neb.) Notes.***To the Editor of The Operator :*

SIR: Luke Fisher, after many moons journeying in the East and South has at last landed again at "Om." and it is reported he will soon take unto himself a "partner;" further the deponent sayeth not. Jim Clute has retired once more to the rural seclusion of Red Oak, Iowa, as operator for the C., B. & Q. He took with him one of Omaha's fairest school "marms." May Jim and his wife live long and prosper. L. M. Rheem, the new manager of the W. U., is spoken of very highly by the boys, and we hope he will treat the men under him as well in the future as he has since assuming charge of that office. Tom Curry stood his little "set-back" with as good grace as possible. He says it is all in a life-time. Tom was offered several inducements to leave the W. U. after the consolidation, but he preferred to "stick it out" and see what old mother "Monop." had in store for him. We hope it will be something good when it comes. Tom deserves it, if any one does. He has been a faithful worker for the W. U. C. E. Mayne, for several years night manager of the W. U., has resigned and accepted a pleasanter and more lucrative position with the "Omaha Daily Bee." Mr. F. M. Crittenton has been appointed to fill Mr. Mayne's place. "Dad" Armstrong, late Manager of the A. & P., now works one corner of the "Ch." quad, at "Om." Omaha has its usual number of old-timers, and first-class men.

Among them we notice: "Fatty" Stone, Geo. McMahon, Ed. Dennison, Perry Chamberlain, A. H. Mayne, Con. Dwyer, S. J. Ritchie, Clarence Foote, J. B. Twiford, Geo. Gould, J. B. Prichard, Geo. Arbuthnot, Mr. White, Mr. Murphy, Mr. Hulahan (of Detroit), Mr. Rusland and Mr. Storm.

It is "rumored" that Sam. Ritchie is going to Minneapolis as chief operator. We hope Sam will "catch his man" in Minnesota. Mr. McGuire, the gentlemanly all-night chief, still holds the fort after 12 o'clock. Charley Horton, as cashier, continues to finger the cash and say "no" to the boys. George O'Brien and George Dickenson are the train dispatchers for the Bridge Division of the U. P. Jo. Boyd is still chief dispatcher for the East Division of the Main line. Mr. Cralle has been appointed chief operator of the U. P. general office, telegraph department. OKCG.

**Buffalo (N. Y.) Items.***To the Editor of The Operator :*

SIR: Some of the boys are getting discontented. The men with whom they work in other cities tell them of the salaries they receive, and the boys can't understand why their salaries should not be as large, doing the same work. For instance, one man, who resigned and went to another city, draws \$32 more per month for the same work he did here. Manager Tillinghast and Chief Operators Kitton and Reynolds are trying their best to get the boys graded so they will be satisfied, and applications have been forwarded to Supt. Gifford for an increase of salary for about twenty men, with Mr. Tillinghast's approval, but this has not yet been heard from, and the general opinion is that the "shell bursts" in Mr. Gifford's hands, as he is generally considered to be in favor of \$50 men, and will, perhaps, bring on farmers from Cohoes, Skaneateles, and Herkimer county, to fill vacancies.

The departure of first-class men is on the increase, while the incoming operators, with two exceptions, are very poor. I am informed that Messrs. N. H. Perrin, T. J. Tynan, S. A. Farley and W. H. Pinkney have sent in their resignations on account of insufficient salary. Among the new arrivals we notice Jeff. Prentice from Texas, who turns out beautiful copy and cannot be excelled at the key. GUESS.

**Southern Salaries.***To the Editor of The Operator :*

SIR: There appears to be some dispute or misunderstanding between the "prominent officials" and THE OPERATOR, or rather its correspondents. On the first of June the manager of this office was notified to discharge one clerk, reduce salary of bookkeeper \$5 per month, all operators receiving over \$85 to be reduced \$5. He was also ordered to discontinue all extra to the operators. This was a general order issued from New York. I can't see for my life how the "prominent officials" in New York could have been so ignorant in regard to the reductions, when they themselves issued the order.

Two men from the A. U. were placed in W. U. here first June, but they were reduced five dollars per month, making their salary \$75. Both were first-class men. The general order in regard to the extra has since been rescinded, but instructions to the manager are not to allow any extra to be made, if it is possible to avoid it. We expect the Cotton Exposition, which opens here first of October, to create a "boom" in business, and we will need more men. Good men are very scarce all over the South. Supt. Meriwether complains that he cannot get men to fill places now open in his district. Operators' Union will organize here on 7th inst. THICK LIP.

ATLANTA, Ga., Aug. 4.

**Oil City (Pa.) Personals.***To the Editor of The Operator :*

SIR: Variety being the spice of life, the power behind the throne seems inclined to allot Oil City its full quota. We have had three changes in the management here within the past four months. At consummation of the consolidation, Oil City came under the jurisdiction of Supt. D. O. Wickham, who installed W. A. Drake as Manager, vice M. E. Luce, resigned. July 15th, D.

O. Wickham, resigned, being superseded by C. O. Rowe, who placed Frank Ross, Circuit Manager, in charge as Manager and Circuit Manager. Mr. Drake retires with an unsullied character. During his managership he proved himself a man of sterling character. Mr. Ross is deserving of great praise for the manner in which he discharges the onerous duties of manager, circuit manager and chief. S. M. McKee has resigned as Assistant Circuit Manager and Chief, and takes his place with the "boys." W. A. Drake and C. C. Klumph have been transferred to Pittsburgh, where they work the Philadelphia duplex. J. H. Gross has been transferred to Philadelphia. He leaves a record of handling 100 messages, with Ahrensburg, of the Pittsburgh Oil Exchange office, in 27 minutes. The dates were omitted, as is done between all oil exchanges. The above constitutes all changes in Oildom since our last. "ME TOO."

**TELEPHONE DEPARTMENT.**

Ann Arbor and Ypsilanti, Mich., have been connected by telephone.

There are now nearly 150 offices connected by telephones in Hamburg, Germany.

The Chicago Telephone Co. has opened an exchange at Elgin, Ill., with Mr. Wm. Hubbard, a well-known old time telegrapher and inventor of the Elgin acoustic telephone, in charge.

The Empire State Telephone and Telegraph Company has its principal office in Auburn. The purpose of the company is to establish communication, both telephonic and telegraphic, between certain points in Yates, Oswego, Onondaga, Cayuga, Wayne, Ontario, Monroe and Seneca counties, New York State. The capital stock of the company is \$50,000, but power is given to increase the stock to \$200,000.

Our telephone friends must not forget that the next telephone convention takes place at Saratoga, N. Y., on Tuesday, September 6. We endeavored to get, for publication in this issue, some information as to what is being done by the officers of the association in the way of preparation, but have received the reply that the details have not yet been sufficiently perfected to publish anything about it. It is hoped that the next convention will be largely attended.

Mr. P. N. Hay, station lineman at the John street office, M. T. & T. Co., resigned his position on the 30th July to accept a more lucrative one in the Eastern States. Mr. Hay was one of the best linemen in the company's employ, and leaves behind him many warm friends, who wish him the best of success.

The handsome gold medal bearing the following inscription has been presented to Mr. Hay: "To Philo Hay, as a token of esteem, by the employes of 198 Broadway."

The Providence, R. I., exchange has 975 subscribers, 400 wires and 24 operators, all told. A new, light and commodious operating room is being fitted up. The switches, which are very handsome and contain all the latest improvements, are from the manufactory of Messrs. Post & Co., Cincinnati, O. To prevent the necessity of grounding wires in "cutting in," Snell jacks are attached to all the switches. This plan is said to work admirably. The superintendent, Mr. J. W. Duxbury, is a well-known electrician of long and varied experience, and the exchange under his supervision is giving its subscribers splendid service. Mr. A. C. White is electrician and manager.

Mr. T. G. Ellsworth, manager of the John street office of the Metropolitan Telephone and Telegraph Co., New York City, recently held conversation with several employes of the company over an open wire. The circuit, two miles in length, was opened at a fixture on the roof of a building, one end of the wire being fastened to the insulator in the usual way, the other end tied around the cross-arm of the fixture not nearer than three inches from the insulator. The telephone current passed through the resistance of a Brooks rubber insulator and three inches of the wooden cross-arm, which was perfectly dry, no rain having fallen for several days.

Conversation was easily carried on during the test, with the telephones in ordinary use. The high tension of telephonic currents has been con-

sidered to be great, but this test shows them to be much greater than is generally believed.

The Gilliland Electric Manufacturing Company, of Indianapolis, are the largest manufacturers of telephone supplies in the world. The company is named after Mr. E. T. Gilliland, "our western Edison," a Cincinnati boy in whose well and hardly-earned prosperity a host of old friends rejoice. The company yesterday shipped a car load of telephone apparatus, consisting of 1,000 bells and 15 switch-boards, etc., for which the Merchants' Dispatch Transportation Co. issued a through bill of lading to Antwerp, Belgium, via Red Star Line Steamship Co., New York. This is the largest shipment of telephone supplies ever made, and will be followed by others of same quantity from time to time. The company is shipping to all parts of the world, their apparatus having the best improvements and being eagerly sought after.—*Cincinnati Commercial*, July 19.

Mr. H. W. Pope, 29 Murray street, New York, Chairman of the Committee on Subterranean Lines of the National Telephone Exchange Association, has issued a circular in which he asks telephone men to forward to him as promptly as possible any statistics or general information regarding the construction or operation of subterranean lines within their jurisdiction, together with as full answers to the questions herein as possible: 1. Has any attempt been made to force the construction of subterranean line, and with what success? 2. What laws, ordinances, etc., have been adopted in your State, city or town in regard to the construction of underground lines? 3. What subterranean system is being introduced and constructed within your jurisdiction? 4. Is it constructed and operated by any independent organization? 5. Is not the great expense, together with the extreme difficulties to be met in the construction and operation of subterranean lines, likely to result finally in the adoption of an aerial cable system; and is not such a system preferable?

Andrew Albright, a wealthy manufacturer of Newark, and Charles Holzhauser, a druggist, have been cited to appear in the United States District Court at Trenton, N. J., to answer a suit brought against them by the Bell Telephone Company. The suit will test the question of whether Alexander G. Bell is the originator of the principle of transmitting sound by electricity. About eight months ago Mr. Albright went to New York and purchased two Bell telephone instruments, which he caused to be placed, one in his factory and the other at his residence. He connected them with wire, and used the line thus constructed for private business. Recently a lawyer from New York waited on Mr. Albright, and ordered that he should at once desist from the use of the instruments, and surrender them. Mr. Albright declined to do either, and declared his readiness to have the question tested in the courts. He said he did not recognize Mr. Bell as the originator of the transmission of sound by electricity, but that it was originated in 1861 by a resident of Pennsylvania, named Reis. He also claims that he bought and paid for the instruments and has a right to use his own property. Mr. Holzhauser takes the same stand, although he has not yet put his instruments into use. Both gentlemen have been served with notices to answer to the telephone company's summons at the September term of court.

## DASHES HERE AND THERE.

Western Union stock is quoted at 89. Last issue it was 86 $\frac{1}{4}$ .

The new steamship *Servia*, of the Cunard Line, is being fitted with 98 electric lamps.

The Municipal Council of Paris intend to tax telegraph and telephone wires in sewers.

All the chief French light-houses will soon be lit by electricity, and provided with powerful steam trumpets for fog signals.

If you want to become a telegraph operator send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.

It is reported that the Edison and United States electric lightning companies are considering a proposition for the settlement of their disputed points without litigation.

The Brush Electric Light Company has purchased a lot in Philadelphia upon which it will

erect a large plant for lighting Chestnut street and such business places as it may have orders to supply.

A dispatch from London says that, on Monday last, by invitation of the Messrs. Siemens, the ocean cable manufacturers, 150 delegates to the International Medical Congress visited the cable construction steamer *Faraday*, and inspected the new cable for the Anglo-American Company.

The University of Griefswald can now boast of the largest electro-magnet ever constructed. Twenty-eight iron plates have been bent into a horseshoe shape, and connected by iron bands. The magnetizing helix consists of insulated copper plates and wires.

James Mayorga, aged 15, a Mutual Union District Telegraph messenger, wilfully misplaced a switch on the Hudson River R. R., at Sixty-first street and Twelfth avenue, and very nearly sent a train to destruction. They put him in jail to think it over.

At a meeting on the 8th inst. of the stockholders of the United States Electric Lighting Co., it was resolved to increase the capital stock of the company from \$1,100,000 to \$1,500,000. The increased stock is to be used as working capital. The latest quotation of the company's stock was 235.

Samuel Hagan, a 12-year-old A. D. T. messenger, of this city, has just been sentenced to ten days' imprisonment in the city prison for tearing up a message he was sent to deliver. This is the first conviction under the new law, which makes it a misdemeanor for a telegraph messenger boy to destroy or fail to deliver a message.

The Brush Electric Light Company, of Baltimore, has a force of some seventy men at work at its Central Station, grading the ground and preparing for the foundation of the new building in which will be placed the first plant of the company. The company has now more orders on hand than it can fill for some time to come.

The "Long Distance Electric Call Company" filed articles of incorporation in the County Clerk's office in this city, on the 6th inst. Its objects are the manufacturing, operating, furnishing and renting of all kinds of electrical apparatus used in transmitting telegraphic or electrical calls and messages and electrical communications of every description, and the production of electrical illuminations. The capital stock is \$50,000. The incorporators are James N. Jameson, Wm. C. Lockwood, James Brady and Alfred P. W. Seaman.

Some crazy fellow in Lancaster, S. C., handed in the following message: "We in South Carolina had nothing to do with shooting Garfield, but I'm not going to shed any crocodile tears over it." Payment for the message was tendered, but the operator, Mr. Brennick, refused to accept the money or transmit the telegram. He tore it up and drove the man from the office. This was certainly patriotic, but we fail to see the benefit to the company if operators are allowed the privilege of tearing up messages and driving customers by force of arms from the office.

Just after an unusually heavy flash of lightning during the storm last Sunday evening, about 30 wires running into the Western Union main office in this city were suddenly enveloped in flames. They had been "struck" by the electricity in the atmosphere, and the rubber insulating coating of each wire burned like paper. For a moment everybody was startled, but the cooler ones soon recovered, and by cutting the wires prevented any further damage from being done. It took all night to put the 30 wires in working order again, but there was no delay in the business of the office.

A man was killed in Buffalo, N. Y., Aug. 8, at the rooms of the Brush Electric Light Co., by touching the wires of a dynamo machine. The victim, George Leonard Smith, had been previously cautioned not to touch the machine. Disregarding these warnings, Smith caught hold of the "brushes." The manager stopped the engine instantly, when Smith threw up his arms, gave a long, deep gasp for breath, and instantly expired. The thing was done so quickly that those who witnessed it could scarcely believe their eyes. Smith's face had assumed a pale bluish tint, and was drawn out of shape. His hands were badly burned, and on several of the fingers the flesh was burned to the bone.

The annual meeting of the stockholders of

the Edison Electric Light Company of Europe was held recently at the Fifth avenue offices of the Edison Company. T. A. Edison, James H. Banker, Robert L. Cutting, Fred. W. Foote, and S. B. Eaton were elected directors of the company. No further business was transacted save to discuss the arrangements of the company for the introduction of the Edison light in Europe. In addition to its exhibit at the Paris Exhibition the company is going to make a test exhibition of the workings of the Edison system for the satisfaction of a French syndicate formed for the introduction of the light into Paris.

Regarding the difficulty of finding a suitable insulator for electric-light wires underground, Mr. R. J. Sheehy, Superintendent of the Brush Electric Light Company of this city, made an affidavit recently to the effect that no insulating compound had yet been made that would answer for the transmission of power for his company's electric light. Compounds that would answer for telegraphic and telephonic uses would not do for the electric light. S. B. Eaton, Vice-President of the Edison Electric Light Company, says that all the wires of his company will be laid underground. The system consists of an iron tube, two inches in diameter, filled with an insulating compound of Mr. Edison's own invention, impervious to heat, cold, or moisture. Inside the tube, imbedded in the insulation, are two copper bars or discs, each one inch broad, and one-quarter of an inch thick, which carry the positive and negative currents. It has been used in Menlo Park six months with perfect satisfaction, extending over six miles of wire. It was only a foot under ground, but it will be placed two feet below the street in this city.

## PERSONAL.

Mr. E. R. Chapman, of 115 Dearborn street, Chicago, is Western Superintendent of the Mutual Union Telegraph lines. Mr. Geo. Farnsworth, for many years manager of the A. & P. at Indianapolis, Ind., is Superintendent of Construction at Toledo.

Parsons, Kan., has the following operators: Miss Sallie Judkins is manager of the W. U.; F. B. DeGarmo is operator for Mo. Pac., days, and G. E. McGonegal night owl. A. W. Gay, F. C. Cowden and H. F. Hindmarsh (the latter late of Muirkirk, Ont.), are the train dispatchers.

Messrs. Cross and E. A. Randall from Vermilionville, La., have been added to the Houston, Texas, W. U. force. Day Chief J. A. McNabb has resigned to go to Kansas City, Mo.; no one has yet been appointed to fill the vacancy. Work is very heavy and brisk demand for operators, but none to be had.

On July 6, Hattie May, aged 2 years, daughter of Frank H. Borhek, agent and operator at Atco, N. J., died of diphtheria. On July 13, Mr. Borhek's family was again visited by death, Gertrude Amanda, 5 years of age, the last of his children, being taken away by the same dread disease. The family has the heartfelt sympathy of Mr. Borhek's associates and friends in this their sad bereavement.

Mr. R. W. Pope has resigned his position as Deputy Superintendent of the Gold and Stock Telegraph Company, this city, to accept the General Managership of the Union Electric Manufacturing Company, 7 and 9 Bond street, New York. Mr. Pope has been nearly ten years in the G. S. service and is one of the best known and most popular men in the business. His many friends will wish him every success in his new field of labor.

Mr. W. T. Westbrook, who has been manager of the Western Union office at Wilmington, Del., for 22 years, has resigned to engage exclusively in the telephone business, in which his large experience, telegraphic and otherwise, will doubtless insure him success. Mr. Westbrook has been in the service 31 years, commencing as a messenger boy.

Mr. Chas. E. Wise, late of the Western Union office at Newark, O., has been appointed manager in place of Mr. Westbrook.

The position of superintendent of telegraph of the Baltimore & Ohio Railroad Company, made vacant by the resignation of Mr. C. A. Tinker, has been filled by the appointment of Mr. Robert Stewart, Mr. Tinker's immediate predecessor in

the same position. Mr. Stewart is an experienced telegraph and railroad man, who was formerly in the employ of one of the New Jersey divisions of the Pennsylvania Railroad. He left there to become Superintendent of the Baltimore and Ohio telegraph system. In February, 1879, Mr. Stewart resigned the superintendency of telegraph and went to the New York Elevated Railroad. Mr. Tinker succeeded him as superintendent of telegraph of the Baltimore & Ohio Railroad. Mr. Stewart is a man of about 45 years of age, and a popular officer.

GRAND RAPIDS, MICH.—Mr. Charley H. Thompson, W. U. press man, has just returned from a trip to Detroit, bringing home a blushing bride. Mr. T.'s many friends extend hearty congratulations. Mr. J. A. Weeks, from Detroit, has been lately added to our force here. He is a clever telegrapher and a candidate for matrimony. Mr. George Darlington is in dispatcher's office of the G. R. & I. R. R. Co. at this place. Mr. Walter W. Watson, one of the stalwarts from the Louisville & Nashville R. R., has just arrived in Fort Wayne, Ind., and is dispatcher's operator for Southern Division G. R. & I. Telephones and the Brush light are on the boom here. The city now proposes to build ten or twelve towers to light the streets and do away with the gas.

ALEXANDRIA, VA.—Mr. Dinwiddie, chief dispatcher V. M. Ry., has returned from the Springs, and the regular force at the main office of that company is unbroken. At Rapidan, Va., Mr. Preston has resigned, and James Duke now fills his place. Jimmy is a brother of the courteous and well-known "Duke of Alexandria," now chief operator A. U., Washington, D. C. Mr. Wilmer Padgett, for many years with the W. U. in Petersburg, and who was never so happy as while entertaining visiting operators, and regaling them with wine and huge accounts of the work of that office, has forsaken the business and is now agent of the Potomac Steamboat Co. at this point. The good wishes of a host of friends follow him. Mr. Otis Franks, of Alexandria, well known in Brooklyn R. R. circles, has left the C. & O. R. R., and gone to Dallas, Tex. THE WHAUP.

## BORN.

HACKING.—Aug. 1, to C. Hacking, Agent Dom. Tel., Grand Trunk Ry. and American Ex. Co., Listowel, Ont., a son. First edition.

Address THE BLANCHARD MFG CO., 27 UNION SQUARE, N. Y.

DR. BLANCHARD CONSULTED FREE, IF POSTAGE IS PREPAID.

**The Tonic Extract of Wheat** improves weak digestion, cures sleeplessness, nervousness, constipation, loss of appetite and power. Especially adapted to repair brain waste from study, care or grief. Prevents and cures Bright's disease, diabetes, uterine weaknesses, rheumatism, neuralgia and all malarial diseases. Strengthens to overcome evil habits. Adapted for table use. \$1 each, or six bottles for \$5.

**The Fibrin and Wheat** restores the confirmed dyspeptic stomach and cures all forms of long standing nervous debility. Vitalizes weakly children and energizes old age. Sure preventive and cure for diphtheria, infantile diarrhoea and cholera infantum. \$2 each, or six bottles for \$10.

**The Beef and Milk** is for a very weak condition, and never fails to assimilate, however weak and irritable the stomach. Invaluable for nursing mothers. \$2 each, or six bottles for \$10.

**The Life Food** is to be taken between meals to relieve sense of "goneness." Never failing remedy for the alcohol, opium and tobacco habit, and for insanity and cancer in their early stages. \$1.50 each, or 6 bottles for \$7.50

## THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

## PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**  
140 FULTON STREET, NEW YORK.

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.  
And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

#### The Leclanche Battery Co.,

40 West 18th St., New York.

## A. G. DAY,

MANUFACTURER OF

### Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

### DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

### Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, Sir WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

### Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

# THE LECLANCHE PATENT TELEPHONE BATTERY.

The Same Yesterday, To-Day and Forever.

PRISM BATTERY.

Having long since emerged from the pupa state, in which so many cheap imitation Leclanche batteries have already expired, or are now dying, this Battery is to-day firmly established as

PRISM BATTERY.

## THE ONLY OPEN CIRCUIT BATTERY IN THE WORLD

which can be kept in use for months without consuming itself by local action. Combining the greatest intensity and electro-motive force with the least resistance, its practical advantages have made it the most successful battery ever produced.

## GREAT REDUCTION IN PRICES

have been made since its general introduction into the United States, and it can now be bought for less than one-half the price it was formerly sold at. This, added to the fact that it is the best Open Circuit Battery ever made, has resulted in its becoming the most popular, as it is the most effective, Battery in the world. OVER ONE MILLION CELLS are now in use, and the demand for it is daily increasing. It is the LEAST EXPENSIVE, SIMPLEST, CLEANEST. REQUIRES NO ATTENTION. DOES NOT GET OUT OF ORDER. GIVES PERFECT SATISFACTION IN EVERY CASE.

**It is the Best for SCIENTIFIC AND EXPERIMENTAL PURPOSES.**

**It is the Best for MEDICAL PURPOSES.**

**It is the Best for HOTEL AND HOUSE ANNUNCIATORS AND CALL BELLS.**

**It is the Best for ELECTRIC BURGLAR ALARMS.**

**It is the Best for TELEPHONE TRANSMITTERS.**

The latest form of this Battery is known as the "PRISM BATTERY."

In this Battery the porous cup is dispensed with, and in its place is substituted a pair of compressed "Prisms," or plaques, which are simply attached to the carbon by means of two rubber bands.

The "Prisms" contain all of the materials heretofore employed in the porous cup, combined with others not before used, compressed into this compact and convenient form by powerful hydraulic machinery.

The advantages of this over the porous cup, or any other open circuit battery, are apparent :

1. All of its parts are visible, and in case of any derangement it can be seen at once where the difficulty lies.
2. The battery can be taken apart, cleaned, and set up again by any one, without special knowledge of electric apparatus.
3. But its most important feature is the comparative cheapness with which it can be renewed when the elements have become exhausted from long service : by simply substituting a pair of new prisms for the exhausted ones, the battery will be made as good as new.

This battery is particularly suitable for use with battery telephones, and, after having been thoroughly tested by the various Telephone Companies, has been pronounced by them, without exception, the most perfect battery for telephone purposes that has been made.

With their endorsement and the results of our own tests, which have extended over a long period, and have been most thorough in every respect, we feel warranted in recommending the new Leclanché Prism Battery to the public.

**We are prepared to furnish these celebrated Batteries in any quantities on exceedingly favorable terms.**

# TELEGRAPHIC SPECIALTIES.

## THE GIANT SOUNDER PERFECTED.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5 00.

## THE DELANY PATENT REVOLVING DISC,

OR UNIVERSAL PLATINA CONTACT KEY.

This key embraces the only positive remedy for sticking; obviates direct anvil pounding, and thereby prevents operators' paralysis. Legless, hard rubber base, nickel-plated, and the handsomest, most durable, and only perfect key manufactured. Price, \$5; by mail, \$5.35.

## CHAMPION LIGHTNING ARRESTER.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

## THE CHLORINE BATTERY.

D. H. Fitch Patent, Sept. 16, 1879. For telephones, burglar alarms, call bells, etc. Price per cell, \$1.75.

## PREMIUM LEARNERS' APPARATUS.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit.....	Money in advance, \$5 00

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

## District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

## PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

## SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## NEW NO. 2 MAGNETO BELL.

POST & CO.'S

## New No. 2 Magneto Bell.

CINCINNATI, Aug. 1, 1881.  
We have just perfected our New No. 2 Automatic Magneto Bell (as per cuts), and are now ready to furnish same to Exchanges and Agents of the American Bell Telephone Co. We guarantee same to ring over 10 miles of wire. We have given great attention to the construction of these bells and they will be found just the bells for short lines of all kinds—will gladly send out one bell or a case of 6 on approbation, to be returned if not satisfactory.

We call especial attention to our new switch-boards as being simple and substantial, NO CORDS TO GET OUT OF ORDER. We make them from 6 lines each up to any size wanted. Send for cuts of same. Our new battery boxes open down the front, so as to get at battery easy. We make them two sizes, for each size bell, also very fine ones for parlors and fine offices. Samples of our bells, etc., sent on application. Agents for Roebing's line wire. A full line of OFFICE WIRE BRACKETS, INSULATORS, etc., on hand at all times at VERY LOWEST prices. Send for catalogue and prices.

## Standard No. 1 Magneto Bell, 20,000 in use.

Below we give a few important changes we have just made in our Standard Magneto Bells, making them the strongest and best Bells made. All of these important points fully covered by Letters Patent.

1st. Our Horse Shoe Magnets, large and small, are made to lift six times their weight; none are passed unless this result is obtained. This strength is secured by means ONLY KNOWN TO US.

2d. The cylinders of our engine are metallic and inclosed so as to prevent escapes of any kind, and also prevent dust from accumulating on the armature, which in a very short space of time would wear out and destroy the GENERATING POWER of the ENGINE. Other makers NECESSARILY leave the sides open.

3d. Our switch is so constructed that it prevents lightning in ANY FORM from ENTERING THE MICROPHONE, by cutting out the primary and secondary coils entirely—a feature that no other box now manufactured has, and fully covered by our letters patent.

4th. We make the Automatic Hook Bell to use with the PONY CROWN TELEPHONE. NO EXTRA CHARGE. No posts on front. Connection made at top and bottom of Bells.

5th. All Bells tested to not less than 12,000 ohms resistance.

6th. We have so arranged the RINGER, GENERATOR, and FRAME work of our Bells that they can be easily adjusted without disturbing the wires in any manner or moving the base-board or bell.

7th. Test of Standard Magneto Bells at Exposition, Oct. 1, 1880. Williams Magneto Bells rang through 11,800 ohms resistance, equal to say 370 miles No. 12 wire.

Post & Co.'s Magneto Bells rang through 19,775 ohms resistance, equal to say 625 miles No. 12 wire.

The record of this test is taken from Report of the Jurors in Class 77 on Electrical Instruments, and NEEDS NO COMMENT, as it shows our Bells have nearly double the strength of the others. The Gilliland Bell did not come in, although APPLICATION had been filed to enter same for competition. The jury awarded our Bell the HIGHEST PREMIUM—A SILVER MEDAL. Respectfully,  
POST & COMPANY.

POST & COMPANY, CINCINNATI, O.

### ANACREONTIC.

List me now, I plume a knight.  
Lo! No faded antique wight—  
Spindle-shank and ample shield,  
Sneaking from the battle field—  
But my knight of later day  
Claims the poet's bravest lay.  
Proudly tossing to the rear,  
Waves the goose quill from his ear;  
Helmetless, his shining nub  
Braves th' official stuffed club.  
Ne'er he plated armor wears,  
Solely for a shield he bears,  
'Neath the haughty archèd lip,  
One small patent office clip.  
Lance nor spear nor sword wants he,  
Give him but the brassy key;  
Thirsts he not for bleeding corse,  
Merely would he slaughter Morse.  
With sulphuric acid bright,  
Pledge my telegraphic knight!  
Brim the cell of gravity;  
Drain the jar and mirthful be  
Quick'ning with 'lectricity.  
Now once more come pledge my knight,  
Lo! no faded antique wight—  
Spindle-shanked and ample shield,  
Sneaking from the battle field—  
But a knight of later day,  
Worth the poet's bravest lay.

FRANK C. PRESCOTT.

OAKLAND, Cal., Aug. 18, 1881.

### The Paris Exhibition Well Under Way.

[From The Operator's own Special Correspondent.]

On the day preceding the opening of the exhibition all work was ordered suspended and a general clearing up requested, that due respect might be paid to President Grévy and a few high state officers who wished to make a private inspection before the general public were admitted. The gentlemen arrived at 10.30 A. M. and, under the guidance of the French Commissioners, leisurely sauntered through the hall, stopping here and there to inspect some object of particular interest, and continued their visit until about noon. With the exception of some music by a military band, there was no display or ostentation of any kind, and, had the dignitaries not been pointed out, I would not have known that they were in the building. During the remainder of the day a favored few were admitted on complimentary tickets and on the following morning the doors were thrown open to the public. Considering what a fine opportunity there was for an imposing opening ceremony, we foreigners were surprised at the extreme simplicity of the affair.

The Executive Committee of the U. S. Commissioners, consisting of Dr. F. L. Freeman, of the Patent Office; Capt. D. P. Heap, U. S. A., and Lieut. T. C. McLean, U. S. N., called a meeting of the American exhibitors on Aug. 5, to ascertain how nearly ready they would be to open on the 11th, and also to consider the question of decorating the space allotted to them. The Commissioners thought that the American section had a "flat" appearance, or, as Dr. Freeman expressed it, looking at our section from the galleries, and comparing it with the display being made by other countries, was like looking into a hole. The reason for this is that our exhibit is of a different nature from the others, which are made up largely of railroad signals, post office systems, requiring the use of structures of some kind, and other apparatus that have glass houses or canopies over them, while the American exhibit contains many dynamo machine and telephone and telegraph instruments, and collectively does not require the use of very imposing edifices to show them off to advantage. The Commissioners, however, "filled up the hole" by planting a high pole at each corner of the section and hanging a paper cornice around the span, supported at intervals between the high poles by shorter ones made up of bundles of signal service field telegraph poles, and the whole thing abundantly decorated with American flags and eagles. Although by no means proud of the small exhibit from our country, that *could* make such a great show, our patriotism is satisfied to some extent in the knowledge that visitors will have no trouble in finding us.

It is unfortunate that the subject of the Exposition was not brought before the last session of Congress, and an appropriation secured to cover general expenses. The money for the decorations and the expenses of the Commission was raised by an assessment levied upon the exhibitors of 30 francs for each square metre of space they use, which in some cases was quite a tax. There seems also to have been a lack of general information in America on the subject of the Exposition, which may account for our small delegation. Many thought that only electrical novelties were to be shown, and were ignorant of its general and historical nature. Prof. Gray, for instance, exhibits nothing but his harmonic system of telegraphy, while he could have filled a large room with his experiments and inventions, dating back over fifteen years. Edison, who had agents here, was in a position to be better informed, and fills up two rooms with his

productions. Everything he has invented is on exhibition, and his rooms attract much attention. Unhappily, they open off the gallery and are some distance away from the rest of the Americans, so that we do not get the full benefit of his presence.

The nave of the palace has been divided into two parts, one half being set apart for foreign exhibitors and the other for French. In these two divisions are conspicuous four large pavilions—that of the French Ministry of Posts and Telegraphs, which is the largest of all; that of the London Post-office, that of the city of Paris, and finally that of the French and foreign railways. In the middle of the nave, on the boundary line between the French and foreign divisions, an immense tower supports an electric lighthouse. At the foot of the door is a fountain and rockwork. By an ingenious method of lighting, the water is rendered luminous, so that the fountain spurts forth, as it were, liquid diamonds. One half of the building is glazed with common glass and the other half with black glass. In the latter section the electric light is introduced. Seeds of the same plants, planted in the same mold and at the same time, are exposed to the two forms of light, the sunlight and that of electricity, to see under which conditions they will grow the more rapidly.

One of the more noticeable inventions on the ground floor is the automobile safety barriers of the Austrian railways, which will fall as trains approach and recede. The electrical balloon, small and white, with its tiny sail has a dove-like appearance. Its flight appears uncertain, but its inventor believes that he has succeeded in greatly simplifying aerial locomotion and rendering it safe and certain. In the pavilion of M. Cochery, French Minister of Posts and Telegraphs, six operators, working a single wire, transmit six different dispatches, operating on little key-boards with five wire keys and with arbitrary signals. What they telegraph comes out printed, but the whole staff cannot turn out between them more than one hundred and twenty-five words a minute, which, as compared to the Edison apparatus, is as the old-fashioned slow coach to steam locomotion. An electrical machine operates in the Edison exhibit, which, manipulated by four operators, telegraphs at the rate of 1,200 words per minute.

Among other startling things in the British exhibit is the Muirhead quadruplex *in operation*. The American Union Company had two sets of these instruments, but, either from lack of skill on the part of our electricians, or for some better

raison, they never could be made to work.

From the galleries overhead float the blended banners of the nations, the Stars and Stripes, the Union Jack, the red, white and blue of France, the red, yellow, and black of Belgium, the yellow and red of Spain, the yellow and black of Russia; and strangest sight of all, the red, white and black pennon of Germany hangs for the first time in eleven years in peaceful friendliness beside the tricolor. The German flag was last seen in Paris on the lances of the Uhlans, as they rode down the Champs Elysées, ten years and more ago. Among the flags are set lamps shaded with ground-glass globes, that glow as pearls of flame with the imprisoned fire of the electric light.

The up-stairs galleries alone contain wonders enough to compose an ordinary exhibition. These galleries are divided into twenty-eight rooms, each of which is devoted to some special application of electricity, and each illuminated by a different system of electric lighting. In the nave all the systems of lighting operate simultaneously in producing a general effect; in the upper rooms the public is able to judge each system by itself.

The first of these twenty-eight rooms contains pictures and objects of art illuminated by Clère's sun lamp. The second has been transformed into a theatre. In this theatre the electric light is used for footlights. The scene shifting and lighting are done by electricity. A knob is pressed and a stage decoration is changed. On the first trial of the machinery there were some hitches, and a little girl had a narrow escape from being killed by the fall of an antique cross in a market place. Two rooms are fitted up to represent a complete French dwelling apartment or flat—salon, dining room, bedroom, kitchen, bathroom—in which are exhibited all the appliances of electricity to domestic uses. Vessels are raised from the pantry and let down by electricity. An electrical lustre is suspended over the dining table, and the marking board of a billiard table is worked by the same agency. It gets through the tasks of many servants noiselessly and with the precision of clock-work. The automatic electrical sewing machine of Olivier is very elegant and useful. It costs little, and the force generating the electricity can be provided to do ten hours' work at an expense of fifty centimes daily. While the seamstress holds the cloth she can, if she pleases, be noiselessly fanned.

Rooms 7 and 8 are divided into six elegant little salons. Wires put these salons in communication with the Opéra and Théâtre Française, and by means of telephones the performances of these two theatres are heard, even to the smallest details. The telephone does not lose any sound—the applause, the footsteps of the actors, nor even the noise of the moving of a chair. The only parts of the performance that the telephone cannot transmit are gestures of the actors and the scenery.

No. 9 contains electric and magneto therapeutic appliances; No. 10, fire alarms and Sauter & Lemonnier's lamps; No. 11, photography; No. 12, Gramme lighting system; No. 13, Siemens' lamps and instruments of precision; Nos. 14, 15, 13 and C, general and accessory telegraphy. The middle of the galleries contain various exhibitions—the display of the General Telephonic Company, incandescent lamps of the Heran Maxim system, Jaspar, Liège and Anatole Gérard burners and Thomassi lamps; No. 17 contains a collection of piles; No. 18, a retrospective exhibition of the instruments of Volta, Galvani, Armstrong, Ampère, etc.; No. 20, electrical clocks and time-keepers and Gibbs' lamps; rooms 19 and 20 contain a reading room and bibliographical exhibition, lighted by the Lontin and Daft systems; room D is a lecture hall, lighted by the Swan and Brush methods. The remaining rooms have been assigned to Edison.

The machines and apparatus on exhibition are not yet all in working order. Of course, there are many specimens of electrical architecture, such as primitive induction coils, old fashioned dynamo-machines, dial telegraphs, etc., that have all been described and laid away on the shelf years ago. They make their appearance now like things of the past come to mark the progress of time. Beyond having an historical

interest, they have little value. Among the number is the first telephone made by Philip Reiss in 1861, and described at length by Prescott.

On August 18 the Superior Committee held a meeting to organize a jury to make the awards. There are 1,800 exhibitors, of whom 600 are foreign and 1,200 French. In spite of this difference, the committee decided that the jury shall be equally composed of French and foreign members. Each section will, therefore, appoint a number of jurymen in proportion to the importance of its exhibit. The Committee decided to place at the disposal of the jury 50 gold medals, 200 of silver and 500 of bronze.

A fire, attributed to a defect in the fitting up of some incandescent lamps, broke out on Thursday, Aug. 25, in the reading-room of the exhibition. The alarm was quickly given and the fire was extinguished before it had spread far. In attempting to tear out the wires with his hand a fireman was twice knocked down. A scientific commission, headed by M. M. Du Moncel and Breguet, made an examination of the connections of the various exhibitors and there is now no further danger to be feared.

The experimental lighting up of the exhibition took place on the evening of Aug. 26, M. Gambetta, President of the Chamber of Deputies, being present. The combined illumination of all the various systems in the area of the Palace of Industry had not, contrary to expectation, a blinding effect. The spectacle, however, was very fine.

There is an electric lamp for about every square metre of space in the building. Admittance to the night exhibition costs 1f. 50c., and to the day exhibition 1f. Besides lighting up the grand staircase and his own section, Edison proposes to place a number of his incandescent lamps in some of the neighboring concert gardens in the Champs Elysées. It is not known whether his ramifications will extend as far as the Jardin Mabille, which is quite near, but it is hoped not.

A track has been laid for the Electric Railway, of which we have heard so much, from a point on the Place de la Concorde into the building, a distance of perhaps an eighth of a mile. In the German experiments both of the rails are used as conductors, and are, consequently, heavily charged with electricity. Horses and cattle, in crossing these tracks, sometimes receive very heavy shocks, and the trouble has become so serious as to take the form of a real objection to the use of the system. An iron rod has been hung on 12-foot poles along one side of the track from the Place de la Concorde. This rod is used as one of the conductors, a small car running along it, connected by a wire to the main car, which, in turn, passes the current into one of the tracks and the earth. This means may overcome the objection of having both rails charged, but it seems to be a cumbersome way of doing it.

One evening last winter an operator, who is at present employed at 195 Broadway, sought a bachelor's usual solace after dinner in his pipe. He packed the tobacco into the bowl solidly and stretched himself out for half an hour's quiet comfort. After the first few puffs the ashes in the pipe bowl had risen over its edge and were in danger of falling upon the carpet, when the smoker, not wishing to burn his fingers, and being a young man of expedients, drew one of those rubber-handled Western Union styluses from his pocket to pack the ashes down. He noticed that before the rubber touched the ashes small pieces of the latter flew to meet and adhered to it. He then remembered what he had read on the subject and saw that it was only an illustration of the old experiment that hard rubber and flannel rubbed together electrified the former so that it would attract light bodies. In pulling the stylus from his pocket there was friction enough between it and the flannel of his vest to charge the rubber and cause the above result. Our friend then performed several other old but interesting experiments with his stylus, and finally made up his mind that he knew all about it and laid it away. Like many other men, he did not know that the idea, properly developed, was worth a fortune to him.

There is on exhibition here a machine, just patented, called the Electric Middlings Purifier. It is designed to separate flour from the wheat shells after the bolting process has been gone through with. The residue, which consists mostly of the shells from the

grains of wheat contains also a good deal of flour which cannot be separated by the ordinary process. It is called middlings, and is sold for horse feed, and sometimes a low quality of bread is made from it. The Electric Purifier has seven cylinders of hard rubber revolving over a sort of tray, so arranged that the middlings gradually work from one end of the tray to the other and in the journey pass under each of the seven rollers. Over the upper side of each roller is fastened a piece of sheep skin with the wool side pressing against it. As the roller turns, the friction between it and the wool causes it to become electrified and as it passes over the middlings the light pieces of shell, being attracted, fly up to meet it and adhere to it until they reach the opposite side, when they meet a light scraper, which rubs them off. They then drop into a small slide and are carried away. The flour, being heavier, remains in the tray until the lower end is reached, when the impurities having been removed by some one of the seven electrified rollers it is run off and saved. The principle governing this process is exactly the same as that existing between the rubber handle of the stylus and the tobacco ashes. It has been suggested to the gentleman having charge of the purifier that cat's skin might be an improvement over sheep's skin for electrifying purposes. It presents the advantage, also, of being plenty, cheap, and of providing a use for cats.

#### The Telegraphic Situation—That "One Man in Charleston" Heard From Again.

When this paper ridiculed the stock-jobbing cranks who persisted in taking the Western Union monopoly—or consolidation, or whatever it is—into court, intending to break the bonds of consolidation in that unfair manner, and when we advocated new lines as the only legitimate way to compete for public patronage, we were sure that we had struck the key-note to the only scheme that could result satisfactorily to the commercial men of the country. The managers of the late American Union Company gave us some good lessons in the organization of telegraph companies, and, now that the invocation of the law has been wisely abandoned, the sensible portion of the "Anti-monopolists" has begun to profit by the teachings of Mr. Gould and his subordinates.

In the meantime some of the local managers of the Western Union seem to have done all in their power to promote the success of the embryo opposition. By attempted reductions of salary and increasing hours of labor, they drove some of their best men away, "cheap" ones being hired in their places, all of which has gone a long way toward alienating the loyalty of the operators and the confidence and patronage of the general public.

We have already reported the holding of public meetings to censure the Western Union service; we have reprinted extracts from the Atchison (Kansas) *Globe*, the Kansas City *Journal*, and other papers, all going to prove that if the company wants its telegraphing done satisfactorily to the public it must deal fairly with its men. We have now to reëcho the cry from far-away Utah. The Ogden (Utah) *Pilot*, of the 15th of August, says:

"We are reliably informed that the scarcity of first-class telegraphers is something unprecedented, and those Western Union managers who, under the new regime, have endeavored, in hiring third-rate men, to curry official favor by reducing expenses, now find themselves in a sorry plight, being unable to handle their business with anything like satisfaction to the public or the head managers at New York, and are being called to account therefor. The Ogden office is an exception to the above, good wages being the rule at this point. But at Kansas City and Omaha the "Hams" (telegraphic vernacular for poor operators) are in the ascendant and, through incompetent work, are provoking indig-

nation and unfavorable criticism from the press and the public."

From Minnesota we hear, through the St. Paul *Dispatch* of August 15, that

"A gentleman who has had a great deal of trouble regarding the transmission of his business between this office and eastern points, remarked to a *Dispatch* representative the other day that the Western Union Company pursued a very short-sighted policy in the management of their business at St. Paul. They have neither well-constructed lines nor men in their office competent to transact their business. They hire men at a small salary to operate their instruments, and the result is that every month they lose an amount of money sufficient to pay for almost double the force they now employ. \* \* \* The gentleman mentioned is connected with the press of St. Paul, and is the correspondent of the most influential eastern paper. Matter which he files in the early hours in the evening is frequently delayed, because of the state of affairs mentioned, until it is too late to forward it, and the company thus loses the business."

From the Montevideo (Minn.) *Leader*, of Aug. 14, we have:

"Three instances in view. The first, that of a telegram which was sent from Stillwater to St. Paul (20 miles) at 5 o'clock in the evening, asking for a fire engine to assist in saving a large lumber establishment in that city, which was on fire and threatened a conflagration. But, notwithstanding the fact that a city was in danger and needed prompt relief, the telegram, sent at 5 in the evening, was not delivered until 9 o'clock the next morning. The second relates to a case in this city where a child was very sick. The parents presented a message to the operator at this office about 6 o'clock P. M., and paid full rates in order that it might be delivered that night. It was urgent, and directed that a physician be surely sent the following day. Mark the result: The message was delivered the next day at 9:30 A. M., one and a half hours after the train left for Montevideo, although the operator assuredly states that the message was put through that night. The fault then was in the non-delivery of the message after its receipt in St. Paul. The third case is where a message was taken to the office in Granite Falls, Sunday week, to be sent to Minneapolis, informing a father of the death of his child and asking him to come by Monday morning's train. The sender was assured the message would be sent that night. Result: It was put through the next day in the afternoon. Now, we submit that this is an imposition as well as an injustice. A person may be lying at the point of death and the services of a physician be needed to save the life of that person, and yet if a telegram is handed in and paid for, with the understanding that it be immediately transmitted, it does not receive as much, and sometimes not the half, attention as a message announcing the decline or rise of the hundredth part of a cent on a bushel of wheat. The above cases are certainly in the nature of a breach of contract, and if there is no redress we would suggest the enactment of a law making such negligence, either upon the part of the company or the operator in its employ, a penal offence, punishable by fine and imprisonment, or both."

Even an English paper, *Design and Work*, says:

"The Western Union operators are beginning to envy their English *confrères*. The management are reducing pay and increasing the hours of duty, an insane step, which is likely to be prejudicial to the would-be monopolists."

Opinions, privately expressed in all quarters, are still stronger. Col. J. J. S. Wilson, late W. U. Superintendent at Chicago, and a pioneer telegrapher, in an interview published in the New York *Times* of Aug. 15, says:

"The Western Union has increased its force during the last few years, but there has been a tendency to give smaller wages and employ an inferior class of operators. The recent economy in Western Union, which, it was said, was to save a million dollars, and make up a large proportion of its dividends, I should judge, could only be effected by not keeping up the properties. Of course, inferior operators render a poorer service. That is inevitable. Besides, the tendency

to reduce salaries has created great dissatisfaction among the men."

A reliable correspondent, writing from Chattanooga, Tenn, says:

"Summer business here is usually light, with a reduction of force, but this year it has been very heavy, with an increase; and if it keeps up this winter, five or six men will have to be added to work the cotton business off promptly. Operators are very scarce in this part of the country, and the cry for first-class work in the South at \$75 per month does not seem to have the desired effect; and, consequently, the business comes in all manner of "bulled up" shape. In 1870 to '75 the salaries in this office were \$110 to \$125, and not enough business doing to keep a duplex working. Now neither the out-let nor the pay is sufficient. The majority of first-class offices have had the extra pay for extra service cut off, working men 16 hours out of 24 for \$75 per month—or, at least, \$90 men doing it with no pay (extra) because they cannot get men at \$75 to fill vacancies caused by those leaving to better themselves in Chicago, Cincinnati, New York and other places, where they have slightly increased, to fill up the force. For my part I think the winter business in the South is going to be a matter of lawsuits with the company during the whole season. Why not pay good salaries and get their old men back—men who know how to handle the business in first-class shape?"

Another responsible correspondent writes from St. Paul, Minn.

"Some of our best men have resigned and accepted positions elsewhere, at better salaries, and their places being filled by a very inferior class of operators, has been the cause of much dissatisfaction among the business men of this city, on account of unnecessary delays and inaccuracy. The local manager, Mr. F. B. Jilson, is in no wise to blame for this. He is deserving of considerable credit for doing as well as he has under the existing difficulties, as is also our worthy chief, Mr. C. B. Davison, for, since the "consolidation," business has greatly increased, and the force has been inadequate.

"It is impossible to obtain competent men at the present salaries, which are from \$40 to \$70. Among a force of 30 men, there are but 4 or 5 that receive over \$60. Ten hours constitute a day's work on the day force, and 8½ with 1 hour at noon, on the night force. Extra is paid for at the rate of 30c. per hour for all that receive below \$50 per month and 35 cents per hour to those above that amount. It will readily be seen that the man who works from 6:30 P. M. until 3 A. M., does not report for "noon relief" next day with a very cheerful demeanor to finish the work of the preceding day. It is true, the night force are paid extra for Sunday service, but as they work 57 hours for six days, against 49 elsewhere for seven days, there is good reason for complaint. While seeking a remedy for the existing dissatisfaction in Kansas City, St. Joe and elsewhere, I hope that General Eckert will not overlook the Northwest."

An Elgin, Ill., correspondent says:

"All old operators in this section are quitting the service and engaging in more remunerative employment, at least where their services will be appreciated."

From all the large cities there are complaints that operators are scarce, and that those employed by the several companies are compelled to do double duty—as an operator remarked the other day to a reporter of the Cincinnati *Enquirer*: "The company seems to be employing every amateur that can make the alphabet." This same operator said: "If the companies would pay living salaries they could get all the good men they need. The railroad lines now are paying fully as well as the Western Union, and as the work is much easier and living cheaper the best men are leaving the cities and going to the country towns, and the city offices are filling up with the poorer class of young and inexperienced operators. A great many first-class operators, too, have been driven into other business by the ruinously low salaries that the telegraph companies are now paying."

Another "old-timer" said to the same newspaper man: "Well, this won't last long. It

seems to me that telegraphic prospects are brightening. The business is growing so fast that capitalists will organize new companies. I think the Western Union has played out all the consolidation string they have, and the next company that comes along will come to stay. Do you know," said the expert, "that a telegram is an unknown thing in two-thirds of the homes in this city, and, in fact, in the country. One-half the business houses in Cincinnati never receive a telegram. They depend entirely upon the mails. Pretty soon they will all use the wires. No; I do not think that the outlook is so awfully discouraging. If the operators will only demand what they ought to have, they will soon be able to get it."

From personal assurances given us at headquarters in this city, we feel sure that the doings of these petty official swashbucklers are without authority, and if we find this to be a correct surmise we shall point them out by name. Meanwhile the fact stands that they have fooled not only themselves but their superior officers, and they had better resign.

### Telephone Transmitter Batteries.

Telephone exchange managers, young and old, experienced and inexperienced, have had an interest in the question: "What battery is, under ordinary circumstances, best adapted for the operation of a battery telephone?"

The two battery telephones in common use, as is well known, are the Blake and Edison transmitters. The question is a serious one to all, and in various forms it has constantly been repeated during the three past years of the exchange business.

This exchange business, this little giant of the Western hemisphere, has, no doubt, been the cause of a tremendous boom in the Leclanché battery.

This battery was the first one to suggest itself as being most eminently suitable for transmitter work. Its comparatively high electromotive force, or vim; its cleanliness; its freedom from corrosive acids and chemicals, and its longevity, all contributed to render its claim to notice a powerful one.

It was at once installed as the transmitter battery par excellence; its virtues were legion, and its faults few and insignificant.

The months flew by and the managers and superintendents of small exchanges found themselves in charge of large ones, for the business, under the influence of popular necessity, had grown like the remarkable beanstalk of the fabled Jack, and the expense began to be a factor.

It was then discovered that the Leclanché had some faults, after all. It was expensive in first cost; it would soon become weak if used more than a few minutes at a time; it would, sometimes, without any apparent cause, get a very weak back and prove itself to be unable to do its work; it would corrode its own wires, and so on, *ad libitum*, to the end of the melancholy chapter.

It was the old, old story; from one extreme the telephone expert had jumped to the other, and the battery that at first had no serious drawbacks, now was nothing but one gigantic fault.

Many persons undertook to experiment on transmitter batteries for themselves, with results more or less successful.

One eminent electrician made a battery by filling a porous cup with a mixture of chloride of lime and crushed carbon round the carbon plate, sealing this mixture up and immersing the whole in a solution of common salt.

He reported that the battery so made worked satisfactorily. But I would not recommend it for general use; it is apt to be disappointing.

Another man, ascertaining from electrical text-books that peroxide of lead was a better

depolarizer for batteries than the peroxide of manganese, and finding out that De La Rive had experimented with it, forthwith jumped to the conclusion that he was the discoverer of this great fact in physics, and constructed, with immense enthusiasm, a battery using the said peroxide of lead, combined with carbon, as the mixture to be placed round the rod of carbon in the porous cup. In course of time comes the chlorine battery inventor, describing his battery with a profundity of chemical symbolism, and displaying a marvelous knowledge of chemical nomenclature. This invention was backed by Prof. Carhart and ought to have succeeded, but it cannot be denied that it has so far fallen flat, after a short but vivid coruscation.

Soon came another battery, aspiring to the favor of telephonists. Surely in this the force of simplicity can no further go; for this cell has no porous cup, has no depolarizer, but consists simply of two opposing plates immersed together in a solution of sal ammoniac.

This is now well known by the name of the "Law Battery," because introduced and manufactured by the Law Telegraph Company, of New York.

It possesses several well-defined advantages, chief among which, as previously indicated, is its simplicity of construction. Its extreme cheapness is also noteworthy, since it only costs \$1.25 per cell complete, subject to discounts in quantities, and somewhere about 10 cents per cell per annum for maintenance.

The cover is tightly attached, so that evaporation, or creeping of the saline solutions cannot ensue, and yet the cover can be easily put on and off at pleasure, as the sealing is effected by a rubber ring placed around the neck of the jar, over which the cover fits tightly.

It is said that the connections have never been known to corrode, and as they are exposed to view, it has been an easy matter to determine the question.

As yet no fault, it is stated, has been found with the battery, and, judging by the large number of cells which, reports say, have been sold during the brief time it has been before the telephone public, it is growing in popular favor. Nearly all of the exchanges in the country are trying it experimentally, and many, it is said, have adopted it exclusively.

Some enterprising persons and electricians, acting upon the suggestion of J. T. Sprague, the English electrician, have endeavored to prove the Leclanché patent invalid, but there is no sufficient ground for such an assumption.

The Leclanché battery, claiming the use of peroxide of manganese when moistened by a liquid containing a salt in solution which has no chemical action upon the manganese, the manganese to be in a porous cell, was patented April 23, 1867, and has, therefore, three years still to run. It was re-issued with much broader claims on February 17th, 1874, and the patent for the Leclanché prism battery was granted July 13, 1875. This has still eleven years to run.

After the revolution already recorded against the Leclanché battery took place, the inevitable reaction set in, and it is once more regarded as a very fine battery—and by many, indeed, the best, all things being equal—for a battery transmitter.

On the score of economy, I am disposed to regard the prism form as the most desirable, as dispensing with a porous cup.

I will here give, for the benefit of the uninitiated, a short description of both:

The Leclanché cell, ordinary form, is simply a plate of carbon set in a cup of porous earthen ware, and surrounded with a mixture of peroxide of manganese and granulated carbon. When full, this is sealed up by a resinous cement. The carbon plate sticks up through the cement, and is fitted with a cap of lead, surmounted by a binding screw, for connection to the circuit wire. Two holes are made through the cement.

The porous cup, with its contents, is then placed in a glass jar, which is filled to the shoulder with a saturated solution of sal ammoniac; while in one corner of the glass jar stands a rod or pencil of zinc, fitted with a spiral connecting wire, which forms the negative pole. This, then, is the ordinary form of the Leclanché battery. The object of the peroxide in the porous cup is to prevent polarization by absorbing the hydrogen produced by the galvanic action; the object of the pulverized carbon is to increase the surface

of the carbon plate, and likewise to assist the manganese in its work, by presenting a number of salient points to work on. A cap of lead is placed on the carbon in order to form a good point of connection with the conducting wires, and the holes through the sealing mixture are provided for the escape of any gases that may generate in the porous cup.

To set up the battery, take about four ounces of sal ammoniac, put it in the glass jar, and fill the jar one-third full with water. Stir it up, pour about a tablespoonful of the water and sal ammoniac into the holes of the porous cup, then put the porous cup into the glass jar and fill it to the shoulder, never higher, as the dryer the contents of the porous cup are, the better they will work. Put in the zinc, which should always be of rolled metal, and the cell is set up.

The Prism cell is somewhat different in construction, although the principle is identical. In it, instead of surrounding the carbon plate with a mixture of granulated carbon and peroxide of manganese in a porous cup, the depolarizer is formed of a mass composed of equal proportions of peroxide of manganese and granulated carbon, the whole held together by the introduction of from five to ten per cent. of some cementing substance, such as resin; the carbon plate is inclosed in this mass, and the entire substance is subjected to hydraulic pressure in a hot mold. The zinc in this battery may be of any desired form.

The zinc forms one pole and the mixture the other. Both are fitted with screw connections, and immersed in a solution of sal ammoniac in the glass jar. This style is to be preferred, and is not so expensive as the other. In the use of the Leclanché battery in any form, care must be taken that the vapor of ammonia does not eat away the conducting wires.

An occasional lookout should be kept for the formation of white lead between the carbon and its lead cap. If the battery fails to get up strength, ram a small screw-driver through the holes in the sealing mixture and see that they are clear. It frequently happens that they become stopped up and the gas cannot escape.

If the battery be used in connection with a magneto bell, care must be taken that the wires are so connected that the circuit is completely opened when the telephone is hung up. It is also well to look out that the wires from the battery do not cross any damp place, otherwise a cross connection may occur, the effect on the transmitter being diminished, causing a bitter war from the suffering patron of the telephone.

If the battery be in a warm place, the solution soon evaporates; therefore, don't put it in a warm place if you can help it; but if you can't help it, do your best to make it air-tight and inspect frequently. In places where the transmitter is to be continuously employed use a blue vitriol battery.

To sum up, the two best batteries for telephone transmitter purposes at present before the public seem to be the Leclanché and the Law. As between these two opinions differ. For burglar alarm purposes, electric bells and the like, the Leclanché is undoubtedly preferable, and as a telephone battery not inferior to the Law. The Law battery, however, is the result of long and patient experiments on the part of the Law Telegraph Company to arrive at the best, simplest and most economical battery by telephone use, and ought to be accorded a fair trial for telephone exchanges. Those who use either the Law or the Leclanché will not be far astray. It would do no harm, however, for exchanges who have heretofore used neither or only one, to give both a fair and equal test. By this means they will be better enabled to arrive at a proper conclusion as to which of the batteries best suits the particular requirements of their exchange. T. D. L.

#### Progress of Opposition Companies.

Mr. J. D. Flynn, prominently identified with the Baltimore & Ohio Telegraph, recently said, in answer to the inquiry whether it was a fact that the Baltimore & Ohio was soon to establish its own telegraph system, "Yes, and we expect to be ready for business within 60 days, or as soon as we can make the necessary arrangements. We have already over 1,200 miles of wire in operation, and could establish a very respectable

business as it is. These lines extend to Chicago, and were being extended through to St. Louis when we were interrupted by legal obstructions at Vincennes. We are now pushing on beyond there, and have material distributed along between 20 and 30 miles on the railroad beyond that point. We shall run other lines to Chicago by way of Peoria as soon as we get the St. Louis connection effected. Our most important business yet in establishing our lines is to reach New York City, and this is well in train. That done we can open up whenever we please. Cleveland and Toledo will naturally be touched later, being too important business points to be left out. When the machinery is fully in operation we shall push out in different directions and form a complete system. It is not a bubble blown up to sell out. You may be sure of that."

With regard to the other companies, the Mutual Union seems at present to be the only dangerous rival. That company is making tremendous efforts to open up some time in October, so as to catch a share of the fall trade. A circular issued by them says that their old line, between Boston, Mass., and Washington, D. C., has been fully equipped, passing through the cities of Providence, Hartford, New York, Philadelphia and Baltimore, with connections from the main line to Newport and Springfield, Mass., Newark, N. J., and Wilmington, Del., a small link of the Newark line being not quite finished. The extension of the company's lines which was contemplated four months ago, and for the building of which bonds were subscribed, is under construction, and the rapidity with which the work is being prosecuted bids fair to promise that the entire line between New York and Chicago, by way of Albany, Buffalo, Cleveland, Toledo and Detroit, will be open for business by the early part of October; another line will connect Boston with Albany by way of Springfield. A contract has been made with the Chicago and Milwaukee Telegraph Company for the use of their poles between Chicago and Milwaukee, and it is expected that the new lines which are being built between Milwaukee and St. Paul, and Chicago and St. Louis, by the Mutual Union Telegraph Company, will be finished simultaneously with the line from New York to Chicago. A southerly line has also been surveyed between Washington and Chicago, by way of Cumberland, Wheeling and Pittsburg, including Cincinnati, Zanesville, Columbus, Indianapolis, Terra Haute and Vandalia, and is being rapidly pushed toward completion, so that it is confidently expected that the company will have two independent routes to the West ready for service within the next ninety days. A contract has also been made to extend the company's lines from St. Louis to Kansas City, and it is thought that they will be built before the approach of winter. A connection has also been made from Boston to Bangor by way of Portland, and that line is to be completed by Nov. 1.

As a matter of interest, to show how rapid the construction of the company has been carried out, they call attention to the fact that up to date there have been built 2,000 miles of pole line, one-half of which was erected during the months of June and July; and Mr. Walter Katté, the engineer of the company, reports that construction is progressing at an average of over 500 miles a month, and adds that "upon the poles already erected there have been strung more than 10,000 miles of wire."

The Postal Telegraph Company seems to do little but beat gongs, and we are not sure that its ultimate objects are genuine. The name of its speculating president, James R. Keene, does not seem to inspire much confidence in financial circles, although the same might have been said of Jay Gould in connection with the late American Union. But, taken all in all, the impression seems to prevail that there is a colored gentleman concealed somewhere in this Postal Telegraph wood-pile.

It has recently been rumored that a combination of interests has been entered into between the Mutual Union, the American Rapid, the Canadian Mutual, and the Baltimore and Ohio Railroad systems of telegraph lines. It has also

been stated that the Mutual Union was seeking to form a union with the Postal Telegraph Company, James R. Keene's organization. It is understood that bankers interested in the Mutual Union Company have suggested to the Postal Telegraph Company the idea of a combination which would make only one great opposition system to the Western Union. No formal negotiations, however, can be said to have been entered upon, and some members of the Mutual Union Company reject the idea of association with the Postal Telegraph Company until it has brought forth works meet for consideration. As to the other negotiations referred to, it is stated authoritatively that nothing has yet been settled, and that no details of the negotiations can be given at the present moment.

An officer of the Mutual Union said: "So far as we are concerned, the Postal Telegraph Company is a myth. It is easy enough to organize a company on paper; it costs \$15 and the rent of an office. We know that the Mutual Union, the Rapid, and the Baltimore & Ohio Company have lines and property, which the other company has not. You might as well talk of consolidating an elephant with a butterfly as to talk of the Mutual Union being absorbed by the Postal Telegraph. Moreover, the Mutual Union will never be consolidated with any company—will never be absorbed—never. You can state that fact in as emphatic terms as you please.

"We have been negotiating with the Rapid Telegraph and the Baltimore and Ohio Companies for a combination of interests. But the negotiations are not yet completed, and if much publicity were given to them it might work us an injury. The probabilities are that they will end in what will be an absorption of the Rapid and the Baltimore and Ohio systems by the Mutual Union. I know that Mr. John W. Garrett is opposed to surrendering the control of any of his property, but we have got the promise of an alliance with the Baltimore and Ohio system, on terms to be arranged subsequently."

Regarding the progress of the Mutual Union's lines, it was stated that the company is preparing for the construction of 500 miles of line in Maine. The Canadian Mutual Telegraph Company is being organized in Canada for the purpose of extending the lines of the Mutual Union throughout the Dominion. The lines from the East to Chicago, St. Paul, St. Louis and Kansas City are nearly completed. The company has about sixty gangs of men at work on the lines, and is said to be building at the rate of 1,000 miles a month. A separate southern line from Washington to Chicago is nearly two-thirds finished. It will tap Frederick, Maryland, Cumberland, Pittsburgh, Cincinnati, Indianapolis and Springfield, Ill.

"We do not propose," continued the gentleman above referred to, "to open our lines to only a few places at a time so that the Western Union will be able to beat us in detail by reducing a small proportion of its rates. We shall take our time, and when the opposition system is opened it will be over a very considerable portion of the United States. Then, if the Western Union wishes to fight us, it will have to reduce its rates so as to affect a very wide area. As for us, we do not wish to slaughter rates. The Mutual Union is a business enterprise, and it will seek to obtain profitable returns."

Referring to the above, a gentleman connected with the Postal Telegraph Company, in answer to inquiries, said:

"All I can say is that we are going to furnish the people of the United States with cheap telegraphy, and it will only need the building of our experimental line from New York to Chicago to demonstrate our ability to do so. We are about to close contracts for the building of that line, and I will warrant that it will be completed in a shorter time than any other line of its distance was built in. With that line finished, and the merits of our system proved, it will simply mean that our company, in a year from next January, will have its wires all over the country. The Chicago line will be finished by next January. We intend to make our rate to Chicago 25 cents for 20 words, against 50 cents for 10 words by the Western Union, and we can make a profit at that rate. We never offered to consolidate with the Mutual Union Company. We have refused offers of union from bondholders interested in that com-

pany. In fact, the lines of the Mutual Union would be of no value to us, for we could not furnish cheap telegraphy to the public over them.

"The Postal Telegraph Company proposes to construct immediately its trunk line of telegraph from New York to Chicago, composed of two compound steel and copper wires, with a resistance of only two ohms and three ohms to the mile, respectively, and equip them with the Leggo Automatic and Gray Harmonic systems. One thousand words per minute can be sent on each wire in opposite directions simultaneously."

#### A Clearing-House System for Telephone Exchanges.

A satisfactory telephone service is almost wholly dependent upon the central office. The more perfect the system for manipulating the calls of subscribers at that point, so in proportion is the service more satisfactory. The public already recognize the telephone as not only a great convenience but as an absolute necessity. They are willing to pay what many of them consider an exorbitant rental for its use, but at the same time they demand in return, not only good service but, as far as possible, a perfect one.

It is generally acknowledged that the service in cities where large exchanges are operated is deficient, inasmuch as a subscriber is forced to wait (usually with ear at telephone) for a connection with the person desired until patience ceases to be a virtue, and opinions of the telephone and of the management and operators, not at all complimentary to either, are indulged in. All this is no fault of the telephone (thanks to Professor Bell), neither that of the system of wires, although often anything but first-class, but more particularly to the system prevailing at the central office for answering calls and the proper distribution and attention after being received.

Improvements in Central office apparatus, more particularly switch-boards, have been made and adopted whereby the time necessary for answering calls has been greatly reduced. Connections between subscribers upon any one board or section under control of a single attendant can be made in acceptable time, but in the case of subscribers whose lines are located upon different boards the reverse is equally true. The greater proportion of calls being of the latter class, it is necessary to render the systems more perfect in such detail as pertains to this class of communication, which is termed "trunk" or "cross connections."

The methods of communication between the attendants of different boards or tables at present in vogue are: First, by word of mouth; second, by slips of paper, and third, by a telephone circuit.

The first named is objectionable, as it creates a continual hub-bub and confusion, also great liability to error. The second, that of using a slip of paper bearing in pencil mark the number or name of the subscriber calling and the one desired, also the number of the strip upon which the connection will be made, is an improvement upon the first, but is not perfection, as actual use attests. The slip, after being properly filled out by the attendant, is placed upon a "file," there to await the arrival of an office boy for transportation to the table or board connecting with the subscriber desired. Any one who has served a few years in a large telegraph office is well aware that office boys, as a rule, are not gifted with "high velocity." Their work, to them, has the stamp of monotony, and they get imbued with the idea that when one message is removed from a "file" another, Phoenix-like, will replace it when their backs are turned. Relying, then, upon this method, it is natural to infer that more or less delay will arise at this point.

The third, which is communication between the attendants of the several tables of an exchange

by telephone, is comparatively of recent date and not thoroughly tested as yet, but would seem to entail unnecessary extra labor upon the attendant.

A new and novel method of communication between the tables or boards of an exchange has recently been devised and patented by Mr. W. H. Sawyer, of Providence, R. I. It is called the Clearing-House system and may be briefly described as follows:

A space sufficient for an ordinary sized desk is selected near the centre of a group of boards or tables. Communication between the tables and the Clearing-House is obtained by means of tubes (preferably of paper to lessen the noise) about 1½ inches in diameter and slightly inclined.

The inclination, which is ½ of an inch to the foot, more or less, is amply sufficient to insure the rapid passage of a ball through the tube.

The balls, which are about one inch in diameter, of suitable material, such as ivory, or even wood coated with a silicate preparation, have three flat surfaces near together, made by grinding or cutting. The letter designating the table to which they belong is also painted upon the ball near the flat surfaces. The method of procedure is as follows:

Subscriber No. 15, located on table A, desires to communicate with subscriber 375, located on table H. The attendant at table A, upon receiving this information from subscriber 15, takes from a tray or box at the left one of the balls, and with a pencil places upon the surfaces (15)-(375), the figure 2 denoting that the connection will be made upon strip No. 2.

This ball is then dropped in a hole in the surface of table A at a convenient point, from whence it rolls by gravity to the Clearing House; time consumed, from 2 to 4 seconds, depending upon the distance. The clerk at the Clearing House at once picks up the ball and examines it. He understands it is intended for table H, as all subscribers between 350 and 400 are connected with table H. In 2 or 3 seconds it reaches table H. The attendant at table H picks it out from a tray or shallow box and comprehends at a glance that subscriber 375 is wanted on strip No. 2. Subscriber 375 is thereupon called up and informed that subscriber 15 desires to communicate. The ball is then marked with an X, or any pre-arranged sign or character, and dropped in a hole in the surface of table H, which communicates with the Clearing House.

The clerk at the Clearing House noticing the X, or that the ball is marked denoting that the connection has been made, places it in a tray in front of him which is also in front of a check clerk, who picks out the ball and makes the desired entry on a check sheet or book, to the effect that subscriber 15 has conversed with subscriber 375.

The pencil marks are then erased with slight moisture by the check clerk and the ball returned to table A by simply dropping it in the tube leading to that table.

In case subscriber 375 did not respond to the calls, a different prearranged mark would be placed upon the ball by the attendant at table H and the ball returned to table A, the connections on the strip 2 straightened, and subscriber 15 notified of inability to raise 375. In case of line trouble, the ball could be marked in some other prearranged manner, and by means of a tube from the Clearing House to the Inspector's Department, proper notification of such trouble could be thus promptly transmitted.

It will be seen by the foregoing description that the proper delivery of the calls by this system is controlled by gravitation, as against boy-power and will in the ticket system.

A ball must reach its destination in from 10 to 12 seconds, and not only is this true in one instance, but invariably so. A ball once dropped in the hole cannot go astray, drop on the floor or be blown away.

No office boys are necessary. The salary of an office boy is not large, but half a dozen in an exchange are a decided expense.

With a properly arranged exchange in other respects, not a word need be spoken, and above all every call has a certain successive order which of itself would be a satisfaction to subscribers to whom the fact was communicated.

The check sheet kept by the clerk at the Clearing House affords complete information regard-

ing the absolute number of connections made for every subscriber.

This is a valuable feature.

One fact greatly in favor of its adoption is the small expense attending its introduction; the paper tubes and balls costing but a small sum.

Mr. H. B. Lytle, General Manager of the Telephone Despatch Co., Boston, is now testing Mr. Sawyer's system with a view of adoption.

#### Free Advertising for Telegraph "Colleges."

The following appeared recently in the Cincinnati *Enquirer*:

"A dispatch from Wall street on Thursday said: 'The Western Union Company say they have more business than they can handle, and are short fifty operators at their main office here.' A prominent telegrapher in Washington says: 'I guess it is so, and that the Western Union were about as bad off in the West as in the East, as a great deal of Cincinnati business lately was being delayed at Washington.' Another telegrapher attributes the 'unfinished business' to a lack of operators, and looks for an advance of salaries."

On the following day there appeared in the *Enquirer* an advertisement as follows, with, of course, the name of the "college":

**A.—YOUNG MEN—**To learn telegraphy; operators wanted all over the country; see yesterday's (Saturday) *Enquirer*, fourth page, sixth column.

As well as being cruelly misleading to our rising youth, this coincidence proves that the Cincinnati *Enquirer* gives twelve lines of free puffs for five lines of paid "ads."

The interest the paper seems to have taken lately in parading before the public the scarcity of operators, increased wages paid, etc., would lead us to believe that there is a close connection between the *Enquirer* office and the "college."

The Trenton, N. J., *Daily Emporium* gives us the following:

"Wanted—Young men and ladies to learn telegraphing. Instructions given at residences when desired. For terms, etc., apply to J. K. Sutphen, 35 Copper street, for one week."

The *Emporium* sustains its grandiloquent title by giving only a little puff for a little advertisement—five lines of each.

Our next telegraph "college" advertisement is taken from a paper supposed to be interested in the welfare of railroad men. It states that, "knowing the demand for young men's services as telegraph operators, the advertisers—though they don't give their names, but only that of the school—have opened a school for the thorough instruction of telegraphy, and a complete knowledge of all its branches connected with commercial and railroad business."

This is supplemented by both editorial and general notices, one of them three-quarters of a column long.

It is gravely stated that "good telegraph operators are, at the present time, in great demand all over the country, and with the rapid increase in railroading, it is probable that the demand will not be supplied for many years to come;" and that there is "not a railroad in the United States to-day that does not most seriously suffer from the lack of competent operators;" that "we have the promise that any young man or boy of average intelligence and good habits, who enters the school and avails himself of the course of instruction, may at the end of the term feel reasonably certain of a good appointment," and that "there are but few boys or young men, ambitious to succeed in life, who may not easily command a sufficient sum of money to complete a thorough education in telegraphy, especially where it is reasonably certain that they will at once, upon the completion of their education, step into positions, the salaries of which will quickly enable them to return the money where it was obtained."

All this, as well as proving how politely the spider may invite the fly into his parlor, proves also that the enterprising journal from which we copy the advertisement can outbid the *Enquirer*,

by giving a seventy-two-line puff to obtain a nine-line "ad."

As a matter of fact, nothing could be more misleading than the statements quoted, a fact which is illustrated with grim satire on another page of the same issue containing the advertisement where, under the title "Railroading in Colorado," its own correspondent says: "Operators are thicker than politicians at a ward caucus. Wages are no better than East. Brakemen get only \$60.00 a month and telegraph operators all the way from a free lunch to \$50.00 a month."

From this showing alone those whom the paper advises to learn telegraphing may make \$10 a month more by learning to twist a brake scientifically.

The story that "operators" are scarce is literally true—the craftiness is shown in concealing the fact that such "operators" as are turned out from these schools are, as the correspondent above quoted says, "thicker than politicians at a ward caucus," and working, according to the same classical authority, for a salary estimated at "all the way from a free lunch to \$50 per month." The science of telegraphing is now about as near perfection as it ever can be, and while operators of a low grade, such as bear "college diplomas," are to be found starving, the superior class of manipulators, owing to the short-sighted policy of the companies in reducing salaries and the like, are extremely scarce, and will be until the "economical" mania wears off and fair salaries are again paid for first-class work. To attain this standard requires from two to five years' steady practice in a large commercial office. The ranks are being continually recruited from the better class of office boys and messengers, who literally absorb the mysteries of the craft in their tender years, grow up with the business, and attain a degree of proficiency which no college student can ever expect. Another peculiarity of telegraphing is that not one man or woman in a hundred who commences to learn it after the age of twenty-one years can ever hope to be worth \$50 per month to any telegraph company. At that age they might as well attempt to learn the piano-forte and become star players.

In the matter of salary, telegraphers are proverbially badly paid. Considering the exhausting labor, the long hours, and the patience, skill and intelligence which are indispensable for the proper administration of even a small telegraph office, there is scarcely a business in the world which is so poorly remunerated. Even in places where there is a large telegraph patronage, the salaries are surprisingly low. The railroad operators are even more poorly paid. For the double duty of acting as train dispatcher and operator, and putting in twelve or fifteen consecutive hours' work daily, only \$30 per month is paid by one of the largest Eastern railroads.

Now, if these wily advertisers would only be truthful we should not complain, but when they speak glowingly of "superior situations," "\$100 a month," "\$50 a month," and other absurd statements, we protest, as much in the interest of their prospective young and inexperienced victims as in the interest of our sadly abused profession.

The following resolutions, signed by a number of operators, gives a glowing account of the school above referred to, and is well worth reading:

*Whereas*, This school, presumably, seeks to create false impressions among young men, boys and others, as to telegraphy and its real condition, for the purpose of securing a pecuniary profit to the proprietors who actually offer the supposed prominence of their positions as full or partial guarantee of employment, whenever the student becomes more or less familiar with the art, and

*Whereas*, We possess official statements from various railroads centering in this city, showing that where one vacancy occurs, ten or fifteen applications for positions in the telegraph service are received; and

*Whereas*, Telegraphy is overrun with cheap telegraphers, just expert enough that salary is no object to them, making the business less profitable than any other pursuit requiring equal qualifications; and

*Whereas*, Throughout the United States and Canada, all the large cities contain one or more schools, colleges and places of this kind, where

telegraphy is "taught," and every month countless numbers of their victims are sent adrift; but where one succeeds in getting a situation, however simple, he is compelled to learn over again or become a common nuisance on the wires, interrupting and delaying business, regardless of its import; therefore,

*Be it Resolved*, That we, the undersigned telegraphers, actuated by a proper feeling of concern for the future welfare and standing of the occupation we follow, as a means of livelihood and the support of those dependent upon our exertions, with a considerate sense of justice toward the public, offer this testimony, confirmed by the number of years' practice and observation shown opposite our respective names, that we fully recognize and respect the right of persons to engage in any legitimate business, for profit or other advantages to be derived therefrom; but that bartering in positions, and deceiving, intentionally or otherwise, so that it results in personal gain, is not right or legitimate; and, further,

*Be it Resolved*, That we call on the fraternity at large and friends everywhere, to use all honorable means in their power to abolish this reckless teaching of telegraphy; and refuse all patronage, and as far as practicable, endeavor to curtail the circulation of any paper, pamphlet or circular offering free encouragement to such illegitimate practices. And further,

*Be it Resolved*, That our object is not to injure or intimidate, but to arouse the fraternity and the public to an appreciation of the magnitude and dangers of this constantly-increasing evil; that people trusting business, property and life in the hands of irresponsible boys, who have spent two, three, or four months in a "telegraph school" shall know that the proprietors of said "schools" are responsible for the present unsatisfactory condition of telegraphy, and the loss of life and property resulting from the inexperience of their students.

#### Consolidation in Canada.

On the 19th ult. it was announced here that the amalgamation of the Canadian telegraph companies, under a guarantee of 8 per cent. to the Montreal and 6 per cent. to the Dominion companies, by the Western Union, had been completed by the President of the latter signing the agreement transferring all interests to the Great Northwestern Company, whose head office is now in Toronto. This consolidates all the telegraph interests in Canada. When this project was first proposed it was met by the keenest opposition, and because the Western Union Company, which controlled the Dominion line, was a party to the arrangement, a patriotic outcry was raised against American interference in Canadian institutions. Boards of Trade in various cities were summoned to protest; the Government was called upon to intervene, and, finally, the courts were appealed to and granted an injunction. The real cause of the outcry was, it is alleged, the prospect of an ending to the low rates which permitted the uniform transmission of ten-word messages, irrespective of distance, for 20 cents; night rates from Montreal to Chicago, 1,500 miles, for 25 cents, and press reports, 500 miles, for 10 cents per 100 words. By limiting the increased tolls to 25 cents for 10 words, the press rates to 25 cents for 100 words, guaranteeing the stockholders a fixed dividend of 8 per cent., and satisfying the Government that the new arrangements would be under Canadian management, public apprehension was quieted and the legal difficulties surmounted. The consequence will be that the Western Union Company will have its revenues increased at least \$100,000 per annum and virtually control the entire telegraph system of British North America. It is a condition of the agreement that the charge for ten-word messages in Canada shall not exceed twenty-five cents, except in case a specific par-

liamentary or local tax should be levied, when the rate would be liable to increase in proportion to the amount of taxation.

This must undoubtedly prove a valuable addition to the Western Union system. The last annual report of the Montreal Company shows that in proportion to the population in extent of territory, no country possesses telegraphic facilities equal to those of the Dominion. There are nearly 25,000 miles of wire included in the combined companies, 17,000 poles, with 2,500 offices. The combined capital invested is over \$3,000,000 and the total receipts last year were \$750,000. The company under which the consolidation has taken place is the Northwestern of Canada, of which Mr. Erastus Wilman, of New York, is President. The company owns lines extending through the Northwest territory and is now in treaty with the Canadian government for assuming lines hitherto controlled and operated by the government, but without profit. The extent of the system may be measured by the fact that the wires of the company cover an area almost as large as the United States.

#### Underground Telegraph Lines.

In the annual report of the Engineers' Department of the District of Columbia, recently issued, considerable attention is given to the above subject. The following is a synopsis, which will be of interest to OPERATOR readers:

There are now in the city of Washington 41 miles of telegraph lines, consisting of 1,266 poles, carrying about 336 miles of wire, in addition to telephone and fire alarm wires carried over the tops of the houses, and estimated to amount to 100 miles of wire.

The use of underground telegraph lines is no untried experiment. No telegraph pole is to be seen in London, Paris and other great cities, and there are to-day more than a thousand miles of underground line and 30,000 miles of underground wire in successful operation in Europe. No doubt, therefore, exists as to the perfect feasibility of the system. It is true that the expense is greater than in the system of carrying the wires on poles, but it is a question whether the streets shall be any longer disfigured on account of this expense.

The cost of changing the existing wires from the poles to underground pipes, it is estimated, could probably be brought within \$8,000 a mile for a line of 40 conductors, with a reduction of \$185 for each conductor less than 40. In Paris the cost of pipes and labor has amounted to \$2,350 per mile, and for wires laid in cables of seven conductors each \$103 per mile for each conductor. When laid in the sewers, as 80 miles of underground line are laid in Paris, the wires are placed in seven conductor cables, and inclosed in lead tubes which are attached to the sewers by iron staples, the cost of the cables and the lead sheathing is \$130 per mile for each conductor, and of attachments \$90 per mile for each cable. For the ten miles of the trunk necessary for the present telegraph business of this city the total cost would, therefore, be \$80,000. This expense is to be divided among several companies, and it might be partially reduced by remitting for a term of years the taxes due on the property of the companies. It is, however, a question whether the streets and trees shall be sacrificed to the telegraph lines, and no question of cost ought to allow that question to be decided against the streets. We have 120 miles of shade trees, containing over 50,000 trees of twenty-two different varieties. Ten, or even five, years hence the beauty of these long lines of trees will be world famous, for no other city in the world has anything to compare with them on its streets. To allow the beauty of the streets to be destroyed by unsightly poles and wires, or to allow the trees to be injured for the benefit of the telegraph business, ought certainly not to be permitted. The work of removing the poles should, therefore, be undertaken at once.

#### The Electric Light—Maxim vs. Edison.

The Commissioner of Patents, to whom Mr. Edison appealed, has finally affirmed the decision given by the Examiner of Interferences and Examiners-in-Chief, in favor of Mr. Maxim, one of the electricians of the United States

Lighting Company, in the case against Mr. Edison, involving the celebrated platinum lamp.

This invention, involving a combination of a thermo-static regulator with a platinum lamp, is the one which was heralded in April, 1879, as the invention of Mr. Edison, which was to effect a complete revolution in illumination. The result of it was for a time very disastrous. The gas stocks were greatly depreciated in value, not only in this country but in Europe. In this country the value of gas stocks was estimated at that time at \$400,000,000. The decline in those stocks in both countries may safely be estimated at not less than \$50,000,000. On the other hand, the stock of the Edison Company shot up from \$100 a share to \$4,000. Maxim and Edison both claimed priority of invention. The claims of the rival inventors were thereupon submitted to the Examiner of Interferences, and after a thorough investigation he decided, Feb. 6, 1881, in favor of Mr. Maxim. Mr. Edison appealed to the Examiners-in-Chief, and they also declared in favor of Mr. Maxim. Finally Mr. Edison appealed to the Commissioner of Patents, and he affirmed the decision of his subordinates. This decision ends the final appeal in the Patent Office, and the practical result will be that a patent will issue to Mr. Maxim. A United States Court can now be invoked to cancel the Edison patent.

The Edison people say they do not use the invention now, and that it is a dead issue anyhow; while officers of the triumphant company say that they really enjoy the glory of defeating Mr. Edison, even upon a dead issue.

The philosopher of the *Detroit Free Press*, in referring to this subject, very aptly says: "Obviously the regulator was intended to regulate the currents of electricity so as to preserve a uniform intensity of light. Maxim invented it for this purpose; but Edison's improvement on it left the original inventor altogether in the shade. The Edison Company employed it to regulate the price of Edison's stock on the one hand, and gas stocks on the other. By this remarkable and useful little instrument the price of Edison's stock was advanced to \$4,000 a share, and gas stocks depressed to the extent of over \$60,000,000. These figures show how weak and impotent an invention may be even in the hands of its inventor; but when a man of genius gets hold of it, he makes it tell at once—on the stock board, at any rate."

#### Telegraph Colleges, So Called.

A correspondent of the *New York Star*, signing himself "Victim No. 2," in a communication recently published in that paper, says: "The institutions known as 'Telegraph Colleges' are nothing more than concerns for robbing poor people of their few dollars, by the men who have the school under their charge. I have attended one of these 'Telegraph Schools' for the past six months, and after all this time I am refused a position as an operator, or even assistant operator, not because I was unfortunate enough to be a graduate of a 'Telegraph School,' but because I was unable to take a position which was offered me. This is all due to the manager of the school, as he promised me faithfully, when I entered his institute and paid my money, that he would finish me at the end of that time, and assured me that I would be capable of taking a position; but I have only suffered and spent my precious time and money, as many hundred other young men and women of this city have, and have not received anything in return. I am sure that I did my part in turning my mind to the study and practice of telegraphy, but I am positive that the man to whom I paid my \$40 (which was the amount charged for one quarter) did not perform his part. \* \* \* Before paying my money I received a circular giving a full list of former pupils and their names signed to letters recommending the school, but I have hunted most of these up and could not find one among the many whose names appeared in the circular that would speak a good word concerning these schools. Just the reverse. I found they were all against them, and stated they were the worst kind of frauds, which is perfectly true. The managers have published their names without authority. You cannot find among the many hundred operators in this city one who will say they attended any of the telegraph schools. There might be several, I dare say, who have previously attended, but are not willing to own

up to it on account of the bad name the schools have received from the directors of the Western Union and other telegraph companies."

#### Transmitting Speech by the Telegraph Key and Sounder.

I see in your last *Scientific American*, in an article by George M. Hopkins, engravings of a method of transmitting articulate speech by an ordinary key and sounder, but it gives no information as to how it is done except by saying it is only a matter of adjustment. Will you please tell me through the columns of your paper how this is done?

H. F. DODGE.

CLINTON, Mo., Aug. 3, 1881.

[The sounder is mounted on a thin board, and the sounder lever is rigidly secured by the adjusting screws so that the armature is very near the poles of the magnet.

The key is placed on a thin board or on a resonant box, and the screw which passes the key lever and bears upon the spring is loosened until the platinum points are in light contact. By placing the ear in contact with the board upon which the sounder is mounted, and listening while adjusting the key, the proper contact may be readily secured.

Another method of adjusting the key is to turn the back adjusting screw until the contact points of the key touch, allowing the upward pressure of the spring on the key to remain normal. The required delicacy of contact may then be secured by screwing down on the spring so as to increase its upward pressure on the key. The key is mounted as in the other case.

This experiment requires a current whose strength is eight or ten volts.

By listening to the sounder whatever is said in the vicinity of the key may be heard.—*Scientific American*.

#### Indianapolis (Ind.) Notes.

To the Editor of The Operator:

SIR: Since our last correspondence from here several things of interest to the craft at large have occurred, including the organization of as healthy a union as has been yet reported from any of the other cities. The boys in this city, and, in fact, throughout this "whole neck of woods," hailed with much enthusiasm the attempt of our men to band themselves together in one common union, and be as brother should be to brother, acting in union with a view of bettering their condition. At our meeting, Aug. 7, held in parlor A of the Bates House, the following officers were chosen for the year: Mr. S. L. Douglass, W. U. office, Chief Operator; Mr. E. D. Carlyle, W. U. office, Assistant Chief Operator; Mr. Frank Farrell, Pan Handle, Secretary; Mr. F. M. Ketcham, W. U., office, Treasurer, and an Executive Committee, composed of Messrs. Kinney, MacIntire and Nixon. The Constitution of the Brotherhood of Locomotive Engineers was adopted upon the recommendation of the committee appointed at the preliminary meeting, the Sunday before, with one amendment, prohibiting members teaching our profession. We expect seventy-five members after our next meeting, and the boys along the lines of the many railroads centering here are inquiring as to our condition, and all favor the union. No doubt we will get two-thirds of the railroad operators in Central Indiana in a short time.

The following changes have taken place since our last: Mr. E. L. McClure, of the Bee Line, has resigned and gone to his home in Wabash, Ind.; Mr. Butterfield, of the Western Union, has resigned to "go to Chicago." Con Sullivan has returned from Chicago after a two week's stay. Con says he got sick; so did Geo. Samuels and Ed Ball, who went with him, and all have returned with the verdict that Chicago is "no good." We are expecting Al Vanlandingham every moment. Mr. Jno. Crowe has also returned from Louisville, where he went last summer. John stepped in the office unexpectedly last week, humming "Home, Sweet Home," and business stopped till everybody shook hands; John is an old soldier in this office.

We are happy to hear talk of increased wages among the railroad boys here. We claim some of the finest railroad operators in the country, and they think their salaries will soon compare with commercial men.

DUG.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher

NEW YORK, SEPTEMBER 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE IMPENDING SHADOW.

The electric telegraph has now become so widespread and indispensable to the public at large, that nothing should be overlooked by its managers which will tend to make it more effective and reliable, or to forestall by remedial measures any possible stoppage among the wheels of its machinery, either through the stupid mistakes of local managers or the downright folly of mistaken operators. When widespread discontent is plainly shown to prevail among the men—and such complaints as have seemed to us well founded have already, to a certain extent, been reflected in these columns—it is time for superior officers who have the interest of their company at heart to wake up and investigate the matter, and, if the grievances alleged prove to be well founded, to rectify them.

When the skin-flint Vanderbilt interest in the Western Union was so completely extinguished, last January; when subsequently the deliciously fresh and blithesome spirit of the Talented Young Vice President—whom we all remember as the De Sauty of the old concern—was instantaneously snuffed out; when a number of short-sighted, parsimonious officials were cast adrift to endure the hard trials which they had themselves so often imposed upon others; when the allegorical bushel of barnacles had been scraped off the old hulk, and when above all was recognized the master hand of General Thomas T. Eckert, there was a show of unbounded loyalty for the grand old concern which has rarely been equaled, in which this journal joined no less heartily; and for a time—remembering the brilliant management of the late American Union—a burst of sunshine seemed to bathe the whole profession with radiance and joy.

But the great disappointment came when the Sub Leaders—there are many of them throughout the country—took hold. A shadow then crept over the merry, toiling crew; the enthusiasm became dampened and hesitating, and the old story was soon repeated—the astute General mapping out a brilliant campaign, and the plans of his gifted brain palsied and misdirected by be-spangled and loud-mouthed martinets.

Your Sub Leader type of a telegrapher is one of the smart men of the business—that is, he advertises himself as such. He is a good man to hurrah and shout and carry the banner while some one else directs him, but when left to himself he is scarcely heavy enough for the undertaking. There is a good deal of talk and pantomime in such men, but there is little that is substantial. They are notoriously false and glittering. They

are alert, after a fashion, but blunder into all kinds of official holes. They are strict disciplinarians, apparently, but there is no intelligent or discriminating philanthropy in them. They are courteous and kind of heart, seemingly, but the sneaking look in the little eye betrays the dissimulating smile upon the lip. All of this class of men, soon after the consolidation, foolishly allowed the immediate but temporary advantage and personal prestige to be gained by hiring a “cheap man” to blind them to the intrinsic value of a good but rather more expensive one. Some of them went boldly at the question and reduced, or attempted to reduce, salaries wholesale. Others seem to have been seized with the belief—or at least, the willingness to believe—that while it might be a trifle unjust, or unwise, to appropriate a workman’s money, it was quite right to appropriate his time, of which money is only the representative. In some cases the larger offices, with regard to some departments of the service, were completely “cleaned out,” old men with records as high as 31 years, and whose names appear in Mr. Reid’s “Telegraph in America” as the earliest of Prof. Morse’s operators, being made to walk the plank in 1881, to make room for less competent but “cheaper” labor, thus indorsing the old Vanderbilt principle that if a man works for you you had better screw him down until life is barely left, and when by this process his peculiar dexterity is prematurely lost kick him out with a good conscience, to take some one else in his place on the same hard terms.

But the time has now arrived when some general investigation is necessary. The better class of operators desire no erratic spurts of philanthropy such as the recent paying of “double-extra.” There should be no mock heroics. You cannot stem the surging current of a mighty river by damming it up; you must look for and operate upon its many small sources. These lie in the original grounds of complaint, foremost among which are:

1. Inadequacy of pay before the consolidation.
2. Partial reduction of the same since the consolidation.
3. An attempt to abolish pay for “extra” service.
4. Increase of hours of labor, by adding half an hour’s, or an hour’s, work to each day.
5. The encouragement given to the student’s colleges by willingness to hire inefficient labor, on the sole score of cheapness.

The latter grievance, however, we can very well handle in our own way. Another, but less frequent, source of complaint is where the company makes a little “shave” off a sick man’s salary. A sick operator should, at least, receive the difference between his own salary and that paid to his temporary substitute.

As a matter of self-preservation the executive officers of the company should look into these affairs. By the hiring of a cheap and inferior kind of labor, messages are delayed or mutilated, and thereby, almost daily, trains are wrecked, husbands sent astray from their wives, fathers from their children, men and women die neglected, sales are lost, notes go to protest, and business men, pressed for time, are sent on all sorts of wild-goose chases. Good work depends primarily upon good pay, and all attempts to secure the former without the latter, no matter how tempting the prospect of big dividends may be, are certain to bring eventual failure upon the whole concern. Telegraphic work is not, like most manual labor, such as can be done in a humdrum and perfunctory way. It requires nice dis-

crimination, solid common sense and neatness of touch, and is a constant strain upon the mind of the worker. This kind of work can only be obtained by employing men whose long years of service have taught them to do, without telling, that which is exactly right in certain peculiar and extraordinary situations, and who, by long association with each other and familiarity with the business, know how best to serve the company’s interests.

Summary dismissals of faithful old men who have seen from a quarter of a century to thirty-one years’ active service in one situation; uncalled for reductions of salary, and the arbitrary increasing of hours of labor, already too long, are not the methods by which wise men, not blinded by mad dreams of economy, would seek to serve best the interest of the stockholders.

In our last issue we announced, upon the authority of the Cincinnati *Enquirer*, that Col. Clowry was about to be superseded by Mr. Chas. A. Tinker. In making the announcement we felt constrained to say that although Mr. Tinker was well-known as a reliable officer he was “not more so than Col. Clowry himself;” and, having thus recorded our opinion of Col. Clowry, it will scarcely be necessary to say now that we rejoice to hear that the report was an erroneous one. We have, therefore, great pleasure in reprinting the following denial of the rumor, clipped from the editorial columns of the same journal which made the erroneous statement—the usually accurate Cincinnati *Enquirer*:

“The *Enquirer* is glad to correct the report which has been extensively circulated of late, and which at first appeared to have responsible basis, to the effect that Colonel R. C. Clowry, General Superintendent of the Western Union Telegraph Company at Chicago, was to be succeeded by Mr. Charles A. Tinker, of the Baltimore & Ohio line. We make the correction on the authority of the managers of the Western Union Company at New York. Patrons of the company, more particularly those in the West, will be gratified to learn that Colonel Clowry is to be retained. He has many qualities which fit him for the important position of General Superintendent of the Central Division, and has won the esteem of all with whom he has business or social relations. By none are his abilities held in higher regard than by the Western Union Company, whose interests he has served so long and faithfully.”

We might also take this opportunity of paying a passing tribute to the industry and fidelity of this pioneer telegrapher, and of hoping that he may remain many more years in his present high position. We believe that another great telegraphic contest for supremacy is not far distant, and since Col. Clowry has always been known to be there when the battle commenced, and never to have left until the victory was gained, his company may soon find that he is preëminently the right man in the right place.

YOUR professional salary scalper has two grand objects in life. First, to trim sail so as to keep well up before the official wind; and, secondly, to make a “good showing financially” at headquarters. Since the consolidation, reasoning that an undisputed monopoly gave him the trump card, your professional salary scalper set out, smiling blandly, to execute both feats at once. It is not our fault if he has bitten off more than he can masticate. First of all, although he went around with a brass band and beat the gong, and although it was certainly a capital idea—for the company—the boys, somehow, didn’t “catch on” very enthusiastically. In fact, to be plain, the salary scalper’s efforts at economy failed miserably, owing to circum-

stances not wholly disconnected with the advent of the Mutual Union, Postal and other companies—not to mention the “Brotherhood of Telegraphers.” As for keeping well up before the official wind, your professional salary scalper aforesaid had a still more terrible time, since the official wind—fickle, as any other wind—has, during the past two months, been blowing all the way from due north to nor’nor’west, and back again to due north, thus taking up all the salary scalper’s vast amount of spare time in trimming official sail and “boxing” the telegraphic compass. Nay, after all is said and done, can it be possible that the ridiculous failure of these wonderful economists is due to—that is, is it possible that Gen. Eckert has been reading THE OPERATOR’S sound advice, given in our issue of August 1st, and that he has ruthlessly “sat down—hard—upon the devastating policy of those sub-officials who have no higher object than to ‘make a good showing’ financially?”

WHILE we have every respect for the rules of fair play, which guarantee to every man free trade, there can be little wonder if we discourage the wholesale manufacture of new members of a profession which cannot afford remunerative employment for those who are already engaged in it. While salaries are only kept at their present standard by extraneous methods, which, being understood in the proper quarter, it is scarcely necessary to explain here, it is wrong for these swindling concerns called “Colleges” to issue lying circulars, calculated to entice young men and girls from the country into studying telegraphy, and thus leading them innocently into a life which ultimately can only be one of miserable unprofitableness or downright idleness. In addressing practical operators there can be no use in dilating upon this subject; they can best deal with the subject themselves. Those who contemplate learning the business—which, according to the circulars of these “colleges,” is an exceedingly pleasant and desirable one, and may be mastered by any average boy or girl in a few months, when they can at once step into good situations at fabulous salaries—would do well to stop and consider why it is, if all these things be true, that operators should be so scarce as the same circulars show—in fact, why those who have learned and secured the alleged excellent situations at big salaries, do not remain in the business.

It is well known that up to the present time the success of working long wires and cables, quadruplex and duplex, is entirely due to the application of condensers to counteract the detrimental effects of the static charge and discharge of the line. This was an invention of Mr. J. B. Stearns, and, as his patent therefor in this country is the property of the Western Union Telegraph Co., other companies have been unable to create “phantom” wires, which are a source of immense profit to the Western Union. We are credibly informed that a new device, and one even more perfect than condensers, has been devised by a well-known electrician of this city, and that patents therefor are soon to be issued. The same gentleman invented a very simple system of sextuplex which was put up by the Western Union last year between New York and Philadelphia, and six Morse communications actually accomplished simultaneously. We understand he is securing patents also on two new systems of quadruplex, entirely independent of the Edison-Smith-Jones system now in use besides

two new duplex systems, all of which have proved successful on actual wires, and one of which does not even infringe the Page patent, and has done actual work on 500 miles of wire. It is a matter of congratulation to know that all our eggs have not been confined to one basket.

In illustration of the jaunty air of one of the President’s physician’s, who appears to be the *Mark Tapley* of the sad event, some of our esteemed contemporaries are referring to an old cable operator, De Sauty, who will be remembered by old-time telegraphers. De Sauty was the operator at the Irish end of the 1858 cable, the first of its kind; but, although the cable worked only for a few weeks, he obtained more fame out of it than its projectors did. The public on this side were being continually informed that the cable was working splendidly, and every message ended with the same phrase, “All right, De Sauty.” It is unnecessary to say that De Sauty became the laughing-stock of the whole country, and that when the cable finally collapsed De Sauty’s name sank into obscurity. His telegraphic fame still lives, however, and the curious may find it immortalized in some humorous verses in “The Autocrat of the Breakfast Table,” by Oliver Wendell Holmes. It might be interesting for our brethren at the forthcoming Old-timers’ reunion to take up the question, “What has become of De Sauty?”

THE International Congress of Electricians, “to codify, so to speak, electrical science, and to sound its depths,” will convene at the Palace of the Trocadero, Paris, this day two weeks. It is strange news to easy-going telegraph people to learn that M. Cochery has decreed that the meetings shall be secret, and that no prying member of the fourth estate of the realm shall be admitted. While we realize the fact that a Congress of Electricians which seems afraid of being raided by the police—or the newspapers—may still be a very harmless affair, since it is not known that Leo Hartman or O’Dynamite Rossa has been invited, yet we are at a loss to define their object in preserving a mysterious secrecy. There can be nothing desperate in “codifying, so to speak, electrical science and sounding its depths”—whatever that is—and we telegraphers want to hear what is going on, even if the Frenchmen won’t let us boss the job.

THE National Telephone Exchange Association, formed at Niagara Falls only one year ago, has in that short time grown to such dimensions that its forthcoming convention at Saratoga, next Tuesday, is looked forward to with intense interest. The rapid growth in seven months shown at their last gathering at Chicago April 5 and 6, was a matter of marvel to even its most sanguine supporters, and we are sure that the reports for the ensuing five months will not be less cheering. The exhibits made by the several manufacturers at these conventions are of great interest and value to those interested in telephones, and we expect to see a large gathering at Saratoga next Tuesday. We hope that, among other subjects, the feasibility of subterranean wires for telephones, and the prospects of adapting the telephone to long-distance ocean cable circuits will be fully and intelligently discussed.

THE fire in the reading room of the Electrical Exhibition, at Paris, attributed to a defect in the fitting up of some incandescent lamps, reveals a new source of possible danger from the electric light. It is little more than a year since the

British Museum, with its store of unique manuscripts and other priceless examples of literary production, was threatened with destruction through the same agency. Upon two different occasions a red-hot morsel of carbon dropped from one of the lamps, setting fire to papers, but the fire was each time promptly extinguished. We have little sympathy with the meddlesome countrymen who lose their lives every once in a while by fooling with the “brushes,” but if our electric light people expect to make a success of the thing they will have to provide means for avoiding disastrous fires through the use of their lamps.

BY the resignation of Mr. W. B. Somerville, the Western Union Company loses an efficient officer, while its patrons connected with the press find in the change many reasons for regret. For many years a journalist, Mr. Somerville was excellently qualified for his position as Superintendent of Press Transmission. He was equal to any emergency consequent upon a rush of press matter, and was always ready for any turn it might take, while his kind impulses and gentlemanly treatment of those who had dealings with the press department of the company will be kindly remembered by all. Now that he has once more resumed his literary spurs, which he won long ago, we welcome him back cordially to the field of journalism, where he may soon again prove his knighthood.

DISAPPOINTMENTS in regard to the biographies of subjects intended for Our National Portrait Gallery do not, it seems, come singly. Of the candidate for the present number, as in the case of that intended for last month, we have found it utterly impossible, after no end of writing and telegraphing, to secure sufficient data upon which to construct anything like a proper biographical sketch. Everybody who can give the information is “out of town.” We shall certainly be able to secure the points before next issue, and the reader would doubtless prefer the delay, annoying as it is, to the very incomplete sketch we could now offer them.

FROM the reports of what the opposition telegraph companies are doing, published in another column, it would appear that the consolidated company is not to be allowed to retain a monopoly of the business so long as some feared it would. Although the Mutual Union has all along kept very quiet, and its officers would give little or no information for publication, we have it from reliable authority that the company already has 10,000 miles of pole lines erected, and that when the Mutual Union opens for business it will cover so large a territory as to be thoroughly prepared for any reduction of rates tactics on the part of the Western Union.

IN consequence of the consolidation of the Canadian lines, operators there may now look for a little of the unpleasant experience through which we have just passed. Duplicate offices in the same town will be closed, and the dual force otherwise reduced, but we hope that the difficult duty will be more tenderly dealt with than it was in the rough-and-tumble American Union-Western Union transfer. The companies themselves may also experience some of our legal troubles, and we should not be surprised to hear of the case speedily in the Court of Queen’s Bench, which, we believe, sits this month.

AMONG all the wild claims made by Mr. Edison and his people with regard to electric lighting, nothing seems so absurd as their claim that Edi-

son's patent gives him "the exclusive control of incandescent electric lighting, both in this country and in Europe." Incandescent lighting covers a great many different methods, and while Mr. Edison may claim all that is due to him, he cannot set himself up as a monopoly in the business, to the exclusion of equally meritorious inventors. This will be held to be good law in the courts of France and every other civilized country.

A LONDON journal, the *Saturday Review*, in characteristically claiming for England all that is creditable in electrical science, mentions incidentally Cooke, Wheatstone, A. Graham Bell and other leading electricians as natural born subjects of her most gracious majesty, but still leaves us Edison, though matching his genius with that of an Englishman, Mr. Swan. This is the unkindest cut of all, since Edison, too, first saw the light under the English flag. We are, however, grateful that the *Saturday Review* has not laid claim to Franklin, Morse and Henry.

THERE are two things to which the "electro-technicians" about to assemble in congress in Paris might devote their attention: The safety of ocean cables in time of war, and protection of telegraph offices from unreasonable search by minions of the law. The first of these subjects might well be made a matter of international treaty, and the second might be covered by an official resolution on the subject. The delegates could then be instructed to make proper representations to their respective governments.

JUDGING by our correspondence, that "one man at Charleston," who, according to the plighted troth of a prominent official, had his salary reduced, takes the shine out of Falstaff's seven men in buckram for numerical strength. We have heard from him from the North, South, East and West, and everywhere he is plaintively crying, "Me too." He is about the most numerous "one man" we ever corresponded with.

IT seems worthy of note that an ocean steamship, some hundreds of miles out at sea, should be able to telegraph home that no needless alarm should be caused if certain casks and boat-gear were found adrift, since they had just been washed overboard. Yet this was the thoughtful action of the captain of the *Faraday*, the ship paying out our new cable.

To those officials who are contemplating the introduction into our system of stamps for paid telegrams, to be used as postage stamps are now used for letters, it may be interesting to know that Mr. Fawcett, the English Postmaster General, writing to a Welsh correspondent, remarks that the question of abolishing such stamps is now under consideration.

INVENTORS of underground systems of wires are multiplying fast, now that it seems certain that the aerial lines must go. As soon as it is plainly shown that we *have* to do it, it will be a cold day when your American genius cannot discover something that will obviate every difficulty now found in the present subterranean system.

THE luckless man who invented that electric lamp which, upon being placed in the Electrical Exhibition, promptly set fire to the establishment, will doubtless get left when the committee on awards come to deal out the medals.

WITH regard to the backwardness of the Electrical Exhibition, a witty French paper, just to hand, says the chief thing lacking there at present is—electricity.

## Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible:  
Theoretical as far as necessary.

Q. 148. Have any steps been taken toward the general introduction of an improved wire gauge? If so, with what result?

A. It has been universally admitted that the necessity for a new and standard wire gauge is urgent, on account of the uncertainty and unreliability of the various gauges now in use. The Birmingham gauge has been nominally the standard by which wire has generally been sold, but it has been ascertained that this gauge varies with nearly every manufacturer, so that if wire is ordered of a certain gauge, there is no security that the wire received will be of the same size as the wire required. Moreover, the several sizes bear no regular relation to each other. For these reasons the necessity for a standard has of late been generally acknowledged. Preece & Sivewright, in their text-book on telegraphy, recommend a gauge based upon weight, giving many good reasons why such a standard should be introduced. This gauge was proposed by Messrs. Mallock & Preece.

It is, however, obvious that it is only adapted to one material, since, for example, a wire of copper a mile long, with a diameter of 120 mils., would weigh about 230 pounds, while an iron wire of the same diameter would weigh 200 pounds. In view of the increasing necessity for a standard, in 1879 a committee of the Society of Telegraph Engineers was appointed to consider the various wire gauges in use and proposed, and to report the most proper, if any, for general adoption. In the course of the committee's investigations, it was found that no less than fourteen gauges were in more or less general use, nine of which have the differences in the respective sizes formed arbitrarily or by no regular gradation. The other five are graded upon the principle of geometrical progression, and hence are called geometrical gauges.

The committee, after a careful consideration of each of the fourteen gauges, recommended the gauge of Mr. Latimer Clark for adoption as a standard.

This is a geometrical gauge, in which the gradations are so arranged that each size is 20 per cent. less in weight and electric conductivity than the one immediately preceding it. It varies considerably in many of the sizes from the old Birmingham gauge, but is nearer to it than any other of the geometrical gauges.

Notwithstanding the recommendation of this committee and the necessity of a standard, it does not yet appear that the manufacturers have taken the matter up practically, and the Birmingham wire gauge in all its delightful uncertainty is still, in this country at all events, considered as the wire gauge.

Q. 149. Should a large or small size gauge of wire be preferred for long lines?

A. The longer a line the larger should be the gauge of wire used, as illustrated by the fact that on the short private lines so well known in our cities Nos. 11, 12 and 14 are generally used. On telegraphs of ordinary length between cities; Nos. 8 and 9 are commonly employed, and for the longest telegraph lines—such as those between New York and Chicago, and New York and St. Louis—Nos. 6 and 4 either are, or should be, invariably used. The largest size used in England is No. 4, which is nearly a quarter of an inch in diameter.

Q. 150. What are the reasons for using large wires for long lines?

A. In the first place, the smaller the wire the more care is needed in insulation; the smaller a line wire is the less is its conducting power and, necessarily, the greater is its resistance. In a line the current from a battery has a choice of routes, so to speak, either to traverse the line wire, thereby arriving at the distant point, or to leak to ground over each insulator and down each pole. A certain amount of leakage does take place at every pole and, therefore, the current does actually divide between the two routes in direct proportion to their respective conductivities. Although the amount of electricity which leaks off at one pole is inconsiderable,

when we remember that there is an average of thirty poles to the mile, and possibly a great number of miles to the line, we see that the total amount of leakage is by no means inconsiderable. We must further consider that the resistance of a line wire increases in direct proportion to its length; that is, if a wire 100 miles long has a resistance of 1,000 ohms, when extended to 200 miles long the resistance will be 2,000 ohms—provided the wire is kept the same size. The sum of the whole being that every line, as it is made longer, decreases the resistance of its insulation by adding many more poles, at each of which there will be some leakage, while it also has the resistance of its proper conductor increased, because each mile of wire adds a mile of resistance. It is obvious, then, that to maintain the conductivity of the line at its proper standard, we must increase its size and thereby keep its resistance down. We shall, by so doing economize battery power, because reducing the line resistance practically shortens the circuit. By using smaller batteries we gain incidentally another advantage; namely, the decreased tension of the current and consequently its decreased ability to escape, or the greater ease with which it may be insulated. Another point in favor of large wires is that they are much more durable in proportion than small ones.

## Answers to Correspondents.

Is it a common occurrence for a Blake transmitter to act as a receiver? I have one that I am enabled to carry on conversation with without any telephone in circuit. Can you give the reason of its working that way? I hope to see the explanation in your next OPERATOR.

LEWISTON, Me.

A. G. K.

It is by no means uncommon for a Blake transmitter to possess the properties of a receiver.

This property was first discovered by Berliner, and is common to all microphones. The principle is embodied in a patent issued to him entitled a contact receiver. It is explained as follows:

If two electrodes be placed in contact to form part of a circuit, and a current of electricity be passed through them, a repulsion is exerted between them.

This force of repulsion may be weakened or strengthened by varying the strength of the current. As that strength is varied by any appropriate form of battery transmitter or speaking telephone, so will also the force of repulsion at the point in the transmitter which is being used as a receiver be alternately weakened and strengthened accordingly, and will therefore cause its plate to vibrate at the same rate and measure.

The latter vibrations being communicated to the surrounding air, the same kind of sound as uttered against the original transmitter will be reproduced at the second transmitter.

"G.L."—The Telegraphers' Mutual Union, of New York, like the Brotherhood of Telegraphers, of Chicago and other cities, and similar organizations throughout the country, is a society of telegraphers for mutual support, benefit and improvement, and incidentally of mutual protection. It is not a secret organization. When a member is out of work, the society endeavors to secure a position for him, and when he is sick he can draw a stated amount per week from the treasury, the other members in the mean time, as far as possible, in turn performing his regular telegraphic duties until his recovery.

G. C., TEXARKANA, ARK.—An ohm is the unit of electrical measurement, just as an inch is a unit in measuring distances. It is so called because first used by the electrician Ohm. An ohm is the unit of resistance to the passage of an electric current, and is about equal to the resistance of 330 feet of No. 9 iron wire of average quality.

### The Pioneer Telegraphers' Reunion.

To the Editor of The Operator :

SIR: Not half enough has been written in favor of the Old-timers' meeting, to be held at Niagara Falls, Sept. 20. Those who attended the reunion at Cincinnati last year need no urging to be on hand this time. All so thoroughly enjoyed it then that not one of them will miss the coming gathering if he can help it. But the attendance at Cincinnati, although large, was not half so large as it should have been. The telephone convention, held at that time at Niagara Falls, prevented many veterans from going to Cincinnati; the excessive heat usually experienced in the latter place in September deterred many others from going, and still a larger number who did not go would have gone if they had known what a splendid time awaited them. Now that a permanent organization has been made, and the finest place in America chosen for the next meeting, it seems as though there certainly must be a large attendance and a glorious time.

Grand old Niagara! It is probable that there are but few old-timers who have never visited that magnificent locality, but who among them all has not with each succeeding visit been more and more impressed with the beauty, grandeur and awe-inspiring scenes there so lavishly spread out by nature?

But this is only a small part of the enjoyment in store for those who attend the meeting. The greeting of old friends who may never be met elsewhere on earth; the brightening up and rehearsing of early reminiscences of matters connected with telegraphy and old associates in the business; the splendid drives; the banquet, which will undoubtedly be one of the best ever set before a hungry telegrapher. All these and many other excellent features embraced in the programme will make this an occasion that no one can afford to miss.

Let me add, right here, that John C. Lark will be there. Genial, jolly, jovial John C. Lark! Who does not know or has not heard of the "Great American Traveler?" Those who attended the Cincinnati meeting—especially those who took passage in the Highland Chief—will never forget the flood of rich stories and conundrums he favored them with, in his inimitable style, from the inexhaustible supply he has picked up in his extensive journeyings. John says he will be on hand sure.

All persons in good standing who were engaged in the telegraph business in any capacity previous to 1863 are eligible to membership, and may be received upon the payment of an initiation fee of five dollars. Those intending to join the association should write to Mr. J. C. Mattoon, Secretary "Old-Time Telegraphers' Association," care W. U. Tel. Co., Cincinnati, Ohio, at once, inclosing the five dollars. This sum will probably cover nearly, if not quite, all the expenses at Niagara Falls. SUBURB.

### "The Old Time Telegraphers' Association."

To the Editor of The Operator :

SIR: The time for the first meeting of the "Old Time Telegraphers' Association," organized at Cincinnati Sept. 7, 1880, is close at hand. The great increase and importance of telegraph business for some time past has prevented my answering much individual correspondence. A lack of time prevents a merited attention to a subject dear to veteran telegraphers. A fair enthusiasm and co-operation is urged from all interested. An inability to send circulars to those who might not easily have access to telegraph papers must be equalized by the individual efforts of each "old-timer" to make the notice of the next meeting at Niagara Falls, Wednesday, Sept. 21, 1881, as widespread as possible. I, inadvertently, announced the third Tuesday in September in the previous card. Please remember, it is Wednesday, Sept. 21. As to membership, the general understanding is that all who donated toward the "old-timers' reunion" are members, subject to whatever the per capita expense of the next meeting may be, which should not exceed five dollars, all others being subject to the initiation fee of \$5 for membership. This initiation fee from new members may be all that will be required, at least until the meeting, when definite action will be taken for the future guid-

ance of the Association. It has not been deemed advisable to attempt to arrange for reduced railroad transportation, but that each one will endeavor to make the best possible arrangements for himself, and that the various telegraph superintendents will be as consistently generous in this respect as possible. The Committee of Arrangements report their programme as quite complete—hotel rates reduced to \$2.50 per day, and to the various points of interest one-half the regular charges. It is hoped that each one will exert himself to swell the attendance. I would again urge that all who propose to attend send me their names. Remittances to J. C. Mattoon, W. U. telegraph, Cincinnati, Ohio. Final notice will be given in the next issue of the telegraph papers. J. C. MATTOON,

Sec'y "The Old Time Telegr's Ass'n."  
CINCINNATI, O., Aug. 27, 1881.

### Chicago Notes.

To The Editor of The Operator :

SIR: Please note following changes and personals:

Appointments: Assistant Chief Thayer to Eastern Division (New York wires), days.

D. L. Wilson succeeds Mr. Thayer as Asst. Chief on Detroit, Cleveland & Toledo wires.

Referring to personal notices of appointments last issue, your correspondent would make a correction, having been wrongly informed regarding an appointment that was rumored as about to take place. Assistant Chief Operator Mr. W. J. Lloyd was promoted from the Western Division (overland wires) to the Eastern (N. Y. wires) nights, succeeding Mr. W. R. Holligan, who was appointed a chief of full rank, vice Mr. W. A. Leary, resigned.

There are those in our profession to whose credit from time to time the favors of promotion are bestowed, and who do not lose in a disagreeable way by such promotions their identity as agreeable gentlemen of good sense and understanding. Your correspondent finds pleasure in declaring that he feels perfectly safe from denials in asserting that all who know the subjects of the last-named promotions, particularly those who have been in any measure affected thereby, will cheerfully accord the high meed of praise above mentioned, and further, that they have fairly won exalted reputations for strict probity of conduct, and as possessors of unusual talents and abilities. Modest, gentle and genial to an admirable degree, they move in their manifold duties with a quiet dignity and an earnest precision that wins the laudations of us all, and appears to assure for them an equality for any promotions to which they may be in the future called. Both young in years, yet their records would form an interesting and instructive biographical sketch. However, we beg their pardons, and spare them until we can add the notes of coming days and coming successes.

Resigned: Sam Wallace, *Inter-Ocean* private line, gone to Washington, D. C. J. McRobie (Asst. Chief N. Y. wires), gone to accept a chiefship in Peoria, Ill., where he hopes to regain declining health. Mac takes with him the unbounded esteem and best wishes of us all. Dave Stormont gone home to Cincinnati. O. M. Stone resigned to go into other and more profitable business.

Arrivals: Mr. Hutchinson, of N. Y.; James Adams, of Ottawa, Ont.; Mr. Wilson, of Clinton, Ia., and several others whose names are not at hand.

On Vacations: Asst. Chief Patten, Mrs. Prescott, Asst. Chief Thompson, and Mr. N. T. Callett.

Visitors: Supt. McMichael, from Minneapolis; Manager Wordsworth, from Cleveland; Hector Scott, Board of Trade, Milwaukee, and Levi Wild, from Ogden, Utah.

CHICAGO, Aug. 24, 1881.

### Baltimore Notes.

To the Editor of The Operator :

SIR: The telegraphers of Baltimore held a meeting Sunday, Aug. 14, for the purpose of forming themselves into an organization for the promotion, advancement and benefit of the members of the telegraphic profession. The association was called the Brotherhood of Telegraphers. At a meeting held Aug. 21 a constitution and by-laws were adopted. In case of illness a member is entitled to draw six dollars

per week from the association, provided he has been a member five months. The meeting was a thoroughly representative one, many old operators being present. Greetings are solicited from kindred associations in other cities.

The electric light is making wonderful progress here. Nearly all the large business places are using it with success. By the time of Baltimore's Oriolo festival, which takes place in October, it is thought that almost the entire city will be illuminated.

We regret to chronicle the serious illness of Mr. Jno. Hingerty, of the Union R. R., who is suffering from general debility.

The Mutual District Co., an opponent of the American District, has opened for business. It will be operated in connection with the Mutual Union Co. Mr. Geo. F. West is general manager. Mr. McCormick, of the Union R. R., has gone with the B. & O., also J. A. Glenn, of the P., W. & B. T. Llufrío has gone to Texas. Tom will be missed from the ranks. E. L. Bussard is convalescent and has gone with the A. U. T. J. Sullivan, of the Associated Press has resigned and gone to pastures new. Business lively at all offices; first-class men wanted badly.

BALTIMORE, Aug. 22, 1881. EXCELSIOR.

### TELEPHONE DEPARTMENT.

The Staten Island Telephone Co. is making good progress, and will soon be ready to open for business.

Several samples of anti-induction cables manufactured at the Bishop Gutta-Percha Works will be exhibited at the Saratoga Convention.

Ironton and Portsmouth, O., are now connected by telephone; distance 28 miles. Ironton and Proctorville are also connected; distance 24 miles.

The new cable of Mr. P. B. Delany, recently patented, by means of which telephone lines can be run underground without any inconvenience from induction, is highly spoken of by telephon men who have examined it.

Messrs. C. E. Jones & Bro., of Cincinnati, are getting ready to move into more extensive quarters, to accommodate their increasing business. They turn out a large amount of telephone apparatus, including the well-known Jones switch.

At the opening of the Electrical Exhibition, at Paris, the telephone was tried for Pr. ident Grévy with the Grand Opera, where the "Prayer" from "Masaniello," was sung by the full chorus, the experiment being perfectly successful.

An attractive new advertisement of Messrs. Davis & Watts will be found in this issue. This firm keeps well up with the rapid improvements in telephone apparatus, and can always be depended upon to furnish a high quality of instruments at a reasonable price.

Every one knows, says *Nature*, that the feeblest currents produce audible sounds in the telephone, which is more sensitive than any galvanometer to feeble currents. M. Pellat lately declared that the heat necessary to warm a kilogramme of water one degree would, if converted properly into the energy of electric currents, suffice to produce in a telephone an audible sound for 10,000 years continuously.

Judge Donohue, in Supreme Court, Chambers, has set aside the injunction granted, with the order to show cause, in the case of The People against the Metropolitan Telegraph and Telephone Company. The suit was originally brought by a number of property owners to prevent the defendants from erecting poles in front of their houses or hanging wires thereon. The grounds urged by the plaintiffs were that the Legislature, by its general acts, permitted the use of the streets for telegraphic poles and wires, but that the telephone people had no rights under that law, as the telegraph wire and the telephone wire were, in the eyes of the law, widely different things.

The telephone convention takes place, as already announced, at Congress Hall, Saratoga Springs, N. Y., on Tuesday, Sept. 6. Special rates of railroad fares have been secured. From New York and return by the N. Y. C. R. R. the fare will be \$5.50, tickets obtainable from Sept. 3 to 7, good to Sept. 15, at 413 Broadway and G. C. Depot. From Buffalo and return the rate is

\$9; Indianapolis, \$31.45; Cincinnati, \$27.80; St. Louis, \$30; Chicago, \$21.60. The terms at Congress Hall are to be \$3 a day for a single room occupied by one person; for a room occupied by two persons, \$2.50 a day each. It is believed that the convention will be largely attended. Many valuable reports will be presented.

The Law Telegraph Company will exhibit at Saratoga a new switch table which delegates to the convention should not fail to carefully examine. The principle chiefly involved in its construction, and one we think entirely new, is that which enables two, three or four operators, without leaving their seats, and each independently of the others, to work the same group of subscribers. The tables operated in probably three-quarters of the exchanges have forty to fifty subscribers each. As an illustration of the new table, imagine eight of these condensed into one table, 34 inches square, and the eight operators reduced to four, and seated one on each side of it. These four operators are entirely relieved from the work of sending to and receiving from seven tables orders for connections and disconnections, and are thereby enabled to wait on twice the usual number of subscribers. They can do this, too, with greater accuracy and more dispatch.

The Harrisburg (Pa.) *Telegraph* says it is a somewhat singular fact that an ordinary business man will put up with almost anything he makes use of except the telephone; but from the greatest invention of this or any other century—an instrument that daily saves him more time and labor than all his other improvements put together—he won't stand the slightest nonsense. He turns in a signal. If the answer does not come instantly he swears. He tells the central office the person he wishes to speak with. If the bell does not tap again before he can count a dozen he swears some more, and vows he could go and do the errand in half the time. The telephone, it adds, is the best thing of the age to bring out human nature. A man will show more of himself in five minutes before this delicate little machine than in half a year in ordinary ways. The *Telegraph* goes on to recommend that the bells be made with a little mirror, to enable some of those irascible people who think it strange that the telephone can't go out and harness up a horse for them, to see the latest and most improved specimen of a jackass.

## DASHES HERE AND THERE.

Western Union stock is quoted at 88½; last issue it was 89.

An attractive new page advertisement of the Utica Fire Alarm Telegraph Company will be found in the present issue.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.

Two naval officers were killed at the torpedo station, Newport, R. I., Aug. 29, through carelessness in handling the electrical apparatus used to explode torpedoes.

In a re-arranged advertisement in this issue, the Bishop Gutta-Percha Works give cuts of a number of different cables, manufactured by them, including those for both telegraph and telephone purposes.

The cable steamer Faraday, after shipping four hundred tons of coil of the new American cable, sailed from Plymouth, England, Aug. 26, to resume the laying of the cable.

The Government cable steamer Newfield returned to Halifax, N. S., on the 25th ult., after a six weeks' voyage. Six splices of cable have been made and one cable from Grand Manor to Campo Bello and one from Campo Bello to Eastport have been laid.

A fire, similar to the recent one in the W. U. main office in this city, was discovered in the Titusville, Pa., W. U. office, Aug. 24. The fire was found to be at three different places where the wires—insulated though they were—touched the joist and cross-braces. It was put out without much damage.

Last week, at Elizabeth, N. J., Joseph Nevins, aged 26 years, while fixing electric light wires in the Bowker Fertilizing Works, was caught in the shafting and whirled rapidly around.

He was almost eviscerated. One arm was torn from its socket and both legs were broken. He died in a few hours. He leaves a wife and child.

Since the introduction of dynamo-electric machines a good many valuable watches have been almost completely ruined by having their works magnetized. Mr. Maxim, the electrician, has, however, invented a machine, now at the Paris Exhibition, which in a few minutes completely de-magnetizes a watch, leaving it as free in its movements as ever.

The Evans 26-shot sporting rifle, advertised by E. G. Rideout & Co., 10 Barclay street, is a great bargain. We are positively assured that the retail price of these rifles was \$40 each; any one can get the same rifle now by sending to the above-named firm only \$15. They offer to refund the money sent if the rifle is not as represented. Read their large advertisement in this issue.

Messrs. Partrick & Carter's new page advertisement in another part of the present issue will well repay careful perusal. This firm is as enterprising as ever; still turns out the high quality of instruments and apparatus for which it has become so well known among telegraphers everywhere; is constantly adding new and valuable specialties to its stock, and continues to sell good goods at remarkably low prices.

A dispatch from Newport, R. I., says that Capt. T. O. Selfridge, in command of the torpedo station, conducted some interesting and successful experiments on board the United States tug Nina between Fort Adams and Beaver Tail, on the 25th ult., in which he demonstrated the advantages of the system of electric lighting for war purposes on board ship, and by which torpedo boats from shore or from an enemy's ship could easily be detected.

Mr. A. B. Lyman, of Cleveland, O., advertises his well-known O. K. instruments in another column. This O. K. outfit gives so universal satisfaction to purchasers that Mr. Lyman advertises to send it C. O. D., with privilege to examine before any money is paid. This shows the confidence he has in the goods, which, however, is evidently well-founded, as he states that he has never had an instrument or outfit sent in this manner returned to him. Mr. Lyman also has a cheaper outfit, the Sheridan No. 2, which he furnishes for \$4.25.

A report was recently cabled from Paris to the effect that Edison's agent had procured the seizure of the Maxim lamps at the electrical exhibition, on the ground of an alleged infringement of Edison's patents for incandescent electrical lighting. A later dispatch, however, states that the story of the seizing is wholly untrue. It adds that no injunction has been issued having the effect of restraining the sale of the Maxim light or its exhibition at the Paris Exhibition. A descriptive injunction has been issued at Paris against the Maxim, but its friends claim has no such effect or operation.

From the report of the British Postmaster-General, just issued, we learn that the telegraph business in Great Britain continues to constantly grow. The aggregate of messages last year was 29,966,965, which showed a gratifying increase of 3,429,828. Never until now has this department been made to pay. Last year's receipts from telegrams reached a total of more than \$1,640,000, which paid the year's interest in full on the original outlay, all the expenses of the service, and left on hand a small balance. While the excess last year of the number of letters posted was only 4 per cent. over the former year, the excess in messages was 12.

While Superintendent Robert Sheehy, of the Brush Electric Light Company, with a number of men, was preparing on Saturday last to test the four lamps on the one-hundred-and-fifty-foot pole in Union Square, destined to illuminate the park, the hoisting gear at the top of the pole broke just as the lamps had reached the top. The lamps and their "carriage"—a heavy mass of iron weighing more than six hundred pounds—fell with a terrible crash, from the height of more than a hundred feet, on to the platform, twenty-five feet from the ground, upon which five men were working the hoisting apparatus. Two of them were fatally injured, one having died since, and the other being at the point of death. Three were more or less seriously injured.

The new metal of which it is proposed to construct pipes in which to lay telegraph wires under ground is described as very light—only about one-sixth the weight of iron—and, being composed almost entirely of pure carbon, is indestructible, whether in the air or under ground; it does not rust or change by exposure, and is not affected by heat or frost. The most important characteristic claimed for it, however, in connection with underground wires, is its being a perfect insulator. The pipes of the metal need not, it is stated, be buried very deep in the ground, as they may be of a semi-elastic character, adjusting themselves to the slight upheaval and depression of the ground through the action of frost.

A petition has been presented in Boston asking permission to lay tubes through the streets for the purpose of running telegraph and telephone wires underground. The proposed company, if the desired right of way—which wants it to be an exclusive one—can be secured, will lay wires at its own expense in terra cotta, and will let then to all applicants, including telegraph and telephone companies, for a royalty which they say they are willing that the city shall fix if it chooses. All lines owned by the city they promise to take free. The telegraph and telephone companies vigorously oppose the granting of the right, on the ground that, in the first place, it is impracticable, and, in the next place, it is merely a scheme to get control of a valuable right and then use it to make money. The new company has many prominent and wealthy men connected with it, and it is thought the desired permission will be granted at the next hearing, which occurs early in September.

## NEW YORK CITY ITEMS.

The body of William A. Irving, a telegraph operator of this city, who was drowned in the Hackensack River on Thursday, was found on Saturday last and sent to Speer's Morgue, Jersey City.

The linemen of Edison's Electric Light Co. have formed a class to study the elementary principles of wiring buildings for the electric light. Mr. E. H. Johnson delivered the first lecture to them.

Mr. W. B. Somerville, who, for two years past, has managed the business relations of the Western Union Telegraph Company with the newspaper press of the country, has resigned his position to re-enter upon the work of journalism.

The hours of duty of the A. D. T. managers, in the majority of the offices, were reduced from twelve to ten hours a day on August 19. The change, which was a much needed one, has given great satisfaction, and was largely the result of the efforts of the General Superintendent, Mr. Wm. F. Chester.

The officers of the Edison Electric Light Company state that the rumor of negotiations between themselves and the United States Electric Lighting Company are absolutely without foundation, and they have no intention whatever of entering into any such negotiations with the United States Company.

The city having awarded to the Brush Electrical Illumination Company a contract to light certain portions of the city in the neighborhood of Madison square, the company immediately proceeded to erect the necessary poles, etc. While working in West Twenty-fifth street, however, they were stopped by an injunction obtained in the Superior Court, by property owners, who claimed that the poles erected were unsightly and lessened the value of their property. The motion to make the injunction permanent was heard by Judge Speir, who rendered a decision denying the motion and dissolving the temporary injunction.

The stockholders of the Mutual District Telegraph Company, at a special meeting, voted to increase the capital stock of the company from \$250,000 to \$300,000. The stock of the Mutual District Messenger Company was also increased \$1,250. The new stock was at once taken by the syndicate which holds all the old stock, and of which Butler, Stillman and Hubbard are trustees. It is said that the purpose of the company in issuing the new stock is to provide money for construction, as the company is rapidly extend-

ing its lines above Fiftieth street. The Mutual District Company is merely nominal, it having been organized simultaneously with the telegraph company to save all questions of the right of the latter to transact a messenger business under the State law.

## PERSONAL.

Mr. H. M. Scott, of the Milwaukee, Wis., W. U. office, was married last week to Miss Hattie F. Wolcott, at Holyoke, Mass.

Miss Carrie Edwards, of the Detroit, Mich., W. U. staff, paid THE OPERATOR office a visit last week. Mr. G. J. Carroll, of the same office, also called.

Mr. Frankenberg, formerly of the government military telegraph service in New Mexico, is now working as operator for the Western Union at Baltimore, Md.

Messrs. Tom Kehoe and C. A. Butterfield, of Mobile, Ala., have resigned to go to Milwaukee and Philadelphia respectively. They are both first-class operators.

Mr. V. M. Moore, for some years connected with the W. U. office, at Henderson and Owensboro, Ky., has accepted a position as operator at Springfield, Tenn.

Mr. E. R. Scott, of Amherstburg, Ont., having returned from his Eastern trip, Miss Fox, who was filling his place, will probably be transferred for a time to the Windsor office.

Professor M. G. Farmer, electrician at the Newport torpedo station, has resigned, to take effect on Sept. 1. Professor Farmer has been electrician at the station for many years.

Mr. H. E. Sheets, formerly agent and operator at Lockwood, is now in G. R. & I. city office, Grand Rapids, Mich. Mr. W. J. Quinlan, at Stanwood, has resigned, and is succeeded by Mr. C. H. Clark.

Mr. W. H. Michener, Manager Mutual Union office, Foxboro, Mass., while taking equestrian exercise a day or two since, was thrown by a vicious horse and sustained a very severe shock to his nervous system.

Mr. Dennis J. Hern has been appointed Superintendent of the Eastern division of the Mutual Union Company, with headquarters at Boston. Mr. Hern is a well-known telegrapher, and his friends will be pleased to hear of his deserved good fortune.

Wanted—To know whereabouts of Silas Williams; last heard of in Indian Territory, five years ago; supposed to be in Texas now. Any information thankfully received by his brother, A. J. Williams, Mgr. W. U. Tel. Co., Elliston, Grant Co., Ky.

Mr. J. B. Bennett, of San Luis Obispo, Cal., is one of the most popular citizens of the town in which he resides. He is a good electrician, in addition to being a good operator, and takes an interest in everything pertaining to the telegraph and telegraph operators.

Mr. Nat Stewart, finding that he was not becoming wealthy upon the salary received for running the Western Union office at Lompoc, Cal., upon "commission," is now successfully engaged in running a fine "ranch" of his own near that place, which, by the way, is the centre of a flourishing temperance community.

Miss Josie A. Norcross, of Santa Barbara, Cal., is one of the best female telegraphers upon the Pacific coast. In addition to hard work in the telegraph office, she acts as agent for the steamship company at that point, a position which of itself is no sinecure. She is said to perform her duties to her employers "like a little man."

Mr. Fred. Anderson—more generally known as "Dad"—has resigned the night chieftainship at St. Paul, Minn., and gone to Milwaukee. He is succeeded by W. L. Gregory, formerly assistant to Clark Davison, Day Chief. H. E. Thompson has left the key, for a time at least, and is now connected with the St. Paul Electric Works.

At Deming, New Mexico, Mr. Gore is the manager of the Western Union, assisted by Mr. J. H. F. Schall, an operator well known upon the frontier. In the office of the Southern Pacific Railroad, at the same place, Mr. Sheppard is manager, with two or three assistants. Mr. Hartwell, ex-train dispatcher at Sacramento, is also at Deming.

Mr. Coons, ex-Manager of the Western Union at Bakersfield, Cal., is doing well in the jewelry business in that town. He was one of the oldest employes of the Western Union upon the Pacific Coast, and filled temporarily the office of District Superintendent. The cheap labor policy of the company changed Bakersfield from a salaried to a commission office, and, as is frequently the case, the Western Union lost one of its best men.

Captain Henry W. Howgate, who will be well remembered as Acting Chief Signal Officer, at Washington, under the late Gen. Myer, was arrested at Mt. Clemens, Mich., on the 15th ult., charged by the Government with embezzlement. The alleged frauds are chiefly in connection with the telegraph bills of the Signal Service, and are said to aggregate \$400,000. Captain Howgate has been held in \$40,000 bail. His health is in a precarious condition.

N. C. AND ST. L. PERSONALS.—Chattanooga Division: Charley Heard is operator and freight clerk at Chattanooga, Tenn.; Sam E. Rowden, agent and operator, Wauhatchie, Tenn.; Jno. Morgan is at Whiteside, Tenn.; Sam Ingersoll, at Shellmound, Tenn.; E. W. McGaughey, at Bridgeport, Ala.; Si Willis, day operator, and Wm. Huddleston, night, at Stevenson, Ala.; Jesse Horn, agent and operator at Sherwood, Tenn.; Wm. Stewart, agent and day operator, and M. L. Williams, night, at Cowan, Tenn.

SALAMANCA, N. Y.—The American Rapid Telegraph Company proposes to compete for the \$300 per month business done here exclusively by the W. U. Among the operating fraternity who aspire to higher positions in the dismal future are Thos. W. Potter, Manager; Wm. Melhuish, Assistant Manager; J. S. Taggart, Geo. Rigdon, Geo. W. Leveridge, J. C. Kuhn and S. C. Keynon. The two latter are United Pipe Line men. Among those on the retired list are Wm. Mulcay and Chas. Frank. The latter has been running a student mill (where he was formerly employed, at the Pipe Line office), and had no less than five under instruction when he was nipped in the bud and cast out to the mercy of the winds and waves, to be tossed on the tempestuous sea of life to look for a job. Charlie is a good fellow, but the glitter of filthy lucre (probably \$25 per head) was too much for his avaricious disposition; he took them in, and thus the old, old story, they beat him.

CHATTANOOGA, Tenn.—Mr. J. B. Norris, manager of the American Union, was appointed manager of the consolidated company on the 1st of July, vice Mr. Norris R. Young, resigned. The latter has since been appointed night manager. The day force has somewhat changed, and several new faces are to be seen. They are arranged as follows: Billy Burton, day chief; A. M. Pennock, acting wire chief; Jack Riley, N. Y. duplex; Charles Skelton, New Orleans quad; Sam. Swartz, Montgomery quad; Charles Davidson, Atlanta and Nashville; David Campbell, Washington press; J. E. Martin, Memphis single; Fred. Meyer, Mobile and St. Louis duplex. On the night force are: N. R. Young, chief; E. M. Hickey, New York duplex; John R. Terhune, Southern press, New Orleans quad; Chauncey T. Raymond, Washington press. A new addition to the through circuits is "the Augusta quad," Cincinnati and St. Louis working it, thus making a more complete outlet for Southern business.

## BORN.

WEEKS.—Aug. 25, to Henry Weeks, Jr., Manager American Rapid Tel. Co., Rochester, N. Y., a daughter.

WOLCOTT.—Aug. 26, to J. E. Wolcott, Agent Valley R'y, and Manager W. U. Tel. Co., Greentown, O., a son.

## MARRIED.

CHAMBERS—CURD.—Aug. 24, Mr. W. D. Chambers, agent and operator C. S. R. R., Burgin, Ky., to Annie B. Curd.

SENFT—DETTRA.—Aug. 4, 1881, at the parsonage, near Sellersville, Pa., by the Rev. J. G. Dengler, Mr. A. A. Senft, Night Operator and Ticket Agent at Germantown, Philadelphia, to Miss Laura Dettra, eldest daughter of Mr. J. K. Dettra, of Souderton, Pa.

## THE "LATTIG" AUXILIARY LEVER NON-STICKING KEY.

PATENTED AUG. 16, 1881. PRICE \$5.00. BY MAIL.

This Key is very *fine finish*, nickel plated, and presents a beautiful appearance, is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the *indorsement of the best operators* in the country. It embodies the *only true principle to prevent a key from sticking*, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of *sticking keys*. We claim this key will never fail to make contact.

The Premium Learners' Apparatus and Outfit comprises the famous "NEW GIANT SOUNDER PERFECTED," and the "NEW CURVED KEY," placed upon a polished walnut base, with a cell of Calaud Battery, Chemicals, Office Wire and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact style, size and form of the Instruments upon which we received the highest award at the Centennial Exhibition over all competitors. There is nothing whatsoever in miniature or half made up. Everything perfectly strong and reliable, and so guaranteed, or money refunded. Our Book of Instruction, which accompanies the Instrument, contains full and explicit instructions as to the manner of setting up the Battery, running of wires, etc.

The Premium Instruments can be used upon a line from a few feet to ten miles in length. We have sold thousands and they have received the unqualified indorsement of all who have ever used them, and are pronounced the perfection of Learners' Instruments.

Only \$5.00.

Premium Learners' Apparatus.

Only \$5.00.

NOT THE CHEAPEST, BUT GUARANTEED THE BEST.

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

**SIMPLICITY AND EFFICIENCY**

### In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

#### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.  
And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

**Infringements and Worthless Imitations.**

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

49 West 18th St., New York.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, Sir WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

For sale by all dealers in Telegraphic Materials.

# A \$40 Twenty-Six Shot Sporting Rifle to \$15

WEIGHT 9½ lbs.

LENGTH OF BARREL 28 INCHES.

Price \$15.00

No. 1.  
SHOOTS ACCURATELY UP TO  
1200 YARDS.

No. 2.

AN EXTRAORDINARY BARGAIN.

## THE EVANS TWENTY-SIX SHOT MAGAZINE SPORTING RIFLE.

SHOOTS 26 SHOTS IN 60 SECONDS WITHOUT REMOVING FROM THE SHOULDER.

No hammer in the way. Throwing down the guard EJECTS LOADS AND COCKS. THE EVANS is without exception the most accurate, longest ranged, easiest loaded, quickest fired, best constructed, simplest and most perfect breech-loading Rifle in the World. The new model and latest improved EVANS MAGAZINE SPORTING RIFLE is exactly as represented in above cut. It is .44 Calibre, centre fire, 28 & 30 inch barrel, engraved black walnut stock, and sighted with graduated sights up to 1200 yards, at which distance it is more accurate than any Rifle in the world. The magazine which is located in the stock as shown in Cut Number 2, contains 26 shots, or more than double the number of any other Repeating Rifle in the world. The working parts are ALL STEEL of the finest quality, case hardened and blued and the New Patent Locking Device makes it POSITIVELY SAFE TO CARRY when loaded. THE EVANS is a great favorite with Sportsmen on account of the rapidity with which it can be fired, as well as for its accuracy at any distance from 100 TO 1200 yards. Owing to the failure of the Evans Rifle Co. we were enabled to purchase their entire stock of \$50,000 worth of perfect Rifles for less than one-third the cost of manufacture, and as these beautiful and expensive Rifles cannot be made cheap enough to compete with cheaper Rifles they will not be made again. This will be your last chance to secure one at the low Price of \$15 and we pledge our business reputation that they cost to manufacture double what we ask for them.

UNTILL FURTHER NOTICE we will send one new model Rifle as above described carefully boxed for only \$15 and when cash accompanies the order, will send a box of reloadable Metallic Cartridges and samples of the new phoenix 3 ball cartridge, a great invention in ammunition with which three balls can be shot inside a 12-inch ring at 200 yards. SEND MONEY by P. O. order or Registered Letter at our risk, or we will send the Rifle C. O. D. (collect on delivery) with privilege of examination before paying, upon receipt of \$2.00; or your express agent's written guarantee that the Rifle will be returned free if you do not take it, but we do not send the Cartridges if sent C. O. D., as this is an extra inducement to those who send cash. I have shot 600 Buffaloes at one run, and pennies from between my wife's fingers, at 40 paces. —Kit Carson, Jr. "The Evans is simply immense. I am proud of it." —Joseph Arnold, Vice-president First Nat. Bank, Lockport, N.Y. "I have used the Evans in competition with the Sharp, Winchester, and Ballard, it beats them all." —J. Frank Locke, Burnsville, Minn. "It shoots like a house a fire! I can clean out a whole band of Indians alone with it. I shall recommend them wherever I go." —Texas Jack. "It is the Strongest Shooting Gun I ever put to my shoulder, and as for accuracy it can't be beat. I know it to be the best Rifle in the market." —J. A. Boyd, of Yates' Sharpshooters. We guarantee every Rifle Perfect in every Respect. THE EVANS SADDLE RIFLE, similar to the above, except a trifle lighter and 22 inch barrel, price \$14, including swivels and straps. THE EVANS can be used as a single shot breech-loader and the magazine held in reserve if desired. Price of reloading tools for reloading shells, \$4.00, former price \$6.00. Evans cartridges can be reloaded many times. ORDER NOW, even if you have no use for a Rifle for some time to come. You will never get another such bargain and you can readily sell it for \$30 to 40, and we hereby agree if the rifle is not exactly as represented to refund the money in every instance and pay you \$5.00 for your trouble. SPECIAL OFFER. —Any one getting up a Club and sending us \$90 will receive seven rifles. We refer to any Bank, Mercantile Agency, Express Company, or Newspaper Publisher in this City. ADDRESS E. G. RIDEOUT & CO., 10 Barclay St. N.Y.

AMERICAN BELL  
**TELEPHONE COMPANY,**

Wholesale and Retail Dealers  
and Manufacturers of  
all kinds of

Electrical Apparatus and Supplies.

Correspondence solicited. We gladly furnish estimates on lines of any length, and material in any quantity.

We make our MAGNETO BELLS of unexcelled power and durability, either with frictional or tooth gearing. One of each was started in our factory in the middle of April. They have been running ever since at the rate of 240,000 armature revolutions per day of 10 hours without being touched except to oil, and are as strong as ever. Our new automatic shunt is the only perfect one made; cannot possibly fail. We are always glad to send samples.

AUXILIARY  
**MAGNETO BELL.**

This is useful for placing in kitchen, engine-room, etc., to call attention to the signals where the office is, for the time, left vacant. It is placed directly with the main line, and provided with lightning arrester and cut-out.

Owing to changing our Telephone system from Battery to Magneto, we have a large lot of our handsome nickel-plated bells, which we have put on new bases, removing all telephone connection, and will clear out at much less than cost of manufacture. They are wound to 30 ohms, with best silk-covered wire. Gongs are 3½ in. diameter and very loud, working parts incased in nickeled covers—which you like, either vibrator or single stroke.

THE BEST TELEGRAPH INSTRUCTION BOOK.

# SMITH'S MANUAL OF TELEGRAPHY

NEW AND REVISED EDITION JUST ISSUED BY

**L. G. TILLOTSON & CO.,**

PUBLISHERS AND SOLE PROPRIETORS.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

LICENSED MANUFACTURERS OF AMERICAN BELL TELEPHONE CO.

Manufacturers of all kinds of Telegraph, Telephone and Electric Light Supplies

## NEW NO. 2 MAGNETO BELL.

POST & CO.'S

## New No. 2 Magneto Bell.

CINCINNATI, Aug. 1, 1881.  
We have just perfected our New No. 2 Automatic Magneto Bell (as per cuts), and are now ready to furnish same to Exchanges and Agents of the American Bell Telephone Co. We guarantee same to ring over 10 miles of wire. We have given great attention to the construction of these bells and they will be found just the bells for short lines of all kinds—will gladly send out one bell or a case of 6 on approbation, to be returned if not satisfactory.

We call especial attention to our new switch-boards as being simple and substantial, NO CORDS TO GET OUT OF ORDER. We make them from 6 lines each up to any size wanted. Send for cuts of same. Our new battery boxes open down the front, so as to get at battery easy. We make them two sizes, for each size bell, also very fine ones for parlors and fine offices. Samples of our bells, etc., sent on application. Agents for Roebling's line wire. A full line of OFFICE WIRE, BRACKETS, INSULATORS, etc., on hand at all times at VERY LOWEST prices. Send for catalogue and prices.

## Standard No. 1 Magneto Bell, 20,000 in use.

Below we give a few important changes we have just made in our Standard Magneto Bells, making them the strongest and best Bells made. All of these important points fully covered by Letters Patent.

1st. Our Horse Shoe Magnets, large and small, are made to lift six times their weight; none are passed unless this result is obtained. This strength is secured by means ONLY KNOWN TO US.

2d. The cylinders of our engine are metallic and inclosed so as to prevent escapes of any kind, and also prevent dust from accumulating on the armature, which in a very short space of time would wear out and destroy the GENERATING POWER of the ENGINE. Other makers NECESSARILY leave the sides open.

3d. Our switch is so constructed that it prevents lightning in ANY FORM from ENTERING THE MICROPHONE, by cutting out the primary and secondary coils entirely—a feature that no other box now manufactured has, and fully covered by our letters patent.

4th. We make the Automatic Hook Bell to use with the PONY CROWN TELEPHONE. NO EXTRA CHARGE. No posts on front. Connection made at top and bottom of Bells.

5th. All Bells tested to not less than 12,000 ohms resistance.

6th. We have so arranged the RINGER, GENERATOR, and FRAME work of our Bells that they can be easily adjusted without disturbing the wires in any manner or moving the base-board or bell.

7th. Test of Standard Magneto Bells at Exposition, Oct. 1, 1880. Williams Magneto Bells rang through 11,800 ohms resistance, equal to say 370 miles No. 12 wire.

Post & Co.'s Magneto Bells rang through 19,775 ohms resistance, equal to say 625 miles No. 12 wire.

The record of this test is taken from Report of the Jurors in Class 77 on Electrical Instruments, and NEEDS NO COMMENT, as it shows our Bells have nearly double the strength of the others. The Gilliland Bell did not come in, although APPLICATION had been filed to enter same for competition. The jury awarded our Bell the HIGHEST PREMIUM—A SILVER MEDAL.

Respectfully,  
POST & COMPANY.

POST & COMPANY, CINCINNATI, O.

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY

J. H. BUNNELL & CO.,

112

LIBERTY STREET,

New York.

BEST IN THE  
WORLD.

PATENTED Feb. 15  
1881.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert, or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.  
LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of U. S. or Canada on receipt of the above price, by registered letter or money order.

THEODORE N. VAIL, General Manager American Bell Telephone Company.

## Our National Portrait Gallery.

## VII.

THEODORE N. VAIL, OF BOSTON.

Mr. Theodore N. Vail, the subject of our sketch to-day, needs very little introduction to the readers of THE OPERATOR.

Mr. Vail was born at Malvern, O., in 1845, and is a nephew of Alfred Vail, of Morristown, whose history is so familiar to telegraphers in connection with Professor Morse in the early days of the telegraph.

When six years of age Mr. Vail moved to Morristown, N. J., where he resided the greater portion of the time until the age of 21.

Here it was that he first acquired a knowledge of telegraphy, and in 1865 we find him employed in the service of the United States Telegraph Company. In 1867 he was an operator in the Canal street office of that company, but was afterward transferred to the Newark, N. J., office, relieving A. J. Burton.

During this period of telegraphic history it was customary for telegraphers to move from point to point, to satisfy their curiosity and increase their exchequer. Mr. Vail appears to have been no exception to the rule, for in 1868 he appears upon the scene as an operator on the Union Pacific road. His brief sojourn in this capacity at Pine Bluffs station leads us to suppose that the society of the place was not congenial to his tastes, nor the future prospects of the thriving settlement such as to encourage him in the study and practice of law, for Feb. 5, 1869, finds him entering the service of the government as mail agent between Omaha, Neb., and Ogden, Utah, at a salary of a thousand dollars per annum.

His experience in this western country would fill a book and prove as interesting to telegraphers as to his immediate friends. It is not chronicled, however, that he figured conspicuously as an Indian fighter, but his staying powers in a snow drift on the plains is a matter of note, his indomitable energy generally serving to bring him safely through in from thirty to sixty days.

After his appointment as mail agent, he performed special duty between Chicago and Iowa City, and during this time his energy and ability excited the admiration of Assistant General Superintendent Bangs, who caused him to be promoted to the position of head clerk, at a salary of fourteen hundred dollars per annum.

In 1869 Mr. Vail married Miss Emma Righter, of Newark, N. J., and settled at Omaha. His ambition seems to have been to own a home, and with the limited means at his command he purchased a lot, dug the cellar himself, and constructed a house capable of unlimited expansion. General Bangs finally transferred Mr. Vail to Washington to act in the capacity of clerk, in which position he remained for a number of years.

It is evident that in this position Mr. Vail appreciated the respect shown him by advancement, and consequently took advantage of every opportunity to familiarize himself perfectly in all the details of the Department, compiling information, statistics, etc., that proved not only valuable to the Department, but to himself.

There never existed a remarkably friendly feeling between Messrs. Vail and Bangs, and it is to the credit of Mr. Vail that he exhibited his worth and merit sufficiently by his work to secure the recognition of his services by the Assistant General Superintendent.

Recognizing Mr. Vail's remarkable energy,

General Bangs finally appointed him to the position of Assistant-General Superintendent of the Railway Mail Service, at a salary of \$1,600 per annum, and five dollars a day for traveling expenses.

At the time of this appointment the railway mail service may be said to have been in its infancy. The handling of the mails in transit was a new departure, and to Mr. Vail was assigned the task of perfecting the details of a system that should cause the more rapid forwarding and distributing of mail matter. What the introduction and perfection of such a system has done for the public is familiar to all.

The death of General Bangs caused the promotion of Mr. Vail, Feb. 4, 1876, to the position of General Superintendent of this service, which position he held until his retirement to engage in the telephone business.

In the early days of the telephone, Mr. Gardiner G. Hubbard conducted the business, and it was through his solicitation that Mr. Vail accepted the General Managership of the telephone business.

It was extremely fortunate in many ways that so capable a man was selected to systematize and develop the business, and it can always be said to the credit of Mr. Vail, that with all the trials and vicissitudes of the business at that time, and the vigorous and unscrupulous competition of the Western Union Telegraph Company, he never lost faith in the ultimate success of the enterprise.

To develop a business with such wide ramifications in which capital for a long time had no real confidence, organize and prepare a system that would admit of the expansion that the business has since proved capable of, was not the work of a moment, nor within the capacity of ordinary men. It required untiring energy, constant thought and application, and Mr. Vail proved himself equal to the task.

The perfection to which all the details of the vast business of the American Bell Telephone Company are carried is familiar to telephone people, and needs no explanation or comment here. The negotiations for the settlement of the contest between the Western Union and American Bell companies were almost wholly conducted by Mr. Vail, and required delicate handling. One can scarcely imagine the intricate and complicated nature of these negotiations, which occupied many months, and resulted finally in the acknowledgment of Professor's Bell's claims by the Western Union Company—a point that was contended for throughout the negotiations—and the undisputed control and possession of the whole telephone business by the American Bell Company.

Mr. Vail is largely interested in various telephonic enterprises, and has attained wealth and position, but nevertheless he remains the same genial, free hearted man that he was when working at the desk or smoking a clay pipe on the Union Pacific road. In appearance he is tall, well developed and shows little of the hard work he has done for the past ten years.

## The Telephone Convention.

The third convention and second annual gathering of members of the National Telephone Exchange Association was held at Congress Hall, Saratoga, N. Y., Sept. 6 and 7.

Several delegates and persons interested in the telephone business of the country had arrived as early as the preceding Saturday. The attend-

ance, though large, was somewhat smaller than had been expected.

The names of the delegates, honorary members, manufacturers and others connected with the business, present are as follows:

## REPRESENTING EXCHANGES.

Samuel Ivers, New Bedford, Mass.  
H. P. Frost, New Haven, Conn.  
Morris F. Tyler, New Haven, Conn.  
E. B. Baker, New Haven, Conn.  
Geo. L. Phillips, Boston, Mass.  
H. P. Monroe, Dunkirk, N. Y.  
F. W. Conn, Dunkirk, N. Y.  
Frank A. Newell, Bradford, Pa.  
William Winter, Rondout, N. Y.  
J. P. McKinstry, Cleveland, O.  
J. B. Speed, Louisville, Ky.  
H. W. Gifford, Louisville, Ky.  
H. W. Pope, New York.  
W. C. Stewart, St. Louis, Mo.  
E. T. Baker, Evansville, Ind.  
W. A. Jackson, Detroit, Mich.  
H. W. Leland, South Framingham, Mass.  
A. B. Uline, Albany, N. Y.  
E. S. Fassett, Albany, N. Y.  
Jervis Myers, Syracuse, N. Y.  
A. D. Swan, Lawrence, Mass.  
J. B. Tillotson, Nashua, N. H.  
A. M. Young, Waterbury, Conn.  
H. W. Spang, Reading, Pa.  
J. S. Ross, Nashville, Tenn.  
F. O. Vaille, Denver, Col.  
H. L. Storke, New York.  
Geo. G. Baker, Akron, O.  
R. H. Dwight, Pittsfield, Mass.

T. W. Clement, Brookline, Mass.  
C. N. Fay, Chicago, Ill.  
W. K. Morley, Bloomington, Ill.  
W. S. Reyburn, Peoria, Ill.  
W. D. Sargent, Philadelphia.  
J. C. Reilly, Philadelphia.  
J. T. McConnell, Pittsburgh, Pa.  
Henry Metzger, Pittsburgh, Pa.  
J. M. Crowley, Augusta, Ga.  
D. I. Carson, New York.  
C. E. Chinnock, New York.  
G. L. Wiley, New York.  
J. P. Davis, New York.  
H. C. Haskins, Milwaukee.  
H. H. Eldred, New York.  
W. H. Eckert, Cincinnati.  
N. W. Lillie, Boston.  
J. K. Balch, Clinton, Iowa.  
J. M. Wheeler, Toledo, O.  
Floyd L. Smith, Portsmouth, O.  
J. S. Smith, Fishkill, N. Y.  
Chas. K. Hunt, West Winsted, Conn.  
A. R. Sewall, Albany.  
A. G. Davis, Baltimore, Md.  
John Bigler, Newburgh, N. Y.  
D. S. Plume, Waterbury, Conn.

## HONORARY MEMBERS.

Eugene F. Phillips, Providence, R. I.  
W. H. Sawyer, Providence, R. I.  
Fred. S. Potter, New Bedford.  
Chas. Williams, Jr., Boston.  
Messrs. Post & Co., by E. V. Cherry and Chas. Anderson.  
The Gilliland Electric Manufacturing Co., by J. F. Gilliland.  
The Bell Telephone Co. of Canada, by C. F. Sise, Montreal.  
Geo. C. Maynard, Washington, D. C.  
Austin G. Day, by C. B. Hotchkiss, New York.  
Wm. A. Childs, New York.

## AMERICAN BELL TELEPHONE CO.

W. H. Forbes, President.  
O. E. Madden, Superintendent of Agencies.  
T. D. Lockwood, Electrician.  
C. R. Truex, T. B. Doolittle, J. M. Brown, Special agents.  
Fred Bartlett, Stenographer.

The following gentlemen were also present: J. H. Lounsbury, W. U. Manager Hartford, Ct.; W. J. Denver, W. U. Manager Springfield, Mass.; J. P. Stabler, Washington, D. C.; H. L. Shipley, New York; W. J. Johnston, of THE OPERATOR; R. W. Pope, representing the Union Electric Manufacturing Co., New York; John A. Blattan, Baltimore; F. M. Delano and J. B. Richards, Detroit, Mich.; H. A. Cole and F. W. Harrington, Boston; Geo. M. Coy, Milford, Ct.; Chas. A. Rolfe and A. H. Palmer, of the Utica

Fire Alarm Telegraph Co., Utica, N. Y.; C. E. Scribner and M. G. Kellogg, of the W. E. Manufacturing Co., Chicago, Ill.; W. Wolcott Marks, of the Bishop Gutta Percha Works, New York; D. W. Odiorne, New York; Henry M. Smith, representing the Washburn & Moen Manufacturing Co., Worcester, Mass.; Geo. H. Bliss, Pittsfield, Mass.; Frank Shaw, of the Law Telegraph Co., New York; J. H. Longstreet, New York; M. W. Goodyear, of L. G. Tillotson & Co., New York; Geo. L. Beetle and F. R. Wells, of the W. E. manufacturing Co., New York, and J. H. Bunnell, New York.

The convention was called to order at 10:30 A. M., on Tuesday, Sept. 6, by the President, Geo. L. Phillips. But three sessions in all were held, inasmuch as it became evident toward the close of the morning session on Wednesday that, by extending its length somewhat, the business of the convention could be concluded without the necessity of an afternoon session.

A call of the roll by the Secretary, Mr. Morris F. Tyler, of New Haven, showed a fair but not extremely large attendance.

The report of the Treasurer, Charles L. Mitchell, of New Haven, was read by the Secretary, giving in detail an account of the receipts and disbursements since the last report. The total receipts were \$1,524.85; disbursements, \$743.37; leaving a balance in the Treasury of \$781.48.

The reports of the Secretary and Executive Committee were then read and approved, after which a salary of \$300 was voted to the Secretary for his efficient services.

The names of Henry W. Pope and H. L. Shippy, the latter representing the well-known wire firm of the John A. Roebling's Sons Co., were presented for honorary membership, both gentlemen having paid the regular fee of \$25. They were unanimously accepted.

Mr. H. W. Pope stated that before the work of the convention was proceeded with, he desired to explain the apparent incongruity of the report of the committee on subterranean lines at the last convention, and the remarks made by Mr. Patterson thereon, the remarks referred to having in some measure contradicted the statements made by the report. He explained this by saying that the report of the committee was based upon information received immediately prior to the date of the convention, while Mr. Patterson's information was received at an earlier date.

The choice of officers for the ensuing year resulted in the unanimous re-election of George L. Phillips, of Boston, as President. W. H. Eckert, of Cincinnati, was elected Vice-President by a majority of 15. The Secretary, Morris F. Tyler, and the Treasurer, Chas. L. Mitchell, both of New Haven, were re-elected.

W. D. Sargent, of Philadelphia, was elected a member for 3 years of the Advisory Committee; and Messrs. E. J. Hall, Jr., of Buffalo, Henry Metzger, of Pittsburgh, C. N. Fay, of Chicago, and G. L. Wiley, of New York, were elected by acclamation as members of the Executive Committee.

A recess was then taken until 3 P. M.

The afternoon session being called to order, the petition of Marcus Marx for honorary membership was laid before the Association, and unanimously rejected.

Mr. Marx, it will be remembered, is connected with the People's Telephone Company, the corporation which is at present employed in the sponsorship of the claim of Daniel Drawbaugh to the inventorship of the telephone.

Reports of standing committees being called for, Mr. Tyler, of New Haven, reported on behalf of the Committee on Laws, of which he was Chairman. His remarks were generally of the following tenor:

That the subject given to this committee for consideration referred properly to three divisions, namely: the position of the exchanges with reference to the American Bell Telephone Co.; secondly, their position in relation with subscribers, and thirdly, their position in reference to non-subscribers.

After remarking that there should be no danger of any interruption of harmonious relations

under the first head, nor, in the case of properly managed companies, under the second, the third demanded careful consideration. It was possible that much legislation would be had upon this point. The only legislation in Connecticut, so far, had been at the instance of the telephone companies themselves, and was to the effect that the occupation by permission of housetops should not cause a prescriptive right to permanent occupation.

The committee suggested the appointment of a special committee on legislation. It was likely that in the near future some attempt would be made to tax telephone companies to an unwarrantable extent, and some action should be taken on that probability. The committee apprehended that many important questions would sooner or later arise; among others the one whether the companies were bound to furnish facilities to whoever calls for them. He cited the case of the Rapid Telephone Company at Bridgeport, who, upon being denied the use of a telephone, by virtue of the Bell contract with the Western Union, brought suit against the Connecticut Telephone Company, to compel them to furnish a telephone. The speaker was under the impression that the position of the American Bell Telephone Company was good and could be maintained.

The committee thought there was too much tendency to class telephone companies with telegraph companies, and legislate accordingly.

Mr. Hall, of Buffalo, thought it was desirable that telephone and telegraph companies should be considered as similar organizations; that his and other companies had obtained advantages from being so considered.

Mr. Tyler explained that the committee had no objection to taking as much advantage of the telegraph laws as possible; it was only when they had an adverse action to the telephone companies that the classification was deprecated.

Mr. Maynard inquired whether acts criminal in themselves were equally so in law if transacted by telephone, and whether the party committing such acts could be held equally responsible.

Mr. Fay instanced a case in Chicago, where certain parties represented themselves to be others and ordered goods, the goods being actually delivered. In this case the defrauded persons at first sought to hold the telephone company responsible; the company contended that any firm delivering goods without knowing to whom they were sent deserved to lose them.

Mr. Maynard, of Washington, also wished to know what punishment could be enforced in such a case or in a case where the lines were used for profane or foul language.

The President said that "Chief Justice Ecker, of Cincinnati, in such a contingency takes out the instrument."

Mr. Fay, of Chicago, stated that the city ordinance recently passed in Chicago, prohibiting the further construction of poles, housetop fixtures, or aerial lines, and providing that after May, 1883, all wires should be put underground, was being enforced, much to the annoyance of telegraph and telephone companies.

The report of the Committee on Central Office systems being called for, Mr. Fay requested a respite until the next session, as he had, since his arrival, obtained further information which he wished to incorporate.

No report was received from the Committee on Line Construction and Maintenance.

Mr. H. W. Pope, of New York, was called upon for a report from the Cable Committee, and said that Mr. C. H. Haskins, of Milwaukee, was the gentleman to look to.

Mr. Pope presented an able and exhaustive report upon subterranean lines, covering the important features of that branch of electrical engineering.

The committee reported that very little progress had been made since the previous meeting of the convention, but that the public authorities in several of the larger cities, notably Chicago, had adopted laws and ordinances tending to compel the construction of subterranean lines. The report contended that the enforcement of such laws and ordinances would result in bankrupting the telephone companies.

In arguing the practicability of subterranean construction, as affecting the telephone, the report says:

"It is questionable whether a universal subter-

anean system will ever be perfected that will accommodate alike, and without interference, the various classes of electric conductors to be encountered in cities of upward of 100,000 inhabitants, and it is apparent that whatever system is introduced must be universal, accommodating the wires of all corporations."

The great expense, together with the difficulties to be overcome in subterranean construction, suggest to the committee that aerial systems of cables could be utilized to advantage.

The general introduction of aerial cables as a temporary expedient opens up the question as to the feasibility of a similar universal method of carrying wires that is practical, economical and convenient. If universal, few streets need be encumbered, and with light ornamental supports in combination, for example, with street lights, it is not probable that serious objection would be offered, inasmuch as it would be a radical improvement upon the present unsightly structures.

We have seen an elevated railroad system adopted and constructed in preference to all other plans suggested, because of the very same advantages it has over either underground or viaduct roads that the aerial telegraph has over the subterranean, and because capital could not at the time be enlisted in an enterprise so fraught with difficulties.

None of the Elevated wire ways patented or suggested, however, seem to contain all the advantages necessary. With a light and ornamental support, the requirements of the public could be satisfied and the introduction of subterranean lines obviated entirely or confined wholly to important trunk routes.

The only two improvements for subterranean construction submitted by the Committee as worthy of note were the "Delany Button" and "Delaney Lead Cables," both of which were described and commented upon at length. The former consists of naked copper wires passing through elliptical glass buttons—the buttons standing on edge and being packed tight together, the whole forming a flexible cable which can be easily passed through a pipe or conduit. The latter cable is of a flat form, made of lead, with wires occupying the same plane. This cable has an advantage in that it surely overcomes induction.

The aerial system of Mr. Geo. B. Scott was explained at length, and in view of the fact that the committee intimate a preference for aerial systems, it is worthy of consideration by telephone companies. Such a system is now being constructed at Boston on a limited scale.

The committee, in conclusion, cautioned members of the association of the danger of too strongly advocating subterranean construction, and wisely impressed upon them the fact that whatever is done above or below ground should be permanent and capable of expansion, and as to cables for every purpose, permanent and reliable insulation is the most desirable and economical.

No discussion following this report, the President called upon Mr. H. H. Eldred to give an account of his observations in telephone circles in Europe. Mr. Eldred gave some interesting statistics concerning the progress of the telephone, and of telephone exchange systems in Europe, recapitulating the recent war between the government of England and the telephone companies.

He spoke of the "Hunning transmitter" as one of great merit, the right for which in the United States, he said, had lately been acquired by the American Bell Telephone Company. He described in detail the system in use at Paris, where the wires are all underground, all metallic circuits, and each having but one station. He said that the exchange at Paris was the best working and the best managed one he had seen. He also gave an interesting résumé of the progress and prospects of telephony throughout the world. When describing the Belgian exchanges, he said that phosphor-bronze wire was much used there.

This elicited some discussion, inasmuch as phosphor-bronze in this country, weight for weight, has nearly the same electrical resistance as iron, while it is much more expensive, and would therefore necessarily be used in smaller sizes.

An adjournment at this point was voted until the morrow, after the election of Messrs. Beach and Hunt, of West Winsted, Conn., to membership.

By means of a Western Union wire, the Albany Telephone Exchange was connected to Saratoga, and many conversations between Albany and Saratoga were held in the course of the day.

The session of Wednesday, Sept. 7, opened at 10:30 A. M.

An excuse was received from Mr. Engle regretting his absence, which was caused by pressing business, and promising to report fully upon the subject of fire alarms next year.

Mr. Fay, of Chicago, presented and read a copious report on Central Office Systems and Apparatus, which was well received.

He said he had received returns from but twenty-two companies, but hoped for much fuller and more complete reports next year.

In view of this expressed hope, he explained in detail the various subjects embraced in the forms sent out by the committee. These were: System employed; kind of switch-board used; maker of switch-board; space occupied by apparatus on floor; expense of fitting offices; number of wires; number of stations per wire; number of operators employed; average number of calls per day; average pay for operators, and average speed of connections. It was ascertained from the reports received that more cord switch-boards were in use than plug switch-boards, but that more wires were connected to plug switches than to cord switches, showing that the larger exchanges favored the plug switch. The majority of wires in use by the exchanges making returns have more than one station connected on them.

The speaker then read a list showing the number of subscribers of each exchange reporting. The four exchanges heading the list were, respectively, New York, Chicago, Cincinnati and Philadelphia. The three exchanges receiving on an average the greatest number of calls were, first, Chicago; second, Cincinnati; third, New York. The average cost of connection was highest in Buffalo, Chicago and Cincinnati.

Of the exchanges reporting upon the speed of connection, Clinton and Lyons, Iowa, came first, claiming an average time of two and two-tenths seconds, while New York came last, showing an average of 60 seconds.

Mr. Balch, of Clinton, explained that the wonderful speed claimed by his exchanges was accounted for by the fact that upon receiving a call his exchanges were in the habit of connecting the two lines together, and permitting them to ring up each other.

The average time required in making connections of the twenty-two exchanges reporting was twenty-six and eight-tenths seconds.

Six exchanges were operating individual bells, and five working upon a listening system. Three exchanges preferred male operators; eleven preferred female operators.

Mr. Pope thought if some uniform rule were adopted in gathering statistics, the information would be more comprehensive and valuable.

Mr. Fay said the expense incurred by exchanges in obtaining accurate information was very considerable; he commented upon different methods of calling, and to some extent advocated the method of putting two together on the switch-board and ringing the two simultaneously.

The Committee on Cables not being present, Mr. Sargent, of Philadelphia, reported in behalf of the Committee on Electrical Disturbances.

Mr. Sargent read a most careful, exhaustive and able report, comprising statements of the cause and effects of many of the troubles experienced by telephonic electricians. These were static and dynamic induction, leakage from one wire to another, earth and atmospheric currents, defective insulation, bad joints, and defective groundwires. He canvassed the recent discoveries of the French electrician GaiFFE, that the mere vibration of one wire sent induced currents into other wires near it. He explained the theory of the anti-induction cable, discussed interference caused by electric light wires, troubles caused by lightning, quoting from the recent article in THE OPERATOR upon that subject, and showed how many of these troubles could be remedied.

He also spoke of the electrical properties of phosphor-bronze wire, but without in manner advocating its use, and commended the porcelain insulator.

Mr. Pope remarked that to many of the delegates the only porcelain insulator known was

the ordinary knob, and he thought it might be supposed that was the insulator alluded to by Mr. Sargent, whereas, as an insulator, it was without great value.

Mr. Sargent said the insulator he spoke of and commended was the large insulator which is universally used in Europe.

Mr. H. C. Haskins, of Milwaukee, advocated a new compound wire, made at Ansonia, Conn. It consists of a steel core, having a thick layer of copper electrically deposited on it. He claimed for it lightness, high conductivity, and great durability.

Mr. Lockwood, of Boston, discussed at some length the report of Mr. Sargent, entering into an explanation of the terms static and dynamic induction, and showing how the telephone was affected by both troubles.

The transmitters furnished to exchanges were spoken of by Mr. Hall, who thought that they were not as good as the older ones. He thought the carbon buttons were imperfect.

Mr. R. M. Bailey, of Tyrone, Pa., said that a poor transmitter, it had been his experience, was sometimes improved by reversing the battery.

Mr. Sargent said he also had noticed that the transmitters were not so good as they had been, and ascribed the trouble to the use of a lighter platinum spring. After some further discussion upon this subject by Messrs. Wiley, Chinnock, Lockwood, Maynard, Gifford and Ross. Mr. Maynard was called upon for a report of the Committee on Auxiliary Systems, and reported at length, showing what had been done in various cities in that direction.

The Committee upon a Telephone Journal and Exchange Statistics failed to report.

In regard to the Committee on Rates, Mr. Hall, of Buffalo, thought it not necessary to make a full report until next meeting.

Mr. H. C. Haskins reported that the Milwaukee exchange had adopted a modification of the Buffalo toll system.

Mr. Hall recapitulated briefly his toll system experience, adding that since its adoption the Buffalo exchange had made a slight increase in subscribers.

It was voted that the next annual meeting should be held in Boston.

Several resolutions, amending the constitution and conferring powers upon the President to appoint honorary members upon committees, were proposed and voted upon so far as the constitution permitted, others being laid over until the next meeting.

Mr. Gifford offered a resolution, empowering the committee on rates to collect within thirty days from exchanges a schedule of rates charged, a copy of the information thus procured to be sent to each member of the association. Carried.

The number of committees was reduced to eight.

The association then adjourned to meet in Boston on the Tuesday following the first Monday in September, 1882.

During the afternoon it was ascertained that Professor A. G. Bell was staying at the Grand Union Hotel, he having that day arrived. He was introduced to many of the delegates and expressed great pleasure at being present upon such an occasion.

Notwithstanding the intense heat, and that the acoustic properties of the hall were not what they might have been, the proceedings of the convention were most interesting, and a pleasant and profitable time was passed by all who attended.

#### A Delegate Who Was Late.

To the Editor of The Operator:

SIR: I am thus far on my way home from Saratoga, where I went with the expectation of feasting my optics upon a very fine display of apparatus telephonic, and storing my "cable house" with information that would inform. From a printed postal received from the Utica Fire Alarm Telegraph Company, I got the impression that the exhibition opened on the 6th and continued four days—6th, 7th, 8th and 9th inclusive—so I consumed two days along the route, and arrived at Congress Hall bright and early Thursday morning, Sept. 8. Here I learned, greatly to my disappointment, that the "hello-ers" had beaten the Arabs all hollow in packing up quietly and getting away quick. I was not the only one that was disappointed, for many others arrived late Wednesday evening,

and quite a number came in on Thursday. It strikes me that it would be a pious plan for some one to know how long these exhibitions would be continued, and so state it that those desiring to attend might govern themselves accordingly—and not get left.

I lay over a train at Troy, and found a nicely arranged exchange, with the Utica circular jack in use. The "Snell" was one of the kinds that I particularly wanted to examine; so I dropped off at Springfield and took a peep at the three 50-line tables in use there. They are wholly composed of the "Snell jacks," drops, etc., and all metal work gold plated. Mr. French, the chief operator, is dead in love with the system, and will not be seeking for a divorce very soon.

Can't say that I should cry to sit up nights (or day time, either) with the system in use here (Worcester)—the old Western Union switch, with many odd and more or less useful attachments spread around here and there, which give it the appearance of too much of a muchness. Mr. Wilson, the gentlemanly chief operator, shows it up so nicely, however, that one would almost believe it the only system worth speaking of. Mr. Wilson, by the way, was one of the disappointed ones at Saratoga—arrived too late.

Washburn and Moen have done much to bring Worcester before the electric arena, but when it becomes generally known that it is the birth place of the "Wiggle-wag," then she will be a famous burgh. Have you ever seen the "Wiggle-wag?"

Here I also found that rare old genius and electrician, Prof. E. J. Leland, and what he can't show you in the electric line is not worth seeing—in fact, he has got more "fixin's" to the square inch up in his rooms, than I ever did see, and he is such a jolly fellow that you'll be sure to miss the train if you get in his company.

Well, as it is nearly car time, and as I want to reach the "Hub" to spend Sunday, I must cut it right short. Telephonically yours, N.

WORCESTER, Mass., Sept. 10, 1881.

#### The Telephone and the Electric Light at the Paris Exhibition.

[From The Operator's Special Correspondent.]

The exhibition was not really opened in its entirety until Saturday, Aug. 27, when the Palais de l'Industrie was thrown open to the public for the first time in the evening. On the preceding evening another "special occasion" was got up for the journalists of Paris, and every one, exhibitors and all, was excluded, in order that proper honors might be shown the members of the press. No ceremony was undertaken, the visitors merely walking about the place inspecting the different objects of interest and commenting upon the qualities of the different electric lights. When they had satisfied themselves that the show was a big one, they quietly walked out and went home. On the next evening, Saturday, the public was admitted, and in a very short time after 8 o'clock, the opening hour, the building was crowded. All day Sunday and Sunday evening the crowd was greater, if possible, than on the preceding day.

An effort has been made by the International Sunday Observance Society to have the English speaking exhibitors close up on Sunday. It is hard to say whether their honest efforts had any weight or not, but to the credit of the English and Americans be it said that nearly all of them observe the day, only those keeping open who use or furnish steam power, and have lights on exhibition.

Of the twenty-five or thirty different kinds of lamps here it is as yet almost impossible to say which is the best. The Brush stands high in favor among the arc lights, but each of the incandescent systems, Edison's, Swan's, Maxim's and Fox Lane's, has its particular friends. As far as the light-giving properties and steadiness of the different lamps are concerned, I cannot see but that one is about as good as another. The principal point is, "What do they cost?" and that remains for the

jury to decide. The jurors have already been practically appointed, and will begin their duties at about the same time as the Congress, on the 15th inst. The United States will have seven representatives, consisting probably of members of the Commission. The entire jury will consist of about 150 members.

The American Commissioners received a note a few days ago from the French Commissioners, saying that the historical portion of the exhibition was likely to prove a failure, because so few countries had sent their historical apparatus. The French authorities requested that an effort be made, while there was still time, to have American inventors send their "first attempts" along as soon as possible. It is understood that among the questions to be decided by the Congress is that of the priority of invention of the telephone, and this historical material is to be used as an aid in settling that question. Professor Gray has sent for his musical telephone and other of his earlier apparatus, and Professor Bell has been requested to send on his earlier inventions also.

Dolbear's new telephone is on exhibit in the American section, and is a wonder of simplicity. Every person who has had much to do with condensers has noticed that peculiar "thud" sound when they are charged or discharged. The Dolbear telephone is nothing more than a small condenser, consisting of two tin plates placed a little distance apart so as to make an air dielectric. Any transmitter can be used, although Professor Dolbear has his own particular pattern. Dr. Hertz showed me his new telephone the other day in his laboratory; it is not on exhibition here. The receiver is merely a small condenser, made in the ordinary manner, with tin foil and paraffine paper. It is constructed in the form of a hand mirror; in fact, some of the models are finished with a mirror in the back. Except that they have two binding screws to make connections with the two series of sheets in the condenser, they could not be distinguished from the well-known toilet article. When we see such results from so common and simple devices, we cannot but wonder that the discoveries were never made before.

In my last letter I said that Edison was going to light up some concert halls in the Champs Elysées, in addition to the grand staircase and his own room. As he would have to pay duty on everything used outside of the exhibition building proper, it has been decided to confine his exhibit to the inside. Unfortunately, his exhibit is still in a very backward state. His large generator that we have heard so much about has not arrived, and will require some days to place in position when it does reach Paris. In the meantime, he is renting motor and generator power sufficient to run his lamps. It is often remarked that where other inventors have improved lamps, or generators or other portions of a system, Edison has an entire system of his own from the generators up to the lamps.

The telephonic concerts have been commenced with great success. In a heavily tapestried room off the gallery are a number of Ader telephones, to which the public is allowed access on the payment of a small supplementary fee, and given the use of two telephone receivers for a few minutes. The conductors are laid underground to the Grand Opéra, and the transmitters are there placed just beside the prompter's box. The effect is wonderful. On Friday evening I was favored with a few minutes of "Robert le Diable," which was then being performed. The voice of M. Vilaret could be heard with almost as great distinctness as in the Opera-House itself, and the same was the case with the orchestra, while even the plaudits of the *claque* were perfectly audible and distinguishable. The distance indeed, between the two localities was practically suppressed, and there seems no reason why at some not distant date people may not be able to enjoy the opera at reduced prices in their own homes.

While there are a great many things of an electrical nature here that are curious, there are also a great many others that are called electrical in which electricity plays a very small part indeed. There is, for instance, an electrical incubator, by which one would suppose that chickens were hatched by electricity in some way, but electricity has nothing to do with it except to ring a bell when the thermometer placed inside makes a connection that indicates that the tem-

perature is either too high or too low for the welfare of the coming chickens. There is also a glass house containing several varieties of flowers in pots, and having one-half painted black, indicating seemingly, that there may be found a process for developing flowers by the electric light only. But the whole thing is only a scheme by a glass-house maker to advertise his conservatory.

The exhibit of American telegraph instruments is extremely meagre. Latimer Clark, Muirhead & Co., as sole European agents, have a little case of instruments made by the Western Electric Company, and they are the only things on exhibition as specimens of American workmanship. The English and Germans are far ahead of us in the enterprise shown in this respect, although what few American instruments there are here call for unbounded praise on account of their neatness and usefulness. The American key excites much surprise in the foreigners, the Germans, especially. They don't like it. They say it is not large enough, and when a person uses it he has nothing tangible in his hand to show that he is working. You know a German key consists of a straight bar of brass about six inches long and half an inch square, with a knob of hard rubber stuck on near the end so large that the operator can get hold of it with his whole hand as if he were working a pump handle. Well, when we remember that a speed of 20 words a minute is considered good average work in Europe, perhaps their key is good enough for them for the present.

#### The Jury of the Electric Exhibition.

A cable dispatch from Paris says the apportionment of the numbers of the members of the jury of the International Electric Exhibition is finally settled as follows: France, 75; Belgium, 11; Great Britain, Germany and Italy, 10 each; America, 7; Sweden, 5; Switzerland, 4; Spain, Norway and Holland, 3 each; Hungary, Denmark and Japan, 1 each. People now begin to appreciate the difficulties the jury will have to contend with. Some anxiety is expressed in regard to their appointment. Mechanical as well as electrical experts are required. There is some fear that if this work is not begun immediately it cannot be done satisfactorily. Even if a number of incandescent filament lamps be started now and kept working until November, when the exhibition closes, it is improbable that the durability of these lamps will be known. M. Rysselberghe, director of the Brussels Observatory, lectured Sept. 9 at the Electrical Exhibition in regard to apparatus for registering meteorological changes. He specially explained the widespread organization of the United States Signal Service Bureau. His audience was conducted through the United States Signal Office exhibit.

#### The Telegraphic Situation.

The chilling blasts of the public press which have been howling all around the Western Union for a month past, have had the effect of improving its service, while the salary scalpers, who crawled into their holes at the first alarm, appear now to have drawn the holes in after them. The management squirmed a good deal about the expense of creating extra facilities at Long Branch to accommodate the press and public during President Garfield's sickness, and for a time the service was execrable; but the sight of an improvised "pony express" carrying press dispatches in the style of 50 years ago, and of carrier pigeons flying in all directions, shamed them into activity, and some of the necessary work was done a week after the President arrived, instead of a week in advance of his arrival. The service there is not yet all that it should be, if they had anticipated the demands of the emergency instead of waiting to see what the emergency would demand; but they are fairly good and the work is being done as well as the finest operators in the world can do it with the present facilities.

On the 26th ultimo the Western Union Company issued the following order, which, if sincere,

is indicative of at least good feeling on its part, and which we are sure will be reciprocated by the operators:

#### To all Superintendents:

It is hardly necessary to call your attention to the continued anxiety in the public mind for the latest news from Washington, and to the desirability of having all offices manned to-morrow. Our employés have nobly responded to the demands of the situation, and I am sure will not be unwilling to undergo the further strain upon this trying occasion. Though the company makes no extra charge for the extraordinary bulletin service it is rendering, the employés should be paid for all extra time and commended for their devotion.

D. H. BATES,  
Assistant to the General Manager.

Smarting under the severe criticism of the press, the Western Union manager at Boston was recently rash enough to call personally upon the *Commercial Bulletin*—that paper and the *Shipping List*, in that city, having been most prominent in demanding better telegraphic service for their merchants. He received for his pains about a column of proofs of the Western Union's bad service, in the shape of letters from prominent business firms. The *Bulletin* (September 3) plainly tells this manager that "almost every complaint made in the *Bulletin* has been made again and again at the office of the company, the manager to the contrary notwithstanding. We have before us the names of a dozen merchants who have gone personally to the company's office repeatedly during the last year and inquired why their dispatches to Chicago were continually delayed, and also why delays in delivery should exist here in the city. It may be that all these complaints have not reached the manager; if so, we respectfully suggest that he select subordinates who know enough to report matters of so much importance to their executive officer. One gentleman, in addition to complaining in person at the office, has written three times to the manager, but has received no notice of either communication."

The *Bulletin* then substantiates its charges by letters from the leading merchants. One man says, among other things: "I received a letter a few days ago saying: 'We did not answer your telegram of such a date, supposing you were on your way to Chicago, it being dated from Buffalo.' Again, a dispatch was sent me from Chicago Aug. 19, about 12 o'clock, reaching my office 4:30 that afternoon; one from the same party started an hour earlier reached me the next morning at 8:25. It has become so uncertain when a dispatch will reach its destination, that I have about given up sending them. Another thing that you have not spoken of: Is there any reason why it need take from 30 minutes to an hour and a quarter for a dispatch to be delivered at my office, which is within five minutes' walk of the main office?"

Another man says: "These delays have greatly restricted our business, besides costing us hundreds of dollars at various times during the past year. For some weeks previous to the publication of your article, the time consumed in getting our telegrams to our office (three minutes' walk from the main office) has been twenty-five to fifty-five minutes after the receipt of the messages in Boston. We have occasional instances where our messages are not delivered at their destination till the day following the sending of same, although they were started in season to have secured replies by day message, had the service been only moderately efficient."

Another merchant goes to the root of the question by saying: "Boston merchants should have an independent line to the West, and if the Western Union will not provide it, let us look elsewhere, and promptly, too."

Still another one intimates that the management has some little "private" arrangement as follows:

"Here is a case in point: Yesterday I was very anxious to get a return dispatch. I remarked that I disliked to send mine, fearing I should have to wait too long. 'I'll get you an answer inside of twenty minutes,' said a friend at my elbow. My friend and I sent duplicate dispatches. He received an answer in twenty-five minutes; I received mine four hours and a

half later. This is regularly done, and I am prepared to prove it."

All this is to be found in the *Boston Commercial Bulletin* of Sept. 3. That enterprising paper seems, however, to be mystified as to the cause of all this trouble.

The New York *Herald* seems to have started a kind of a go-as-you-please contest among the anti-monopolists. "J. S. B." first writes to the *Herald* of his grievances with regard to bad service over the Western Union lines. Following him "A. R." writes as follows:

I can beat "J. S. B." I sent a message from Jersey City at ten minutes to nine A. M. to Wurtsborough, Sullivan County. It got there at a quarter-past three P. M. I was there by train three hours ahead of it. The above can be proved by reference to the dispatch.

Not to be outdone, "E. L. S." writes to the *Herald* as follows:

"A. R." has beaten "J. S. B." and I think the following beats both: I sent a message of sympathy to Harlem the 5th of August last from the Western Union's office on Broad street, and it has not been delivered yet. On calling a week later, I was told I could repeat it.

Making due allowance for the usual number of crabbed old bachelors and cranks generally who are brought to the surface during these discussions there seems still some grounds for their complaints when we compare them with those made in other cities between Boston and Kansas City.

None of our esteemed contemporaries have, however, attempted to go to the bottom of the question. They have not stated that the trouble is caused principally by the company's failure to persuade its men to work longer hours than usual for less money than formerly; and that, in consequence, those good men who have not left its service, remain only to do perfunctory work, and as little even of that as possible.

The past few days have developed the fact that the Mutual Union, American Rapid, Canadian Mutual and Baltimore & Ohio systems of telegraph have entered into a combination by which some 50,000 miles of wire will be placed under one management. The Baltimore & Ohio, it is stated, has been in communication with the Mutual Union Company, which covers 35,000 miles of itself, and has six wires in Baltimore and twelve from New York to Boston, and also with the American Rapid, which has three or four wires between New York and Washington, with the view to combining. The Canadian Mutual may enter the pool also, as the Baltimore & Ohio, although it has a good commercial business, is in vital need of an outlet, and a combination with these three lines would be a great advantage. The Mutual Union is running its lines west, and the Baltimore & Ohio has many points in that direction to cover. President Garrett has already announced his intention, emphatically and definitely, to fight the Western Union. The Baltimore & Ohio line now covers 10,000 miles, and there is nothing so much required as several outside lines to carry off the business being done by the Baltimore & Ohio; and the latter, too, will be in a great measure helpful to the other three lines, so that the combination would be of advantage to all concerned. Speaking of the influence which the combination is likely to exert on the Western Union, Mr Stewart says the effect upon it would be noticeable, for if it were so when the company was capitalized at \$40,000,000 it will be more so now that its capital is \$80,000,000. By the terms of the contract the Mutual Union Company is to have complete control of all the wires, paying therefor, in addition to a certain stated sum as rental, a percentage upon the business transacted over the lines. It is also stipulated that the telegraph people transmit all messages pertaining to the business of the railroad. Dispatches from the officials of the road to their subordinates, in reference to the running of trains, and all messages pertaining to the management of the road, are to have precedence over outside business. The expenses attendant upon keeping the telegraph property in repair are to be borne jointly by the telegraph company and the railroad company. The contract is, in its essential features, similar to the one that formerly existed between the Baltimore & Ohio railroad managers and the American Union Telegraph Company. When the American Union was consolidated with the Western Union and the Atlantic & Pacific companies, it became

necessary for the railroad managers to make some new arrangement, and hence the contract with the Mutual Union people has been agreed upon. It is not probable that there will be any important changes among the employes of the telegraph line. The lease is for five years, with a privilege of renewal for a like term.

The Mutual Union, notwithstanding this contract, has wisely decided not to open for general business until the middle of October or the first of November, although the work of building the lines is practically completed now in a large part of this district. The Board of Directors have resolved not to open any of their offices for public business until about a few of the least important offices are in a condition to receive and transmit messages.

The telegraph system of the Baltimore & Ohio consists of four lines of wire, in good condition, extending over the whole length of the road—435 miles. When the Mutual Union Company is opened for business its lines will extend from New York to Washington City, thence to Cumberland, Cincinnati and Pittsburg, and another division will connect New York with Philadelphia, Bethlehem, Easton, Allentown and other cities in Pennsylvania. The eastern division will run from this city to Albany, Saratoga, Troy, Boston, Pittsfield, Springfield, and thence along the New England coast to Maine, covering Providence, Newport, Fall River, Taunton, etc. In all this territory men are at work completing lines. There will be no wires south of Washington city for the present.

Since our last issue, a charter has been granted in Canada to the Canada Mutual Telegraph Company, under the Joint Stock Companies act. The organization promises to enter the field as a vigorous rival to the recently-amalgamated Montreal Dominion companies. The capital of the new company is \$1,000,000, and, from all that can be learned, it is the intention to press forward the construction of a line as far as possible this fall, and complete a system which will extend to every part of the Dominion as soon as the frost is out of the ground next spring. It is understood that the capital of the new enterprise is all subscribed, the first installment is paid in, and that arrangements have been made with the new Mutual Union Company of this city, for an interchange of business.

Mr. Keene's Postal Telegraph is still talking, and of course getting all the free advertising it can, but we see no evidences of solid work, and, in fact, expect little this fall.

The Western Union has, in consideration of \$120,000, secured from Wm. Callow, of Baltimore, his interest in all the telegraph lines and franchises formerly belonging to the Bankers' and Brokers' Telegraph Company, including five wires from New York to Philadelphia and three from Philadelphia to Washington. The Western Union had leased these lines since 1871. The transfer was recorded on the 6th inst., the instrument being dated Sept. 5, 1881. On the previous Monday a similar instrument, by which John Howard Wells, of this city, transferred to the corporation named his interest in the same property for a like amount, was recorded. The lines of the company were transferred to Mr. Wells by the trustees in 1871 and he leased them to the Western Union Company.

"The Brotherhood of Telegraphers" has become strong enough to call forth secret letters from mousing officials to various local managers inquiring if "the Brotherhood were worth while looking after," and "how it stands." A majority of the replies state that "it is entirely harmless, so long as the consolidated company treats its men like the late American Union did, but"—it is that "but" that makes them sick.

It is said that the wires of the Mutual Union Telegraph Company will be open for business to all important cities about the 1st of November. Mr. Gamble, late General Superintendent of the Western Union lines on the Pacific coast, has resigned, and accepted the position of general manager of the new company. The lines are being extended to the Southern cities, and it is said that by the 1st of November the general office will probably be connected with four-fifths of the great commercial towns in the country.

The main office of the Mutual Union Telegraph Co. in this city will be in the London, Liverpool & Globe building, corner of Pine and William streets. As soon as this office can be fitted up, probably about Nov. 1, the company's lines will be opened for business.

## More Press Criticism of the Western Union.

The following extracts from recent issues of several different New York daily papers show how business was handled during the recent rush at Long Branch.

The principal cause of all the complaint is given by a well-known telegrapher of this city as follows:

"Of course, it is unnecessary to inform you that four-fifths of the operators here, as well as elsewhere, are mere students. The good men are leaving the business on account of the low salaries paid by the Western Union."

An intelligent correspondent at 195 Broadway, says:

"X has been trying to reorganize this office and Y the Chicago office. They cannot do it, simply because the force is about 50 below what it should be. I understand that X has recommended an increase of 40 operators in this office."

"The underlying trouble is that when they get good men they, the company, will not pay them anything but starvation wages, and they leave the first opportunity. Business is not transacted now-a-days, it is simply butchered."

"Operators are put on first-class wires and business who have not yet acquired the rudiments of the Queen's English."

## FAILURE OF THE TELEGRAPH SYSTEM AT LONG BRANCH.

[Commercial, Tuesday, Sept. 6.]

The utter failure of the telegraph authorities at Long Branch to make sufficient provision for such an occasion as that presented to-day, is the only excuse that can be advanced for the inadequate dispatches in our later editions. The *Commercial* had made provision for full and complete reports of the President's arrival at Elberon, but when the telegraph company failed, all plans were futile.

[Commercial, Wednesday, Sept. 7.]

The wretched handling of press dispatches at Long Branch yesterday by the telegraph company is almost without precedent. There seems to be no excuse whatever for the mismanagement and bungling. Common sense would seem to have dictated that the wires should be placed in the most accessible spot, where they would prove of the utmost service to the public. Nothing of this kind was done. No effort apparently was made to please the public. Correspondents were forced not only to employ their own messengers to carry copy to the West End Hotel, a mile and a half away, whence it was carried to the main office at East Long Branch, another mile and a half away, but to see dispatches of private individuals given precedence over public news under their very eyes. At the West End, Mr. Casey, the popular manager, had his hands full all day long, and for all he worked like a beaver and displayed industry and intelligence that won the admiration of all who met him, at times he was taxed to the utmost to get off his dispatches to the main office in time to please all. It was not till late last evening that all the additional wires were in position. If the same energy and enterprise had been exercised in the telegraph line as in the railway not a complaint could be made. But Mr. Stearns was up all night to finish his great work, and he finished it; and when the time came the President's train passed over the 1,100 yards of railway that was constructed in just sixteen hours. Foresight, energy, intelligence, a willingness to accommodate and a love for labor were here manifest. If Superintendent Brown had been as willing to please the public as Mr. Stearns the President, the warmest praise would now be accorded him, in place of severe condemnation. In this age of progression it is the man who anticipates the emergencies who succeeds and gains credit, not the man who waits to see what the emergency is going to be like, and then trims his sails accordingly.

## FAILURE OF THE TELEGRAPH SERVICE.

[Post, Tuesday, Sept. 6.]

The explanation of the fact that we have not a full account of the President's arrival at Long Branch in this edition is the inexcusable failure of the Western Union Telegraph Company to provide proper telegraph facilities at Elberon. Most of our dispatches from there to-day have

been delivered two hours or more after they were filed; and since the arrival of the President's train the dispatches have stopped entirely, both those of our special correspondents and of the Associated Press. Our dispatches in the third edition explain how it happens that the telegraph company serves the public so poorly at this exciting time.

[Post, Wednesday, Sept. 7.]

The correspondents of morning newspapers from Florida to San Francisco have filed their last dispatches more than an hour ago, but even they are haunted by misgivings of renewed complications to this unfortunate Long Branch division of the Western Union Telegraph Company, which has proved so wholly inadequate to do the work expected of it. Yesterday's early dispatches told you how only one wire connected Elberon with the outside world all day; that wire was monopolized by Attorney-General MacVeagh, who refused to allow it to be used for any except government business. Such was the condition of things hours before the Presidential train arrived, and all careful correspondents went down to the West End Hotel, a mile and a half along the coast, to make sure that when dispatches were sent down there by special messengers there would be no delay in their transmission. The appearance of affairs in the Western Union office of the West End Hotel was not reassuring. There had been talk about fifteen operators at the West End; but at 11 o'clock in the morning there were only two; vague promises as to the other thirteen were held out, and the office chief insists that all will go right. What the local officers of the Western Union Company stationed at the West End Hotel understand as "all right" may be judged by the following history of one dispatch sent off from Elberon at five minutes after two o'clock: A messenger rode from Elberon to the West End at a break-neck pace and got the dispatch there at ten minutes after two. "Very sorry," say the people in the Western Union office, "but we cannot send that dispatch from here; but we have a boy who will take it down to the Mansion House, where there are plenty of operators." "Well, where is your boy?" inquires the messenger. "He'll be here soon; he's around somewhere near, getting his dinner." The messenger, who has strict orders to be back at Elberon within half an hour, waits ten minutes for that boy to get through his dinner, and with him wait a dozen correspondents or messengers of afternoon newspapers all over the country. The press of the country waits while a ten-year-old country boy eats. When the boy does appear at half past two he is not allowed to go off at once, but is intrusted with some piece of the quadruplex instrument which broke yesterday and can be repaired only by a certain jeweler, living a mile from the West End Hotel. Of course the dispatches are all too late for the regular last editions of the newspapers. Said one irate correspondent: "If the local manager of the Western Union Company was made of the right stuff, he would have hired in advance every boy in Jersey out of petticoats rather than have this happen."

#### REASONS FOR THE DELAY.

The following, published in Mr. Gould's paper, was written by Night Manager T. Dolan:

[World, Sept. 7.]

The officers of the Western Union Telegraph Company have been hard pressed since the President's removal to Long Branch to comply with the immensely increased demands made upon them for the transmission of messages concerning his condition.

Mr. Downer, the manager of the company's office in New York, explained yesterday to a *World* reporter the difficulties which had to be encountered, and the measures taken to meet them. He said: "We have eight wires running to Long Branch. When it was finally decided on Monday to remove the President to Elberon, we could not possibly put up any more wires, as such an undertaking would require at least two weeks. However, to meet the additional demands made upon us we quadruplexed the wires, which necessitated the removal to Long Branch of 1,000 cells of battery, a number of instruments, stands, tables, etc. We also sent a force of twenty-one additional operators, eight of whom we brought from Washington. From our main office in Long Branch to West End is over a mile, and from West End to where the President is staying,

a little below the Elberon Hotel, is about the same distance. We have only one wire from West End to Elberon, so in order to give every facility in our power for the speedy transmission of news, we established a pony express between those points, employing three ponies. Of course, some newspaper correspondents and others may have felt aggrieved at the unavoidable delays to which their dispatches were subjected by the pony express from Elberon, but when it is remembered that Long Branch was full of correspondents from all over the country, even from small inland towns, all anxious to get the wires at the same time, it had to be a case of 'first come, first served,' and those that chanced to be a little behindhand could not possibly have been accommodated better with the means at our disposal."

#### BAD TELEGRAPHIC SERVICE.

[Herald, Sept. 9—Editorial.]

Why has the Western Union telegraphic service so sadly deteriorated recently? Nearly every mail to the *Herald* brings numerous complaints from business men and the non-commercial classes on the subject. The general tenor of these communications is that messages from near as well as distant points take hours and hours in transmission, thereby causing inconvenience and in many cases anxiety, loss of time, and, frequently, loss of money. To give one out of many instances of inefficiency: A dispatch filed at Long Branch a few days ago at three o'clock in the afternoon was not delivered until nearly three hours later at its destination on Broadway nearly opposite the Western Union building. The *Herald's* own experience in the receipt of its special dispatches bears out these charges of carelessness, mismanagement, or whatever other term the company may choose to call it. Matter intended for publication is delivered in the most unsatisfactory manner. The dispatches are late, and we know it is not the fault of our correspondents. This indifference to the interests of the public and the press is simply scandalous, and the grievances of which they so justly complain should be promptly redressed.

[Chicago Tribune, Sept. 11, Editorial.]

The business men of Chicago are loud in their faultfinding on the score of inaccuracy and delay in the telegraphic messages they send and receive. Particularly is this true of what is known as the Board of Trade branch of the service. It is said a perfect flood of letters of complaint pours into the Western Union office in this city every day, the number being so great that to properly investigate, rectify and explain would require the exclusive time of three or four employes. The company not being disposed to go to this expense, of course the great bulk of the complaints remain uninvestigated and unanswered.

Not a day or a night passes in the *Tribune's* telegraph room that does not bring from twenty to five times twenty samples of the grossest inaccuracy, inefficiency and incompetency on the part of the working force of the Western Union Telegraph Company. Dispatches, both special and Associated Press, are so brutally botched, either in the sending or receiving, or both, that it is in frequent instances utterly impossible to put them into intelligible shape, and the matter, be its character of the utmost importance, is perforce thrown into the waste basket.

In general the quality of the service rendered by the Western Union has undergone a marked deterioration within the past three months. The cause is not difficult to arrive at. The removal of all competition seems to have carried with it the removal of any necessity for first-class service, for almost from the very day of the consolidation the service began to grow poorer. We are informed that one of the first steps taken by the new management of the Western Union monopoly was a reduction in the wages of operators, the effect of which was to drive the best men from the company's employ, and to fill their places with ignorant and incompetent operators. It is the old story over again of monopoly, greed and indifference to the public interest. If the public complains there is no remedy; it must take poor service or none at all, and the only consolation to be found in the situation is in the certainty that this state of things cannot continue forever, and the probability that the public will not much longer remain helpless for lack of competition in the business of telegraphy.

#### An English Scientific Journal's Compliments to the "Journal of the Telegraph."

[From the Mechanical World of Aug. 27.]

Can any of our American subscribers or contemporaries tell us who is Prof. Maurice Keil, M.A., C.E.? More especially we desire to know of what science he professes to be a professor, and what college is so degraded as to acknowledge his teaching. More especially also we appeal to the *New York Journal of the Telegraph*, in its own interest, to furnish us with the information we seek to obtain. This journal, up to very recent times, occupied a reputable position, and we therefore regret to see that it has, in its issue for the 1st of August last, allowed itself to become the instrument of a most gross and glaring fraud.

In the month of May last we wrote an article on "The Future of Electricity," which was printed on pages 421 and 422 of our issue for the 28th of that month. This article has since then been wholly or partly reproduced in many directions, and has attracted a considerable amount of attention. In the majority of instances the reproducers have acknowledged the source from whence they derived it, and we have not hitherto complained of those who have not. We are fully aware of the difficulty of acknowledging an article to its parent, and are prepared to overlook an occasional omission of this character. The instance to which we will now allude, however, can have no excuse whatever, for it is one of the most flagrant acts of appropriation which has ever come to our knowledge.

In the issue of the 1st of August of the *New York Journal of the Telegraph*, in the most prominent position the editor could accord to it, occupying as it does the whole of the front page, appears an article headed,

#### THE FUTURE OF ELECTRICITY.

BY PROF. MAURICE KEIL, M. A., C. E.

This article, except in one paragraph, is word for word and sentence by sentence the same as the one written and printed by us on the 28th of May, and already referred to. This Autolycus has not thought it germane to the subject to reprint the end of our article, as it somewhat pointedly refers to people who are nearly as dishonest and unscrupulous as himself.

We invite the *Journal of the Telegraph* to afford us public satisfaction for so palpable a wrong, and the "professor" to do public penance for his piracy. Considering that the *Journal of the Telegraph* claims to be the official organ of the Western Union Telegraph Company of the United States, we cannot but, meanwhile, express our great surprise at the singular method of editing lately adopted by the conductors of that periodical. We are all the more anxious to know what explanation the *Journal of the Telegraph* has to offer, for the reason that in its previous issue another of our original articles was bodily "lifted" without acknowledgment.

Professor Cohn, of Breslau, is quoted as favoring the introduction of electric illumination, on optical grounds. While testing the influence of this kind of light on visual perception and the sense of color, Dr. Cohn proved, he thinks, that letters, spots and colors were perceived at a much greater distance under electric illumination than by gaslight, or even daylight; compared with the latter, it increased the sensation of yellow sixty-fold, red six-fold, and green and blue about two-fold. Again, eyes that in daylight or gaslight could perceive and distinguish colors only with difficulty, were much aided, he says, by the electric light, and the visual perception was much strengthened.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, SEPTEMBER 15, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### PROGRESS OF THE TELEPHONE.

Were it not for occasional meetings of the telephone people, which always attract widespread attention throughout the country, few people would pause long enough in their daily life to think of the wide extension of the telephone in the past few years, and the number of persons employed in operating it. "The National Telephone Exchange Association" was formed as recently as September of last year, its first meeting being held at Niagara Falls. Its second meeting was held at Chicago April 5 and 6 of this year, and yet at their first anniversary meeting last week, at Saratoga, the delegates present represented 180 different telephone companies in the United States, covering all the principal cities, while the capital represented was almost unlimited.

Their last meeting, a full account of which will be found in another column, shows that America is not only the home of the telephone, but that she also leads the world in its application, both in its science and the high standing of those employed in the business.

We cannot overestimate the value of the telephone, nor the latent possibilities involved in its increased use and a careful study of it. In one particular alone it has, in employing the cleverest electricians and most thorough-going business men, given a wholesome lesson to its older cousins—the telegraph companies. While the latter have been driving their best men away by despotic measures, the telephone people have been absorbing them into their system; consequently, while the telegraph companies have been nearly forty years in reaching what they call full growth—but which, in fact, is not half full growth—the telephone companies have done the same in less than four years. The lesson of this is, and it is one which the telegraph people might well take to heart, that increased facilities for telegraphing, even where they are apparently not needed, *make business*. Business facilities make business, and no one has recognized this fact more thoroughly than your representative telephone man. A., a smart business man, uses the telephone to B., an old fogey, and makes it necessary for B. to wake up and reply by telephone, and between them C. and D. are forced to adopt it.

Thus, while the telephone is a great institution in itself, and for itself, it is also doing good service for the telegraph, by teaching its managers just what ability, courage and celerity in handling the business of the public may do.

Now that the *Journal of the Telegraph* has been given a lesson in editing, it might not be out of place for us, its junior by seven years, to deliver it a lecture on the subject of the proper functions of a telegraphic paper. Whether such a journal attempts to be purely scientific or only gossipy, or even a judicious admixture of both, it must first of all be reliable, and it would also be as well to be newsy occasionally. During the great war between the Western Union and the American Union, the coolness and persistence with which the *Journal* ignored Gen. Eckert, Mr. Bates and the entire American Union Company was the source of much wonder to our thinking men. So far as that journal was concerned, its readers rarely, if ever, heard of the American Union. It would be much better, in cases of that kind, to face the music, pointing out where the opposition were acting unfairly, defending its own people and explaining their policy. THE OPERATOR, for instance, is an example of success in this direction, since it is taken and read by all parties. It covers everything, aims to be just to all, and is very generally reliable in its data—its New Year's "Review" of the year just closed being accepted as authority, and carefully preserved in thousands of scrap-books. A glance back through the files of the *Journal of the Telegraph* will show that THE OPERATOR is the only reliable record of our profession, for when the former journal has not been filled with long dreary articles, like the charge of a grand jury, it has been making the most absurd misstatements. It has, for example, in a General Order, told the operators, when sending press, to make . . . at the end of each news paragraph, when, in fact, they were to make — — —. It has gravely told us of an operator who could receive by sound and write down a message with his left hand while he was at the same time sending a different message with his right hand. It has (Dec. 1, 1879) jauntily informed its readers that a telephone circuit was worked from a point in Nebraska to Sayre, Penna., a distance of 2,000 miles, when in fact it had been worked only  $\frac{3}{4}$  of a mile—a trifling error of 1,999 $\frac{1}{4}$  miles, which it corrected in an off-hand way a month afterward. Then, only last May, in reviewing a treatise written by "J. E. H. Gordon, B. A. Camb."—which THE OPERATOR promptly informed it means Bachelor of Arts, Cambridge (England) University—it announced with glorious nonchalance that the treatise was written by "J. E. H. Gordon and B. A. Camb"—two men. This is a kind of "editing"—shoveling the matter in—which is grossly misleading and highly offensive to good taste.

THERE is a good deal of dignity and quiet disdain in the lecture which the *Mechanical World* administers to the Western Union Company for trying to illustrate the fact that in its endeavors to maintain an official organ dirt-cheap the scissors are mightier than the pen. The *Mechanical World* is severe. There is honest indignation in its complaint that in the *Journal of the Telegraph*, for Aug. 1, there appears an article "word for word, and sentence by sentence, the same as one written and printed by us (the *Mechanical World*), on the 28th of May." Then we have some mild reproof in the sentence: "Considering that the *Journal of the Telegraph* claims to be the official organ of the Western Union Telegraph Company of the United States, we cannot but meanwhile express our great surprise at the singular method of editing lately adopted by the conductors of that periodical." Then it strikes a mournful strain, and sighs, "This

journal—that is, the *Journal of the Telegraph*—up to very recent times occupied a reputable position." Then coming back to the main point, the *Mechanical World* gets angry again, and talks of another of its articles which was "bodily lifted" by the *Journal of the Telegraph*. In view of the company's enterprise in branching out from a system of guerilla warfare on the time and money of its operators into literary piracy, "lifted" is an appropriate term. But it is in the matter of calling names where the *Mechanical World* comes down like a trip-hammer. "This Autolytus—that is, the *Journal of the Telegraph* again—will set its editorial staff reading Shakespeare, where, in 'A Winter's Tale,' they may reflect upon the devious ways of the original 'snapper-up of unconsidered trifles.'" It would appear that the *Mechanical World* has completely flattened out the *Journal of the Telegraph*, but the end is not yet here, since our hypercritical contemporary, the *Electrician*, which delights to pick flaws in the grammar of American journals, should take its English neighbor in hand for the use of the tautological phrase "from whence."

THE Pennsylvania Railroad, which pays its operators twenty-nine dollars per month, is rapidly losing the confidence of the public, through fatal errors made by its overworked and underpaid telegraphers. Since our last issue they had a collision, near Philadelphia, owing to an operator's mistake, in which General Manager Frank Thomson's private car was smashed into kindling wood, many passengers were more or less hurt, and the lives of a great many were in imminent peril. It is only a few months since the same railroad, through an error of one of its operators, wrecked an express train at Bear Swamp, near Trenton, N. J., sacrificed thereby two human lives and severely wounded many people. The same thing must happen again, and the public should know it, for it is absurd for a corporation, even one as mean as the Pennsylvania Railroad, to secure reliable telegraph operators, for the despicable "salary" offered by them. Passengers are at the mercy of these operators who work the block signals, and any company which will offer twenty-nine dollars per month for all the training, all the sleeplessness, all the fidelity necessary on an operator's part to maintain the system, is simply trifling with the lives and limbs of its patrons.

THE gathering of Pioneer Telegraphers at Niagara Falls, on the 20th inst., should bring together a great number of the veterans of the service, and, if they once get together, we bespeak for them a good time. When the guests assemble at the place of meeting they will register their names, time and place of entering the service, and the first position held and the one at present occupied, and, before adjournment, the photographs of all are to be taken singly and in a group; though if they "take" nothing but photographs we believe that it will be scarcely satisfactory to such a crowd of good fellows, and that a few may take something on their own account. Not only those at present engaged in telegraphic service will participate, but there will be many scattered veterans present who have long since forgotten their original avocation for other callings. Some of those who were at the gathering last year at Cincinnati have passed away since then, but they should not be forgotten, and, in honoring those dead ones; let us not forget the memory of that cultured telegrapher and most amiable gentleman—the late James Nye Ashley.

THE raking-over which a great portion of the public press is giving to the Western Union Company is having its effect in better service all around, and in extracting from the company a show of greater public spirit. This is encouraging, and we hope the improvement will continue. The management was caught slightly napping upon the first rush from Long Branch, consequent upon the removal of the President, but somebody finally opened up the company's "bar'l," and money enough was then spent to pay for securing proper facilities. It's like drawing teeth, but they are learning quickly, and it rather looks now as though the economists must go. If they have to spend a little extra money upon these occasions, there is no use in the managers running the flag down to half mast and wearing crape on their hats; it will all float back to them again in increased business.

WESTERN UNION stock is quoted at \$92 $\frac{1}{4}$ . Last issue it was \$88 $\frac{5}{8}$ . The price rose somewhat on reports of extraordinary earnings and some rather vague expectations that the next quarterly dividend would be marked up to two per cent. As a matter of fact the Executive Committee met Tuesday the 13th, and recommended to the Board, which met yesterday, the propriety of declaring a dividend of 1 $\frac{1}{2}$  per cent. As to the report of the company's extraordinary earnings there appear to be two sides. The *Herald* says that the statement will show that after deducting the coming dividend there will remain a surplus of about \$400,000. Of this amount about \$150,000 was carried over from the last quarter, the remaining \$250,000 being the ostensible increase of earnings during the past three months. Parties who, to a great extent, are "a power behind the throne," likely to know what they speak of and pledge themselves as to the veracity of their statements, aver that the above surplus has not been acquired from the legitimate earnings of the company's business. During the last six months, say they, the Western Union Company has sold securities, consisting of Gold and Stock Telegraph Company stock, Cuban Cable Company stock and other assets to the amount in cash of about \$1,025,000, which sum, they further aver, has been added to the current earnings. If this statement be true, there would result a deficiency of some \$775,000 in nine months' business after deducting three dividends of 1 $\frac{1}{2}$  per cent, or in other words the company's net earnings for the nine months will not exceed 3 $\frac{1}{2}$  per cent.

MOUNT WASHINGTON was treated recently to an electrical surprise party. Three bolts of lightning struck its summit, or its near neighborhood, in rapid succession. The signal station and Summit House were hit at the same time, though they are 20 or 30 rods apart, and some damage was done, while several persons had narrow escapes. According to a writer in *Harper's Monthly Magazine*, the "goings on" at the signal station on the top of Mt. Washington are something terrific. One night the wind rose from 100 to 150 miles an hour. Although the stove was red-hot, water froze within three feet of it. The loose ice was dashed against the house in a roar. There came a crash. In spite of an iron bar and several strong wooden buttons, the oaken inside shutters were blown in, and it was all two men could do to force them back into their place. A cleat had to be nailed to the floor and a heavy plank placed between it and the shutters in order to keep them in place. At 4 o'clock A. M. the wind had risen to the velocity of 136 miles an

hour, and they momentarily expected the building would go tumbling down the mountain. But, after that, the wind decreased, and at 9 o'clock it was only 10 miles. "Suppose the house had gone, and the hotel stood fast, could you have effected an entrance into the hotel?" asked the reporter. "We could not have faced the gale," said the signal service man. "Not for a hundred feet? Not in a matter of life and death?" "Impossible. The wind would have lifted us from our feet like bags of wool. We would have been dashed against the rocks, and smashed like egg-shells," was the reply.

FOR some weeks past the officers of the Bankers' and Merchants' Telegraph Company say their poles in the State of New Jersey have been cut down during the night, and they were finally compelled to call upon the authorities to stop the nuisance. At 5 o'clock on the morning of Sept. 6, a Newark constable arrested a man named John Davis, who, the complainants say, is one of the line men employed by the Western Union Company, in the act of cutting down poles in the neighborhood of Franklin, N. J. He was brought before Justice Rodrigo, in Newark, and held in \$2,000 bail on three charges. The first charge was for malicious mischief, the second for conspiracy and the third is made under a special New Jersey statute enacted for the purpose of preventing the cutting down of poles. It was asserted in the office of the Bankers' and Merchants' Telegraph Company the next day that Davis had been bailed out by J. B. Feary, manager of the Western Union's Newark office. When arrested Davis stated that he had been directed to cut the poles down by H. McAleer, a superintendent of construction of the Western Union. McAleer has also been arrested and held in \$2,000 bail.

It always does us good to note the success of an operator, so that we are gratified to read in the English papers that Andrew Carnegie—some years ago messenger boy at Pittsburgh, and later operator at Altoona, Pa., but now a millionaire iron master—is creating something of a sensation in England. He is accompanied by a party of friends from America, and has been making a tour of Great Britain with his own four-in-hand. Starting from Brighton, in England, he finished at Inverness, in Scotland. At his native town, Dunfermline, to which he has been a munificent benefactor, he was received by 8,000 persons, the Provost at their head, and Mr. Carnegie's mother laid the first stone of a public library to be erected by her son at a cost of \$40,000. He had already built swimming baths at a cost of \$25,000.

OUR esteemed British contemporary, the *Mechanical World*, wants badly to know who is "Professor Maurice Keil, M. A., C. E."—the person who, with the aid of a pair of scissors, a paste-pot and an old copy of the *Mechanical World*, "wrote" such stunning articles for the *Journal of the Telegraph*. We don't believe that the Professor is an American, since in that case he would have been "General" Keil, or a Colonel at the very least, and we think that our English contemporary may make up its mind to the fact that Professor Maurice Keil, M. A., C. E., belongs to that mythical order of beings so well represented by Tom Collins, Mrs. Harris, that One Man in Charleston, Giovanni Purissimo Morosini and other preposterous or grossly improbable persons.

THERE are now half a million miles of telegraphic wires in the United States; Great Britain uses 114,000 miles of line; Germany has 150,000 miles and more than 3,000 miles of underground cable; British India has 50,000 miles; France, 115,000; Belgium, 15,000; Spain, 25,000; Denmark, 65,000, and Norway, 10,000 miles, which are used chiefly in the management of her fisheries. The Emperor of China has allowed 1,270 miles to be built during the past year. Persia has 6,000 miles and Egypt 9,000. Russia has 130,000 miles in use. Australia has 15,000 and New Zealand 10,000. South America, with the exception of a trans-continental line from Valparaiso to Buenos Ayres, and a short line between Aspinwall and Panama, has no land lines.

IN the British House of Commons, Mr. G. Stewart MacIver has given notice of the following motion: "To move, early next session, for a select committee to inquire into the working and management of the Postal and Telegraph services, with a view to ascertain whether increased facilities and lower rates cannot be afforded; and also to consider and report on the relationship of the letter-carrying and telegraph services to each other, and the best means of securing efficiency in both branches, having regard to their constantly-increasing importance in their bearing on social and commercial life." The newspapers of this country seem to be giving notice to the Western Union Company to do something of a similar character.

STRANGE how many hotel and steamboat clerks there are by the name of Gillespie. In telegrams addressed to them these gentlemen's names are generally parted in the middle thus, "Mr. Gilles, pie clerk, etc." A San Francisco correspondent reports a case of this kind out there; an ex-operator in St. Paul, Minn., has just been telling a newspaper reporter of another instance of the same nature in his experience, and a correspondent at the South draws attention to a similar barbarism on the part of a receiving operator there. The moral seems to be that the Messrs. Gillespie should choose some other avocation and thus not put temptation in operators' way.

THE OPERATOR is always pleased to point with pride to an old-time telegrapher who has risen, by industry, perseverance and the exercise of more than ordinary business ability, to a high and honorable position in life. None whose portraits we have yet published deserved the compliment more than the gentleman whose picture will be found on our first page to-day. Mr. Vail has accomplished in a few years more than it falls to the lot of most men to compass in a lifetime.

A WESTERN UNION manager in an adjacent city has been compelled by circumstances to add five dollars to the salary of several of his \$50 men. At last accounts he was not convalescent, but was doing as well as could be expected. Pulse 194, temperature 103.9, respiration 8.

IN reply to a correspondent we would say that Mr. J. H. Emerick, 120 Broadway, New York, is Superintendent of the Mutual Union Telegraph Co.'s lines between Boston and Washington.

"THE Lord's Day Observance Society" is dissatisfied with the Paris Electrical Exhibition, because it is kept open on Sundays.

DON'T forget the Old-Timers' convention next Tuesday

## Notes and Queries on Electricity and Electromagnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 151. What sizes and qualities of wire are suitable for telephone lines?

A. Any kind of wire that is suitable for telegraph lines is in the abstract equally suitable for telephone lines, both as a matter of economy in first cost and for ease in manipulation; it has, however, been found expedient, ordinarily, not to use a larger wire than No. 12, galvanized iron. For long lines, such as those between cities, Nos. 9 and 8 are generally used.

A much smaller wire of steel can, however, be profitably used on short lines, for the following reasons: A small steel wire is as strong as a much larger iron wire. It is, therefore, very easy to handle while it is being strung, and this is quite a consideration. It is also a comparatively easy matter to obtain permission to erect a fixture on a roof where very light wires are employed, and by using small wires induction is much diminished.

On the other hand, the resistance of the conductor is greatly increased, both because that conductor is steel, and because a small wire is used. Insulation is thereby rendered proportionately difficult. These considerations cannot, however, outweigh the previous ones, because on such short lines as those we are speaking of—for example, from half a mile to a mile long—the resistance, at the greatest, is not so much as to render the line at all difficult of insulation; and, in the second place, no sensible difference is perceived in using a telephone, even where the resistance is considerably increased. Furthermore, so far as signaling is concerned, the tendency is decidedly to use magneto electricity for signaling, and these currents can never have any difficulty in doing a reasonable amount of work or in ringing a bell loudly over more miles of steel wire than can be expected within the limits of any American city.

Copper wire has been spoken of; and is used to some extent, but its high intrinsic value and the number of supports rendered necessary by its use will necessarily act against its general introduction.

Q. 152. What amount of stretching should good iron wire bear without breaking?

A. In different countries different standards are given. For example, on the government telegraphs in England line wire is required to be able to elongate 18 per cent. before breaking. The Western Union Telegraph Company specifies that line wire must be capable of a 15 per cent. elongation. It is safe to say that any wire for telegraphic purposes should at least be capable of stretching to the latter percentage. The breaking strain should be not less than two and a half times the weight of the wire per mile, that is, if a mile of wire weighs 200 pounds, and a piece of it is undergoing a test for strength by suspending weights from it, the wire should not break until the amount of weight reaches 500 pounds.

Q. 153. What is to be understood when the "dip" of a line wire is spoken of?

A. The dip of any telegraph line wire is the sag between the poles; that is, when a wire is strung, it is never pulled up tight between the poles, because if it were so strung, it would break very easily from any cause. Consequently, between the poles the wire dips, or sags down in a wide curve, which is deepest at the middle of the distance from pole to pole.

Q. 154. How is the tension or degree of tightness with which wires are strung, regulated? And is there any dip which is regarded as a standard?

A. In America there has been very little regular practice of this kind, and the only rule has been for every line foreman to do that which was right in his own eyes; and, in view of such a fact, the small amount of trouble that our lines give on the average is astonishing. It is, however, an obvious fact that line wires must be strung sufficiently tight to prevent crosses, and sufficiently slack to avoid breakage from slight causes, or from any ordinary change in the temperature of the air. It has been ascertained by the British telegraph engineers that this happy medium is attained when the dip, with

a temperature of 60 degrees Fahrenheit, is twenty-four inches in a span of one hundred yards. This dip may then be approximately taken as a standard.

## Chicago Notes.

To The Editor of The Operator:

SIR: The Chicago Tribune of to-day takes the Western Union very severely and pointedly to task, on account of its miserable service hereabout. Your correspondent thinks that if the local managers here be not hampered by a policy of retrenchment, emanating from higher authorities, there is room for suspecting that it would be well if they would endeavor to infuse a little more life and nerve into their several departments, by a wiser liberality in rewarding talent, a more industrious attention to the weeding out of the dull and inefficient, and a general rearrangement and brightening up of the system under their control.

The present state of affairs may be summed up in a few words. The W. U. Company is doing an unprecedented amount of business—fortune and misfortune, happiness and distress, all contributing alike to swell the great aggregation of messages to be daily handled (as also of cash to be counted). In many directions facilities, in the way of wires, have not nearly kept pace with the probably unexpected public requirements. The reliable and experienced operators called to this office have been overtaxed in their labors, and not sufficiently recognized and encouraged by salaries that would make it an object, or at all desirable, for them—in view of their prospects of health, and the arduous duties imposed—to long remain in such positions.

Chicago is one of the most important telegraph offices in the world, and it is enlarging at an astonishing rate. Its local business is probably as great or greater comparatively than any other city of the land, and its business to be repeated to and from the great West, North and Southwest is not less important and vast, and should all be handled by the most sober, reliable and experienced men to be obtained. Scores of such men have tarried here from time to time, within the last few months, but, tiring of incessant and enervating labor, remunerated not more liberally than many of the incapable and shirkful, and burdened with increasing necessary and incidental expenses, they have soon retired to quieter shades and more comfortable livings; either to the larger railroad offices, as superintendents' clerks to interior towns, to distant frontier posts, or to other callings and pursuits, and there are many more here who contemplate a speedy and like change. All such men could be retained at an considerable advance in salaries and a fair imposition of duties. The whole basis and system of salaries and promotions is now, your correspondent believes, unfair and discouraging. It affords no incentives to the careless and inexperienced—leading them to ambitious efforts and aspirations—nor fixes any restraint upon the habitually intemperate delinquents and absentees, who, instead of constantly sharing in the work of the office, are, as regularly as they possess a few dollars, deserting their posts, and leaving increased burdens to the more faithfully disposed. The almost infallible artist of proved reliability and ten to twenty-five years' experience, receives no more salary than he of innumerable shortcomings and five years or less in the service (and there have been known cases where the salaries of individuals of the latter class, in official favor, or by official oversight, have been the highest). Such has been the rule since the earliest remembrance of the oldest "knights of the key." Will any one pretend that the service of the Western Union is of as high a standard of efficiency as it would have reached had there been ruled some distinguishments in the orders of merit and salaries? Will any one imagine that the company has gained any more of wealth and strength by such indifferent attention to the relative talents and abilities of its employes, or that the great public in consequence is now being so well served as it should be?

Your correspondent will take the liberty, before closing, of adding another item of particular and agitating interest to the operators of Chicago. Soon after the famous consolidation an order was posted here requiring Sunday work without extra compensation. The day of rest

and of God is not now recognized to the favor of any, no matter how deeply his or her soul may be impressed with the holy and cherished teachings of a lifetime. The ladies, even, whose religion is the best part of their existence, after a wearying week of toil cannot enjoy the Sunday rest accorded all civilized beings without losing a distressful portion of their daily bread. Will heaven prosper even the possessors of a hundred millions in such cold, ungrateful and mercenary consideration of the means and power by which the acquirement of those hundred millions was made possible?

It will be charitable to suppose that the authors of the above order have not given its meaning serious thought; and it will be fair to think that the order did not emanate from those who must, perforce of their vital interests, have the welfare of the company most at heart; and, finally, it will not be unreasonable to predict that, when all questionable irregularities are properly brought to the attention of "the powers that be," a glorious future, full of glittering promises, will not be condemned for the sake of little present advantages.

BON SOIR.

CHICAGO, Sept. 11, 1881.

## Sunday Work at Chicago.

To the Editor of The Operator:

SIR: About six weeks ago a petition was presented to the management, signed by at least 75 operators on the day staff of this office, asking that extra compensation be allowed for Sunday service.

As no acknowledgment has been received up to the present time of writing, we are ignorant as to its disposition.

This compulsory Sunday work is beginning to assume a serious aspect, and a wide-spread feeling of dissatisfaction is engendered thereby. No one of the officials here likes to shoulder the responsibility, consequently we know not whom to go to for redress. The company is making nothing by this short-sighted "economy." More complaints are filed respecting the Sunday business that passes through this office than regarding that of any other day in the week. The Sunday operator reasons in this wise, and quite logically and naturally, too: When I engaged myself to this company five years ago, Sunday work was not stipulated. Now I am compelled to give eight hours every month without receiving extra compensation for my services. If I am a quarter of a day late during the month it is deducted from my salary. This I do not object to, because I expect nothing that I do not work for; but as I am doing this for nothing, they are welcome to all they can drag out of me while here. I will work faithfully during the week,—but, hang me, if I will do it Sunday, if not paid for it.

We would have been more contented with a five per cent. reduction than with this deal, because it would have, at least, seemed a little more fair and honorable.

Good men are scarce to-day. What will it be when the Mutual Union gets fairly under way?

Col. J. J. S. Wilson, who has always proven himself to be a good friend of the operators, will find no difficulty whatever in securing the very best talent Chicago now boasts of.

In nearly all the larger offices men have to work Sunday. Where they do not get extra compensation there is generally something to offset it. Take New York, for instance. If I am correctly informed, the day force only work nine hours, and about every seventh Sunday, and then they do not work as long as we do.

It won't do for head-quarters officials to plead ignorance as to the existing state of affairs in this office any longer. This is the third time it has been brought under their notice during the past three months. All we ask is that this Sunday work be relegated back to the place it occupied before the consolidation.

A DISSATISFIED ONE.

## Is the Telephone Operator Properly Fed?

The following from the New York Evening Express would seem to contain many points of vital importance to the above class of intellectual workers:

"The existence and efficacy of nerve food has been established as a scientific fact. That the waste of mental energies and the exhaustion of

intellectual power may be in some measure compensated for by the use of certain forms of food in certain conditions is no longer denied by the best medical authorities. Critical examination of the human brain shows its component parts to be of a character susceptible of reconstruction, the more rapid and effectual in proportion to the nature and ingredients of the food consumed from which its sustenance is drawn. In the Blanchard Prepared Foods we find this general principle utilized (a further description of which will be found in our advertising columns), and for which is claimed unusual merit as a restorer of enervated vital forces and diminished mental vigor. This mental tonic is a concrete extract of wheat and beef (artificially digested, that it may not tax the vital energy in the process of assimilation), and, while free from merely stimulating mixtures, feeds and vitalizes the blood, the brain and the subsidiary nervous ganglia in such manner as to be of great service to those whose intellectual resources are constantly taxed in the performance of the more arduous mental duties which fall to the lot of the world's great teachers and masters. The argument above is based upon the undisputed physiological fact that the gray cell of the nervous tissue, which is the active material organ of the intellect, has only one natural want, that of sufficient proper food, and aside from all scientific theories and deductions, the position seems to have a natural basis in common sense, which indicates that strength and vigor, physical and mental, reside primarily in the great natural means—food. In fact, there can be no other basis. The success attending the application of these celebrated foods shows conclusively the value and soundness of the theory promulgated. Thousands of eminent physicians are daily prescribing them.

Further information concerning these valuable foods can be had by addressing any of the principal offices of the Blanchard Manufacturing Co., proprietors:

No. 8 Tremont street, Boston, Mass.

No. 149 Canal street, New Orleans, La.  
No. 27 Union square, New York City.

## TELEPHONE DEPARTMENT.

The Telephone Exchange in Rome, Italy, has more than one hundred subscribers. The Société Générale Italienne des Téléphones has established exchanges in other large towns.

Telephonic communication between Newburgh, N. Y., and Fishkill, a distance of seventeen miles, was opened on the 1st inst. The cables are in perfect order. Connection is now had also with New Hamburg.

It has been suggested that the nearly forgotten phonograph be used as an adjunct to the telephone; that is, to make the phonograph record permanently what the telephone articulates, thus definitely fixing the responsibility for all errors in the transmission of messages.

At the Paris Electrical Exhibition the telephone rooms are lined with Oriental carpets, overhead and under foot, as well as all round, to exclude from them all sound from without. On the occasion of President Grévy's recent visit, the members of the Presidential party were placed in communication with telephones and told to listen. They put their ears to the apertures and were very attentive. At the Opera-house a chorus was engaged in singing the hunters' song of "Der Freischütz." This was heard with fair distinctness in some passages. In "La Prière de la Muette" the parts got confused, and where there should have been musical effects there was a buzzing as of Brobdignagian bees.

The Uniontown (Pa.), *Standard* says: "We saw an old lady clad in Quaker garb, and wearing the time-honored 'shaker,' on our streets

the other day. Said a gentleman to us: 'There goes Elisha Gray's mother; she's the jolliest, cheeriest old lady you ever saw.' And so it was; a face she wears that seems the index of a heart overflowing with the 'milk of human kindness.' And this old lady in sober drab is the mother of Elisha Gray, the inventor of the telephone—the celebrated electrician. She has returned to visit the friends of her earlier years. Here her boy worked as a simple mechanic in Wood & Crowlow's planing-mill, and even then was nurturing those dreams which have had such a brilliant realization."

A dispatch from North Adams, Mass., on the 7th inst., says: "The New York & Vermont Telegraph and Telephone Company is to run its wires from Troy, N. Y., to all towns and villages on the line of the Troy & Boston Railroad to North Adams, connecting with the Bennington (Vt.) Telephone Company. The latter stock is controlled by Richard G. Bennett, of Troy, and George W. G. Ine, of Valley Falls, N. Y., who, with Ensign S. Randall and Charles A. Nims, of Troy, who control the former company, will push the new enterprise through from here. The line will connect with the Commercial Company, and will open communication with Albany and Troy, thus covering a circular area of 125 miles. This will be the longest telephone line in this section of the country. Work is to begin immediately."

A considerate editor, with a good deal of human nature in him, thus speaks a word for the hard-working 'phone operator: "It is natural for man to indulge in the illusions of hope and to swear at the attendant on the telephone call board. Almost every day some one comes in and tells us to 'cuss' the Central office, or he will stop his paper. Now we propose to give the Central a fair show, and do some of the 'cussing' on the other side. More than half the time the one at the other end is to blame, and if they only had the patience to wait a moment until the operator connected some one else who rang first, all would go well. It is wonderful why a man whose patience can stand every other test, will lose his temper at the telephone. Imagine yourself in the place of the dulcet toned damsel who presides up there, and 325 subscribers yelling and scolding and grumbling, because everything don't work like lightning. How would you like it to stand there and have such expressions as the following fired at you: 'Hello! HELLO! HELLO?' and then change and swing on order of syllables and inflection. 'Are you asleep?' 'I've been calling two hours.' 'What in — is the matter up there? If you can't make this d— thing work you can take it out.' Well, there's two sides to every shield, and when you read this, reflect before you abuse the 'Central.'"

## DASHES HERE AND THERE.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.

THE Cotton Exhibition which opens at Atlanta, Georgia, on the 1st prox., should make the telegraphic business quite lively in that section of the country.

Communication by the French Cable Company's cable, between Land's End, England, and Brest, which had been interrupted for about two months, was restored Sept. 4.

The destructive effects of the use of gas near the pictures of Baudry in the new Opera House, Paris, have become so obvious that the authorities decide to illuminate that part of the theatre by electricity.

A cable dispatch from London says that Anglo-American Cable Company's shares rose  $\frac{3}{4}$  of 1 per cent. Sept. 11 on rumors of negotiations of Mr. Gould, who, it is stated, asks 25 per cent. of the gross receipts as the proportion for his two cables.

OFFICE OF THE BLANCHARD MFG CO.,  
27 Union Square, New York.

The third quarterly dividend for the year 1881, of three per cent., is payable Sept. 21, 1881. Transfer books closed Sept. 11.

H. P. Sisson, Secretary.

According to reports attributed to the officers of the Western Union Telegraph Company, where dynamic generators have been substituted for decomposition batteries for the generation of the

current, the cost of charging the wires with the dynamic current is about one-half of what it was under the old system.

Mr. A. B. Smith advertises the Barron Flexible Key-Knob in the present issue. These key-knobs had a very extensive sale among telegraphers when advertised before, a short time ago, and the universal indorsements they received were of the most unmistakable character. There is no reason why they should not have an equally large sale now. Every one troubled with telegraphers' paralysis should give them a trial.

Telegraphic blundering and rash emendation brought about a scare at Accrington in England recently. A dispatch was received at the Mechanics' Institute, saying the Earl of Edinburgh was dead. As no such title was known, somebody in charge altered "earl" to "duke," and the news spread far and wide that Her Majesty had lost her second son. The death intended to be announced was that of the Earl of Gainsborough.

The *Electrician* says: The Carmarthen County justices have just committed an Irishman named Hurley to one month's hard labor for snatching up from a table in an inn, chewing and swallowing a telegraphic message, with a shilling wrapped up in it, that was intended for transmission elsewhere than down his, apparently, capacious maw. One month's hard labor will no doubt do much towards aiding digestion of the toothsome morsel.

The Central District Telegraph Company's messengers at Pittsburgh, Pa., struck on the 9th inst., about 6 o'clock, without informing the company of their intentions. The boys have hitherto been receiving from \$12 to \$18 per month, according to their experience, and now demand an increase to \$18 for all messengers on night or Sunday. The strike caused much inconvenience for a few hours until a sufficient force could be obtained to handle the business.

The amplifying telephones advertised by Messrs. Holcombe & Co. give excellent satisfaction as the following will show:

FREDERICK, Md., July 27, 1881.

GENTLEMEN: We received the telephone safely and erected it to-day, and we are delighted with it. A gentleman who has a Bell telephone just examined it and was very much pleased with it. It works admirably. We can distinctly hear a watch tick over it.

Respectfully,  
C. R. HARDT & W. E. HOWE.

KEY PORT, N. J., July 28, 1881.

GENTLEMEN: The telephones came duly to hand; they are now in good working order on a line of 1,800 feet with six angles. Messages came satisfactorily on first trial. Yours truly,  
W. HODGSON.

## NEW YORK CITY ITEMS.

Echoes From 195.

195 Broadway is reorganized about once in every three months.

Mr. George Warren has returned from Denver and again buckled on the telegraphic armor.

The original message read: "President not expected to live. Market all down." But as delivered it ran: "President reported to live; not dangerous at all."

"What kind of a man is Lenhart?" inquired a Jersey operator the other day.

"Lenhart?" replied the N. Y. man. "He generally summers at the Fifth Avenue Hotel, and there is on him the unbroken seal of one

'Solemnly elected

With gifts and graces eminently adorned  
To some great work."

Mr. A. S. Downer, manager of the Western Union main office, this city, has resigned, much to the regret of the employés there. The resignation takes effect to-day, Sept. 15. Supt. Merrihew will look after the office for the present. Who Mr. Downer's successor is to be is not yet known.

Marine Chief Weller has been taken off the Long Branch quadruplex, and is now acting as receiving operator on the Washington motor. While on the marine wires Mr. Weller won golden opinions as an independent and forcible talker, and a telegrapher of unusual merit and attractiveness of style.

As an OPERATOR commissioner tarried on the veranda of the Brighton Beach Hotel, the other evening, he overheard General Anson Stager say to a Western Union Chief: "I was always in favor of offering inducements to good operators to remain in the service." The scribe went on his way pondering, and as he groped in his pockets for a nickel to pay his fare, he wondered if telegraph operators would continue to allow themselves to become poorer and Western Union stockholders richer.

#### Other City Items.

The Mutual District Messenger Co. has now ten district offices open and ready for business.

Mr. A. E. Healy and A. A. Wyllie, of 135, leave on the 15th for a month's vacation. They spend most of the time at their homes in Canada.

*Palmer's Telegraphic Error Detector*, published by Mr. J. E. Palmer, 128 Broadway, New York, whose experience on cable and telegraph lines extends over fifteen years, is quite a novel idea of detecting errors in telegraph and cable messages. It is, without doubt, the simplest and most complete error detector published, and will be found useful to all business men using the telegraph. It not only points out the telegraphic errors, but shows how errors occur through indistinct writing. The price, postage pre-paid, is only 25c.

On the 11th inst., Thomas McDonald, a waiter, fell from the promenade roof of the Metropolitan Concert Garden, this city, and was instantly killed. The roof is inclosed by a brick wall four feet high, surmounted by a six-foot iron railing. McDonald climbed to the top of this railing to regulate an electric lamp. He carelessly or ignorantly put his hand upon the wires conveying the current, and received a shock which startled him and caused him to lose his balance. He fell into a yard in the rear of a dwelling-house in Fortieth street. McDonald, as well as the other waiters, had been forbidden to touch the lights.

A very enjoyable meeting took place at the new Mt. St. Vincent Hotel, at 148th st. and St. Nicholas ave., New York, on the evening of Aug. 31, 1881. The occasion was a dinner tendered to Mr. Ralph W. Pope, late Deputy Superintendent of the Gold and Stock Telegraph Co., by his former associates of the Gold and Stock and the Metropolitan Telephone and Telegraph companies. After discussing the good things provided for the guests by Mine Host Koch, Mr. Breslin made an eloquent address and presented Mr. Pope with a beautiful gold watch as a testimonial of esteem and regard from his former associates. Among those present were Supt. Scott, Asst. Supt. Small, Chief Inspectors Scott and Waldron, Chief Operator Sullivan and Foreman of Construction Orford, of the G. and S. Co. The Metropolitan Telephone Co. was represented by Purchasing Agent M. W. Doran. After several speeches, songs and toasts, the company broke up at a late hour.

#### PERSONAL.

Mr. C. E. Bacmeister has left Kansas City and is now in St. Louis.

Mr. C. F. Flynn, from Adrian, Mich., relieved Mr. Heine as operator at Osceola, Ind., L. S. & M. S. Railway.

R. H. Folwell is manager of W. U., Three Rivers, Mich., vice B. W. Warner, who resigned to go into more profitable business at Elkhart, Ind.

George H. Patterson, lately with the Montreal Telegraph Co., Galt, Ont., has accepted a situation as operator on the Western Division of the L. S. & M. S. Railway.

Mr. W. F. Heine, operator at Osceola, Ind., for the past two years, was promoted to the agency at Burdicks, on the Western division of L. S. & M. S. Ry., Sept. 1.

Mr. C. R. Hosmer, formerly superintendent of the Dominion Telegraph Company, of Canada, has been appointed General Manager of the new Canadian Mutual Telegraph Company.

Daniel Woodrow, operator at Bergner & Engel's brewery, Philadelphia, fell while on duty at that establishment, last week, and hurt himself badly. Tetanus set in and he died on Saturday last.

Mr. J. F. Russ, who for the last year has been in the employ of the Michigan Central R. R.,

at Michigan City, Ind., has accepted the day telegraphic position on the Pan Handle, at Kokomo, Ind.

Miss Lizzie Dawson took charge of the W. U. office at Allegan, Mich., Aug. 1, Mr. Geo. R. Stone retiring to give his attention to his other duties as postmaster and agent for the American Express Co.

A letter from England is awaiting W. H. Johnson, recently employed by the Gold and Stock Telegraph Co., in the care of Charles S. H. Small, Assistant Superintendent, Room 48, W. U. building, New York City.

L. L. Lavenberg, an ex-Michigan Central operator, and lately private operator to Superintendent of Pullman Company at Chicago, is now a popular conductor of a Pullman car, on the C. & G. T. Railway, between Chicago and Montreal.

Mr. M. R. Wolff, W. U. manager at Baltimore, Md., has resigned, and accepted a pleasanter and more important position as superintendent of the telephone lines in that city. Mr. C. R. Tracy, of the B. & O. Company, takes Mr. Wolff's place with the W. U. The latter is succeeded by Mr. Frank Warden, also of the B. & O. Company.

Mrs. Jane E. McCarty, of 17 E. Eager street, Baltimore, Md., is anxious to learn the whereabouts of her only son, John McCarty, a telegrapher, who was seen in Santa Fe, N. M., about eighteen months ago, but who has not written home for more than three years. Any one knowing his address will please communicate with Mrs. McCarty as above.

E. & Terre Haute R. R.—Following changes were made Sept. 1: C. T. Knight, agent, Fort Branch, vice J. R. Hedden, resigned; N. Bush, agent at Shelburn, vice C. T. Knight, transferred. Mr. C. J. Hepburn, train dispatcher, is from Chicago, and is a very clever gentleman. He took charge Aug. 1, when the C. & E. I. took hold of this road. The officials have introduced a new system in railroad bookkeeping and train orders, very much liked by our operators. Wages are pretty good, and men not too plenty. More changes are to be made soon, of which I will inform you. KN.

G., H. & H. R. R.—This road runs between Galveston and Houston, Texas, about 50 miles run. Mr. Jno. W. Considine, late of the K. P., Kansas City, is our genial train dispatcher, and well liked by all. W. F. Higgs holds forth at Highland. J. H. Blumenthal is agent and operator at Clear Creek. Mr. D. S. Gallagher is agent and operator at Harrisburg. At Union Depot and freight, Houston, are Mr. D. K. Marmion and Ferg. Marmion, who is always willing to lend a hand in playing croquet. Since Jay Gould has bought us out we are having new steel rails put down, and in a few weeks we will be the boss little road of Texas.

#### OLD RELIABLE.

PORTLAND, ME.—Mr. E. B. Saylor, one of the Boston quad, operators, was married to Miss Dollie L. Pettingill on the 1st inst., by the Rev. George D. Lindsay, at the residence of the bride's parents in this city. The presents were numerous and beautiful. Their tour extends over a period of a month's duration through the States and Canada. Mr. John Malone is substituting for Mr. K. W. Starbird, while Mr. Starbird takes Mr. Saylor's place on the quad, very acceptably. Mr. James Malone returned on the 1st inst. from a month's vacation; Mr. Rideout, of Boston, filling his place during that time. Mr. Rideout on leaving us started for the West. Business with us was never better.

In view of the near approach of the President's death, Manager Rheem, of the Western Union Telegraph office, has sent to Chicago for five extra operators to assist in handling the vast amount of dispatches that will be sent out from Washington during the next few days. The rush at the Omaha office will be occasioned by the heavy press report that will be received by the Omaha papers and by the report for the California press, together with special dispatches. The extra operators are expected here tomorrow. Their names are Chet. Spencer, Dave Stormont, A. G. McGill, C. F. Hutchinson and L. M. Smith, all of whom are ranked among the best operators in the country. W. E. Huey, of Chicago, is also expected here to take a permanent position in the Western Union office. Some idea of the work done in the Omaha office may be

formed from the fact that during the month of July the boys handled 182,000 messages, besides 1,000,000 words of press report.—*Omaha Republican*, Aug. 28.

At Reno, Nevada, on the 25th of August, Messrs. George Senf, of Virginia City; S. W. Chubbuck, of Gold Hill; A. M. Ardry, W. D. Mann and J. F. Farrell, of Carson; W. D. Phillips, F. H. Macdonnell and F. C. Peterson, of Reno, invaded the residence of Frank Bell, ex-Superintendent of the second division W. U. Tel. Co. On behalf of the employes of the company in this division they presented to Mr. Bell a fine silver tea set. The service consists of a full set with tray, ice pitcher and goblet, perfume stand and butter dish; in all thirteen pieces, all gold lined, illuminated with telegraphic designs and appropriately inscribed. The usual presentation speeches were made, the principal one being by Mr. Senf, and acknowledged. It was a genuine surprise to Mr. Bell, who responded in a feeling manner.

#### BORN.

PEPPER.—August 18, to Herbert M. Pepper, operator W. U. Tel. Co., Springfield, Mass., a son.

COACH.—Sept. 5, at La Cygne, Kan., to J. W. Coach, operator A., T. & S. F. R. R., a daughter.

MEYER.—To C. A. Meyer, Chief Operator A. U. office, 135 Broadway, N. Y., a daughter.

MCNEVEN.—Aug. 20, 1881, to T. H. McNeven, agent C. B. & Q. R. R., Winchester, Ill., a daughter.

#### MARRIED.

BORCHERS—CONRAD.—Sept. 2, 1881, at the residence of Rev. Jos. Hartman, Chicago, Ill., W. P. Borchers, of the A. U. Telegraph Office, to Miss Sophia Conrad, both of Chicago.

A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE.

# THE AMERICAN POPULAR DICTIONARY:

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the **AMERICAN POPULAR DICTIONARY** claims for it the support of telegraphers and the public; for the following among other reasons:  
It contains every word of the English language that enters into speech or writing.

**The Spelling** of each word is that given by the best authorities.

**The Definitions** are compiled from a majority of the best writers of the English language.

**The Pronunciation** of every word is that settled upon by the ablest scholars. In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

**TELEGRAPHERS**, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than **The American Popular**.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the **American Popular Dictionary**, and get the best Dictionary at the price published.

**The American Popular Dictionary** is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—*N. Y. Times*.

A perfect dictionary and library of reference.—*Leslie's Illus. News, N. Y.*  
We have never seen its equal, either in price, finish or contents.—*Chris. Advocate*.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

**THE OPERATOR** for fifteen months and the Dictionary, only \$2.00.

## SAM JOHNSON:

The Experience and Observations of a Railroad Telegraph Operator.

By J. ALBERT CLIPPINGER,

Author of "The Pedagogue of Widow's Guich," "Samson" Papers, etc.

176 Pages. Price, in Paper, 75c.; in Cloth, \$1.

This book consists of a series of short stories or sketches, illustrative of the checkered life and experience of a representative Railroad Telegraph Operator—a near view of the daily and nightly working of the busy bees who manipulate the two greatest agents of modern civilization—electricity and steam.

• "Sam Johnson" is one of the most entertaining books in the whole library of railroad literature. It is a series of well-told sketches and stories relating to every phase of railroad life. Some are humorous, some thrilling, some pathetic, and all interesting. The book is written by a practical railroad operator, with a ready pen and a quick eye for the salient points of a joke or incident.—*Railroader*.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75  
The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,

P. O. Box 3,332.

## THE "LATTIG" AUXILIARY LEVER NON-STICKING KEY.

PATENTED AUG. 16, 1881. PRICE \$5.00. BY MAIL.

This Key is very fine finish, nickel plated, and presents a beautiful appearance, is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the endorsement of the best operators in the country. It embodies the only true principle to prevent a key from sticking, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of sticking keys. We claim this key will never fail to make contact.

The Premium Learners' Apparatus and Outfit comprises the famous "NEW GIANT SOUNDER PERFECTED," and the "NEW CURVED KEY," placed upon a polished walnut base, with a cell of Cal-laud Battery, Chemicals, Office Wire and an excellent Book of Instruction, for \$5.00, when the money accom-panies the order.

These instruments are the exact style, size and form of the Instruments upon which we received the highest award at the Centennial Exhibition over all competitors. There is nothing whatsoever in miniature or half made up. Everything perfectly strong and reliable, and so guaranteed, or money refunded. Our Book of Instruc-tion, which accompanies the Instrument, contains full and explicit instructions as to the manner of setting up the Battery, running of wires, etc.

The Premium Instruments can be used upon a line from a few feet to ten miles in length. We have sold thousands and they have received the unqualified in-dorsement of all who have ever used them, and are pro-nounced the perfection of Learners' Instruments.

Only \$5.00.

NOT THE CHEAPEST, BUT GUARANTEED THE BEST.  
TELEGRAPH, TELEPHONE AND ELECTRICAL SUPPLIES,  
Send for our Price Lists Before Purchasing Elsewhere.

## "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY of BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

## "HENRY'S SPECIFIC"

NEVER  
FAILING  
CURE

Before Using.

FOR

After Using.

**Nervous Debility,**  
And the many evil and gloomy consequences of early  
indiscretion.

This incomparable GREAT ENGLISH REMEDY has  
already achieved a world-wide reputation for its in-  
trinsic merits; it is not a patent medicine, but a pre-  
scription of one of the most eminent English Physicians.  
It is infallible in restoring lost vigor, whether from  
imprudence, sickness, or old age. Sufferers may fully  
rely on this. We have no agents; Specific sent by  
mail, securely sealed, with full directions and rules.

Price, \$1. per pkg. or 6 pkges. for \$5.

Sufficient to cure most cases.

Address, **WHEELER & CO.,**  
205 East 14th St., New York City.

## "ELGIN" TELEPHONE FOR PRIVATE LINES

(Patented Feb. 22, 1881)

Is Acknowledged the Best in Every  
Particular by Everybody.

It is made WHOLLY OF  
METAL, Nickel-Plated and High-  
ly Polished; an ornament to any  
room or office. It is self-adjust-  
ing, requiring no BRACKET or  
even a screw to hold it in place.  
It takes the place of the cheap  
wood and parchment affairs  
everywhere. Address with  
stamp for Illustrated Descrip-  
tive Circular and Prices,

No. 12 Wire in  $\frac{1}{2}$ -mile bundles, 168 pounds per mile.  
No. 14 Wire in 1-mile bundles, 98 pounds per mile.

This Wire possesses the highest electrical conductivity, which is necessary to make Telegraph and Telephone Lines work with certainty and ease.  
Special attention given to

#### Telephone Wire,

for which No. 12 is the average size used.

### Leclanche Battery. (PATENTED.)

"Prism Battery" Complete.

—THE—

### GREAT TELEPHONE BATTERY.

The Realization of

**SIMPLICITY AND EFFICIENCY**

#### In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

#### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

#### Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**  
40 West 18th St., New York.

### A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

### DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

### Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

### Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

# DAVIS & WATTS,

BALTIMORE, MD.,

AUTHORIZED MANUFACTURERS  
TO

AMERICAN BELL  
TELEPHONE COMPANY,

Wholesale and Retail Dealers  
and Manufacturers of  
all kinds of

Electrical Apparatus and Supplies.

Correspondence solicited. We gladly furnish estimates on lines of any length, and material in any quantity.

We make our MAGNETO BELLS of unexcelled power and durability, either with frictional or tooth gearing. One of each was started in our factory in the middle of April. They have been running ever since at the rate of 240,000 armature revolutions per day of 10 hours without being touched except to oil, and are as strong as ever. Our new auto-

matic shunt is the only perfect one made; cannot possibly fail. We are always glad to send samples.

## AUXILIARY MAGNETO BELL.

This is useful for placing in kitchen, engine-room, etc., to call attention to the signals where the office is, for the time, left vacant. It is placed directly with the main line, and provided with lightning arrester and cut-out.

Owing to changing our Telephone system from Battery to Magneto, we have a lot of our handsome nickel-plated bells, which we have put on new bases, removing all telephone connection, and will clear out at much less than cost of manufacture. They are wound to 30 ohms, with best silk-covered wire. Gongs are 3½ in. diameter and very loud, working parts incased in nickeled covers—which you like, either vibrator or single stroke.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

A. D. BARBER, Jr., President.  
F. W. H. SHEFFIELD, Sec. and Treas.

LICENSED MANUFACTURERS OF AMERICAN BELL TELEPHONE CO.

Manufacturers of all kinds of Telegraph, Telephone and Electric Light Supplies.

## NEW NO. 2 MAGNETO BELL.

POST & CO.'S

## New No. 2 Magneto Bell.

## Standard No. 1 Magneto Bell, 20,000 in use.

CINCINNATI, Aug. 1, 1881.

Below we give a few important changes we have just made in our Standard Magneto Bells, making them the strongest and best Bells made. All of these important points fully covered by Letters Patent.

1st. Our Horse Shoe Magnets, large and small, are made to lift six times their weight; none are passed unless this result is obtained. This strength is secured by means ONLY KNOWN TO US.

2d. The cylinders of our engine are metallic and inclosed so as to prevent escapes of any kind, and also prevent dust from accumulating on the armature, which in a very short space of time would wear out and destroy the GENERATING POWER of the ENGINE. Other makers NECESSARILY leave the sides open.

3d. Our switch is so constructed that it prevents lightning in ANY FORM from ENTERING THE MICROPHONE, by cutting out the primary and secondary coils entirely—a feature that no other box now manufactured has, and fully covered by our letters patent.

4th. We make the Automatic Hook Bell to use with the PONY CROWN TELEPHONE. NO EXTRA CHARGE. No posts on front. Connection made at top and bottom of Bells.

5th. All Bells tested to not less than 12,000 ohms resistance.

6th. We have so arranged the RINGER, GENERATOR, and FRAME work of our Bells that they can be easily adjusted without disturbing the wires in any manner or moving the base-board or bell.

7th. Test of Standard Magneto Bells at Exposition, Oct. 1, 1880.

Williams Magneto Bells rang through 11,800 ohms resistance, equal to say 370 miles No. 12 wire.

Post & Co.'s Magneto Bells rang through 19,775 ohms resistance, equal to say 625 miles No. 12 wire.

The record of this test is taken from Report of the Jurors in Class 77 on Electrical Instruments, and NEEDS NO COMMENT, as it shows our Bells have nearly double the strength of the others. The Gilliland Bell did not come in, although APPLICATION had been filed to enter same for competition. The jury awarded our Bell the HIGHEST PREMIUM—A SILVER MEDAL. Respectfully, POST & COMPANY.

CINCINNATI, Aug. 1, 1881.  
We have just perfected our New No. 2 Automatic Magneto Bell (as per cuts), and are now ready to furnish same to Exchanges and Agents of the American Bell Telephone Co. We guarantee same to ring over 10 miles of wire. We have given great attention to the construction of these bells and they will be found just the bells for short lines of all kinds—will gladly send out one bell or a case of 6 on approbation, to be returned if not satisfactory.

We call especial attention to our new switch-boards as being simple and substantial, NO CORDS TO GET OUT OF ORDER. We make them from 6 lines each up to any size wanted. Send for cuts of same. Our new battery boxes open down the front, so as to get at battery easy. We make them two sizes, for each size bell, also very fine ones for parlors and fine offices. Samples of our bells, etc., sent on application. Agents for Roebling's line wire. A full line of OFFICE WIRE, BRACKETS, INSULATORS, etc., on hand at all times at VERY LOWEST prices. Send for catalogue and prices.

POST & COMPANY, CINCINNATI, O.

# THE "MORSE" LEARNERS' INSTRUMENT.

THE BEST.

Price, \$4.50, complete with Battery, Book of Instruction, Wire, Chemicals, and all necessary materials for operating.  
"Morse" instrument alone, without battery..... \$3.80  
"Morse" instrument, without battery, and wound with fine wire for lines of one to fifteen miles..... 4.50  
"Morse" instrument, complete..... 65  
"Morse" Learners' Instrument, without battery, sent by mail..... 4.30  
(Battery cannot be sent by mail.)

GOODS SENT C. O. D. TO ALL POINTS IF ONE-THIRD OF THE AMOUNT OF THE BILL IS SENT WITH THE ORDER.  
REMIT BY DRAFT, POSTAL MONEY ORDER, OR REGISTERED LETTER.

Favorable Arrangements Made With Agents Everywhere.

## THE "MORSE"

Is a full-size, well-made, complete MORSE TELEGRAPH apparatus of the latest and best form for learners, including handsome Giant Sounder and Curved Key, and a large Cell of the best Gravity Battery, latest form.

It is the best working set of Learners' Instruments for short or long lines, from a few feet up to 20 miles in length.

**YET OFFERED!**

You are SURE of Getting  
**THE BEST THAT IS MADE**

IF YOU SELECT THE "MORSE."

We will in every case refund any remittance made us for these goods, if they are not found to be Entirely Satisfactory.

**J. H. BUNNELL & CO., 112 LIBERTY ST., NEW YORK.**

## All Persons Sending for

Catalogues or ordering articles advertised in our columns will do us and our Advertisers both a great favor by mentioning that they saw the advertisement in

"THE OPERATOR."

**BROWNLEE & CO.,**

DEALERS IN

## CEDAR TELEGRAPH POLES.

Light Poles for Telephone Lines and Long Poles for City Use Constantly on Hand.

OFFICE: FOOT OF SHELBY ST., DETROIT, MICH.

**HENRY LINDENMEYR,**  
**PAPER WAREHOUSE,**  
Nos. 15 & 17 Beekman St., New York.  
ALL KINDS OF PAPER MADE TO ORDER.

## COMPLETE SETS OF MACHINERY

FOR THE MANUFACTURE OF

## Telegraph Cables.

Wire Stranding Machines.

Complete sets of Machinery for Purifying India Rubber and Gutta Percha, and Insulating Wire.

Lapping Machines for Covering Wire with Silk, Cotton, Flax, Hemp, Tape, etc.

**THOMAS BARRACLOUGH,**  
8 KING STREET,  
Manchester, - - England.

## BEST TELEPHONE EXCHANGE SWITCH BOARD IN THE WORLD. SUPERSEDING ALL OTHERS.

Sample and Circular sent to Exchanges on application.

**C. E. JONES & BRO., Cincinnati, O.**

## BALDWIN, HOPKINS & PEYTON, PATENT ATTORNEYS, WASHINGTON, D. C.

Established 1859. Local References Furnished.  
Patent solicitation and litigation exclusively, in all its branches. Electricity a specialty.

## SHORTHAND. TAKICGRAPHY,

The Standard System,  
successfully taught by mail. A Complete System in a "nut-shell." Send five cents and stamp for copy.

**E. W. FARNHAM,**

General Western Agent, 72 Monroe Street, Chicago.

WITH UNIVERSAL ANKLE-MOTION.

SATISFACTION GUARANTEED.

ARMS WITH FULL FINGER-MOTION.

Address, GEO. R. FULLER

(Successor to Dr. D. BLY),

27 ARCADE, Rochester, N. Y.

## THE EUROPEAN Telephonic Signal Association

are now prepared to receive orders for their

## INDIVIDUAL BELL ATTACHMENT,

and solicit the correspondence of Exchanges in relation thereto. We offer a Simple, Compact and Easily-Attached Apparatus, which individualizes the call with Absolute Certainty.

**FRED. S. POTTER, Trustee,**  
New Bedford, Mass.

**LITTLE GIANT  
FRENCH BATTERY  
RELIEVES  
RHEUMATISM  
AND ALL  
NERVOUS COMPLAINTS.  
Supersedes all others.  
Send for circular.**

## SECOND-HAND MORSE REGISTERS.

We have on hand a lot of best makes, which have been overhauled and polished. They are as good as new, and we will sell them very cheap.

**DAVIS & WATTS,**  
BALTIMORE, MD.

## MUTUAL DISTRICT TELEGRAPH CO.

EXECUTIVE OFFICES,  
29 MURRAY STREET, NEW YORK.

Offices are being fitted up in various portions of the city for the purpose of furnishing

## MESSANGER, POLICE and FIRE SERVICE.

NO RENT WILL BE CHARGED FOR CALL BOXES.

The patronage of the public is respectfully solicited.

**H. W. POPE,**  
Vice-President and General Manager.

## THE PATENT Telegraph & Light Section Hand Car.

Our New Two-man Car, lately introduced on a number of prominent roads, is giving entire satisfaction. Full Descriptive Circulars sent on application.

**GEO. S. SHEFFIELD & CO.,**  
Sole Manufacturers,  
Three Rivers, Mich.

## PURE ELECTRIC WIRE.

MANUFACTURED BY THE

**Ansonia Brass and Copper Co.,**

For Magnets, Telegraphs, Telephones, etc., Insulated on the Bare Wire with **H. Splittorf's Patented Liquid Insulation, covered with cotton or silk.**

All sizes of **BARE AND COVERED WIRE** in stock. The Conductivity of every bundle tested and warranted.

**THE ANSONIA WROUGHTGONGS** for Clocks, Indicators, Telephones, Call-Bells, Bell-Punches, Steam-boat and Railroad use—burnished or nickel-plated.  
**19 CLIFF ST., NEW YORK.**

## HOLCOMBE'S NEW AMPLIFYING TELEPHONES

FOR PRIVATE LINES.

PATENTED APRIL 26, 1881.

The Only Reliable Substitute for the Costly Electric and Magnetic Telephones.

NO ROYALTY! NO EXORBITANT RENTAL FEE!

SOLD OUTRIGHT AT MODERATE PRICES.

They transmit Conversation, Music, Signals, Commercial Orders, or any audible sound with almost electric speed and surprising fidelity. The tones are clear, natural and distinct; every word is easily understood.

These instruments work well in all kinds of weather, and may be relied upon for effective service at all times. They are complete in themselves, and are perfect and durable in every part. Elegantly finished. Warranted to work two miles; *Reliable and efficient.* Price, \$10 per set *net.* WIRE.—With these new Telephones we use Galvanized Steel Cable Wire of great strength and conductivity. It does not stretch or break, and makes a very permanent line. PRICES: Double wire for short lines, 3 cents per rod, by express; *treble* wire for long lines, 5 cents per rod, by express. Metal Insulators, 5 cents each.

**\$4.00 Telephones.**—We also furnish the Improved Automatic (Patented) Telephones for short lines. They work excellently, and are certainly the best telephones for the price now made. Price per set, \$4.00 *net.* Wire for these Telephones, 3 cents per rod, by express. Insulators, 3 cents each.

Illustrated descriptive circulars, testimonials, etc., sent free on application. Correspondence solicited. Terms, cash with order. Address all orders to the Patentees and Proprietors,

**J. R. HOLCOMBE & CO., Mallett Creek, Ohio.**  
[Mention THE OPERATOR.]

VOL. XII.—No. 19.

NEW YORK, OCTOBER 1, 1881.

{ ONE DOLLAR A YEAR.  
5 CENTS PER COPY.

### THE SONG OF THE CARBONS.

[The universal physical law of molecular vibration well illustrated in the carbon pencils of the electric arc-light used in some of the largest lighthouses. The molecular stir set up in the armatures of the dynamo machines by rapid magnetization and demagnetization is transmitted to the carbon points of the lantern and reappears as a distinct musical tone.]

A weird, sweet melody, faint and far,  
A humming murmur, a rhythmic ring,  
Floats down from the tower where the lenses are;  
Can you hear the song which the carbons sing?

Millions of æons have rolled away  
In the grand chorale which the stars rehearse,  
Since the note, so sweet in our song to-day,  
Was struck in the chord of the Universe.

The vast vibration went floating on  
Through the diapason of Space and Time,  
Till the impulse swelled to a deeper tone  
And mellowed and thrilled with a finer rhyme.

Backward and forward the atoms go,  
In the surging tide of that soundless sea  
Whose billows from nowhere to nowhere flow,  
As they break on the sands of Eternity.

Yet through all the coasts of the endless All,  
In the ages to come, as in ages gone,  
We feel but the throb of that mystic thrall  
Which binds, responsive, the whole in one.

We feel but the pulse of that viewless Hand  
Which ever has been and still shall be,  
In the stellar orb and the grain of sand,  
Through Nature's endless paternity.

The smile which plays in the maiden's glance,  
Or stirs in the beat of an insect's wing,  
Is of kin with the North-light's spectral dance,  
Or the dazzling zone of the planet's ring.

From our lonely tower, aloft in air,  
With the breezes round us, tranquil and free—  
When the storm rack pales in the lightning's glare,  
Or the starlight sleeps in the sleeping sea—

We send our greeting, through breathless space  
To our distant cousins, the nebulae,  
And catch, in the comet's misty trace,  
But a drifting leaf from the tribal tree.

The song we hum is but one faint sound  
In the hymn which echoes from pole to pole,  
Which fills the domes of Creation's round,  
And catches its key from the Over-Soul!

And when it ceases, all life shall fail,  
Time's metronome shall arrested stand;  
All voice be voiceless—the stars turn pale—  
And the Great Conductor shall drop his wand!

### The Congress of Electricians at Paris.

[From The Operator's Special Correspondent.]

The Electrical Exhibition may now be said to be fairly opened, although even at this late day there are a few exhibits not yet installed.

That most conspicuous by its absence is Edison's great machine, which everyone has been looking

for and inquiring about for the past month. We are assured by those who ought to know that it is now on the way, and much interest is manifested regarding it and the wonderful things it is going to do, all of which I hope to be able to touch upon in my next.

The Brush Company has on exhibit the largest electric lamp in the world, giving, it is claimed, 150,000 candle power of light, and requiring the current from one of their largest generators, driven by a 30 horse-power engine. When the current is on full head its passage between the carbons (which are two inches in diameter) makes a deafening noise, while the light is almost blinding. A use has not been suggested for this electrical monster, and it remains silent and dark in its corner, seeming to envy its smaller fellows, who are more fortunate, inasmuch as they are more useful. It is understood that the Brush Company has just sold its rights for France, and a fabulous sum is mentioned as the price. The Credit Lyonnais are the purchasers.

The Maxim light has not been very much of a success so far. The engine used for driving its generators was badly placed and produced a poor light, which it would not do to exhibit where there is such hot competition. After a few nights' experience it was decided to suspend entirely and rearrange the machinery. At present the rooms formerly lighted by Maxim are lighted by Weston lamps.

The Congress assembles on Thursday next, and the jurors will immediately get to work making their tests and examinations, and, later on, awarding the prizes. We Americans, with our usual innate modesty, are making no claims yet and keeping quiet on what we have to show, but this does not keep us from thinking that we are going to carry off the lion's share of the awards all the same.

The following is the full programme of the Congress:

The Congress will be divided into three sections, comprising: First, physicians, chemists, physiologists, and, in general, persons who study electricity from a theoretical point of view. Second, telegraphists and engineers of railroad telegraphs. Third, electricians and engineers engaged in other applications of electricity, civil or military. Members of the Congress may belong to the several sections. The sessions will be held at different hours so that all may take part.

The sessions of the Congress will comprise: First, full sessions devoted to the discussion of questions of an international character, and requiring a vote of the Congress. Second, sessions devoted to the illustration and discussion of questions having a special interest on which an exchange of views and information will be use-

ful. Third, public sessions, in the form of conferences, at which will be illustrated, by such members of the Congress as desire, some of the questions of interest at the time.

FIRST PART.—Full sessions; general questions submitted to the Congress:

#### 1. Electric units:

The necessity for the general adoption of an international system of electrical measures; the choice of the unit system to be adopted and the denominations to be used; what measures to be taken for the establishment, preservation and reproduction of international standards; is it not necessary to constitute an international commission for this purpose? could this commission not be attached to the International Bureau of Weights and Measures?

#### 2. International telegraphy:

What measures to be taken to facilitate the service of international lines; means to assure the use of the same terms and units for the designation of the elements that influence the working of international lines; is it not possible to organize an international study of earth currents? Agreements regulating the laying of submarine cables in cases of juxtaposition or crossing; the establishment of distinctive signals and rules of navigation for the use of vessels laying or raising submarine cables.

#### 3. Divers applications of electricity:

What measures to be taken to facilitate international relations concerning certain special applications of electricity. (The solution of these special questions will be aided by the discussion that will have taken place in the different sections.) The electric light—measures to be taken to facilitate the comparison of luminous intensities. Electro-physiology—measures to be taken to facilitate a comparison of results obtained in the employment of electro-medical apparatus. Lightning rods—measures to be taken for the compiling of statistical information regarding the efficiency of the different systems of lightning rods now in use.

SECOND PART.—The sections. Special questions for the exchange of useful ideas:

First Section.—Theory; sources of electricity; lightning rods; electro-physiology.

1. Questions concerning the theory of electricity. 2. Relative to the measurement of constant or alternating currents of great intensity. 3. Concerning the constitution of the globe: atmospheric electricity and terrestrial magnetism. 4. Lightning rods; discussions on the best conditions for establishing lightning rods; is it possible to compile a table of international statistics on the value of different systems now in use? 5. Questions concerning electro-physiology: the necessity for defining in a scientific way the currents used in medical operations, and to attach to them a measure of electric units: the best means to be employed to determine the nature of electrical phenomena produced upon animals. 6. Other questions reserved for introduction by members of the Congress.

Second Section.—The transmission of signals and speech by electricity, telegraphy, telephony, railroading.

1. Questions concerning telegraphy; compari-

son of batteries and instruments; the best means for establishing overhead, underground and submarine telegraphs, regarding their conductivity and insulation; advantages and disadvantages of the employment of relays and long lines; the use of lightning rods and arresters on telegraph wires; their advantages and disadvantages. 2. Questions concerning telephony; the special difficulties to be overcome in the establishment of telephonic lines; the causes of the noises heard on telephone wires. 3. Questions concerning railroads; the application of electricity for the greater security of railroads; comparison of the different systems of automatic and other signals. 4. Other questions reserved for introduction by members of the Congress.

**Third Section.**—Industrial applications of electricity.

1. Questions concerning electric lighting; the measure of luminous intensity by electrical means; comparison of different photometric processes; the need of an absolute unit for the measure of luminous intensity; does there exist a measure that can be recommended as an international standard? is it possible to establish simple rules for photometric measurement? comparison of the results obtained from constant and alternating current generators; special conditions for the application of the electric light to cities, factories, mines, dwelling houses, lighthouses, vessels, etc. 2. Questions concerning the transmission of power to a distance by electricity; the employment of electricity for transmitting power, know facts, results obtained, difficulties to solve; the utilization of natural forces by means of electricity; divers applications. 3. The distribution of electricity for industrial purposes. 4. Electric clocks and chronographs; registering apparatus and instruments of precision; geodetic measurements. 5. Electro-metallurgy and applications of electricity to chemistry. 6. Other questions reserved for introduction by members of the Congress.

**THIRD PART.**—Public conferences Among the questions to be treated in the public conferences the Commission gives special notice of the following: 1. Electric measures. 2. Electric lighting. 3. The transmission of power by electricity. 4. The telephone and its applications. 5. Atmospheric electricity and lightning rods. 6. Terrestrial magnetism.

It will be seen from the above that the discussions will have a wide range, and the decisions arrived at by such a body of scientists will be exceedingly valuable.

Mr. Marcel Deprez, the well-known French electrician, is installing an exhibit by which he will illustrate an entirely new method for the division and transmission of power. He uses a single Gramme machine for a generator, which supplies him with enough electricity to run twelve or fifteen small motors, and each motor has power enough to drive a sewing machine, a scroll saw, a pleating machine, or any such small piece of mechanism, and he throws all, or only one, into circuit without changing the speed of any. This beautiful result is attained by some system of electric regulator or governor attached to the generator, which increases or decreases the power of the field magnet, according to the quantity of current required. The governing portion of the apparatus is entirely electric, but its mode of working has not yet been made public, and will not be until it is ready for exhibition. The journal *La Lumière Electrique* is to be printed in the exhibition building by presses run by these motors.

It is curious to notice how far behind the age the people in France, and, in fact, all over Europe, are in regard to telegraphy. In England the sound system is being very slowly introduced, but in the other European countries it is *against the law* to receive by sound. The old cumbersome registers that we used and shelved years ago are employed, and they cannot or will not see that they are behind the times. It is not generally believed that American operators can send or receive 35 and 40 words a minute by sound,

and there is unfortunately but one practical operator here or an exhibition might be given. Some steps have already been taken to have two or more really first-class American operators come to Paris to give an exhibition of what is done on the other side of the Atlantic, and one gentleman, who is going into the instrument manufacturing business here, has offered to pay half the expenses provided another can be found who will pay the other half. Your correspondent has some reason to believe that the other half will be forthcoming.

#### Review of the Past Two Weeks.

The past fortnight has been remarkable for the continued fierceness of the terrific onslaught from outsiders upon the Western Union. The condition of the employes has in the meantime been improved, if anything; and, as the latter class has little concern with the grievances of the general public, the whirlwind of criticism has blown exclusively from the latter quarter. No attempt to reduce salaries or increase hours of labor has been made since our last issue; extra services have been fairly paid for; and, altogether, the danger to operators, if any exist, seems to be entirely prospective. For so much we have to be thankful, though not forgetting the time-honored injunction about eternal vigilance.

The New York *Herald* seems to have established a permanent column for discussing "Defective Telegraph Service." These daily examples, if true, are disgraceful to the service. Thus (*Herald*, Sept. 17), one man, in New York, writes that the Western Union after losing his message "tried to collect seventy-three cents from my wife, and upbraided her because she refused" to pay it. A Wilkes-barre, Penn., man writes (*Herald*, Sept. 23): "A few days ago I received another gentleman's dispatch done up in my envelope. Not long since a dispatch came to me which I couldn't read at all, on account of its being blurred and so badly spelled, and I was compelled to leave my office and walk quite half a mile to their office in order to get it deciphered. On Monday last a dispatch was handed to me by a messenger boy at ten minutes past six P. M., which had been received at the telegraph office at fifteen minutes after two, and when I asked the boy the cause of the delay he replied, 'Guess it was forgotten.' That delay will probably cost me over a hundred dollars." The *Herald* then, editorially and in its Wall street reports, indorses these criticisms. "Since the consolidation swindle," it says in its issue of Sept. 17, "and the passage of the united lines under Mr. Gould's control, the service has simply been allowed to go to the dogs. From being an instrument of public service, Western Union is being used as a jackscrew to the rest of the market. When Mr. Gould desires a rise in prices he intimates it by screwing Western Union up; when he desires a decline he twists it down. Consequently this great telegraph company, from being of utmost importance as a popular convenience and necessity, has been reduced to the level of a stock-gambling machine, which Mr. Gould is driving for his own special gain and convenience. To keep the price up and pay dividends upon a stock which has been inflated to the point of bursting, it has been found necessary to cut and carve expenses in every direction. Salaries have been reduced, first-class operators have been shown the door and their places have been filled by cheap and incompetent substitutes." Then it adds, editorially: "First-class operators have been driven from their positions by reductions of salaries, poles and wires have been allowed to go to ruin, country offices have been squeezed out of existence, and the whole service has been allowed to drift into a condition of disability that creates universal disgust. All this to permit Mr. Gould to earn a dividend upon the inflated stock of which he is the proprietor. Unfortunately for Mr. Gould, all this lopping off and trimming down of expenses is not sufficient to screw out from the current earnings the necessary dividend. To provide for the deficiency and to make things pleasant, some hundreds of thousands of dollars of the company's assets have been sold and the proceeds

turned in to the credit of the dividend account."

The complaints from the country at large are also very bitter, the following from the Dallas (Tex.) *Herald*, of Sept. 11, being a fair specimen of the charges made: "We are compelled again this morning to ask the indulgence of our readers for the scarcity of telegraphic matter. We have complained and continued to complain of the treatment we are receiving from the Western Union Telegraph Company, and not only is this the case with us and with the merchants of Dallas, but it is true also with the merchants and with the press in Fort Worth."

The San Antonio *Express*, referring to the above, says: "It would pay the company to stretch more wires and make fewer dividends for the next year or two."

The St. Louis *Globe-Democrat* says the service in that city is "thoroughly bad." The newspaper service is "wretched," while the commercial service is "actually detrimental to the city's commercial interests."

Of course, this has been very annoying to the managers of the Western Union, but it seems to have acted as a stimulus to enterprise.

The *Sun*, of this city, in its issue of Sept. 19, gives the following as an interview with a gentleman intimately connected with Mr. Gould: "When Gould saw Friday's *Herald* he became perfectly mad, he damned Bennett, damned Vanderbilt, damned Keene and everybody around him besides. I never saw him in such a rage before. The *Herald* has upset his whole programme. He evidently intended to sustain the market by putting Western Union up to par, and quietly sell it out with some other stocks meanwhile. Bennett's attack broke the plan all up. He had to buy the general list for the sake of sustaining the price of Western Union. When he cooled down a little he ordered Washington Connor to send word to Charley Minton, the financial editor of the *Herald*, to come and have a chat with him. But the answer was that Mr. Gould had to go to chat with Mr. Bennett, if he wanted to chat on the subject of Western Union. Gould got mad again, and gave additional orders to sustain the general market." Since we have no desire to place Brother Jay in such a shockingly bad light before the public, we must repeat that the foregoing statement is from the New York *Sun* of Sept. 19.

But, perhaps, the unkindest cut of all came in an official communication from the President of the Produce Exchange, as follows:

NEW YORK PRODUCE EXCHANGE, }  
NEW YORK, Sept. 16, 1881.

Gen. Thomas T. Eckert, General Superintendent  
Western Union Telegraph Company:

DEAR SIR: Very serious complaints are being made to me that the facilities for transmitting telegraph dispatches between this Exchange and the West are entirely inadequate for the volume of business now being transacted. I desire to call your immediate attention to this matter, and to respectfully request that such additional wires and other facilities may be provided as shall promptly meet the requirements of the members of this Exchange. Respectfully yours,

F. H. PARKER, President.

To this General Eckert sent the following reply:

WESTERN UNION TELEGRAPH COMPANY, }  
NEW YORK, Sept. 17, 1881.

F. H. Parker, Esq., President Produce Exchange,  
New York City:

DEAR SIR: I am this morning in receipt of your letter of yesterday, which, however, first came to my notice in the newspapers before I reached my office. Permit me to say that I can hardly consider your course in publishing such a document before it was possible for you to receive a reply to it consistent with commercial courtesy. I shall, therefore, endeavor to give similar publicity to this letter, that the company may be saved from the reflections the unqualified terms of your complaint are calculated to throw upon it. The facilities of this company for the transmission of dispatches to and from the West are more than adequate to the demands of ordinary business. But the delays which have occurred during the last few weeks have been due to three causes, which were entirely unforeseen, and against which it was impossible for us to make immediate provision, viz.:

**First**—The attempted assassination of the President created a demand upon us throughout the country to which it became our duty to give the first attention. So great has this demand been that the company has transmitted about 2,000,000 bulletins (equivalent to 4,000,000 messages of average length) since the 2d of July last. And I presume the most captious will hardly complain because we have made so great an effort to assuage the anxiety of the people at large during a most terrible national calamity.

**Second**—The forest fires in the Middle and Western

States have caused continual interruptions to our wires, in some instances prostrating all our trunk lines and cutting us off from any communication with Chicago and other Western produce markets. The authentic reports of the devastation those fires have made in the localities through which our lines pass give sufficient evidence of the difficulty we have had in coping with troubles entirely beyond human control.

**Third**—The increase in the number of commercial messages has been far beyond the natural growth of business expected, being more than 50 per cent. above that of the same season of any year in the company's history, and far beyond any reasonable anticipations. This enormous increase is pressed for immediate transmission during about five hours of the business day, and the very prompt service the company has been rendering has so increased the exactions of that class of customers that nothing short of immediate transmission will avoid complaint.

The first two of these causes are entirely temporary, but, combined with the third, have made a demand upon us of such magnitude that no provision the Western Union Telegraph Company could have made would have been sufficient to insure the same precision in its business as under other circumstances. We are, however, making every effort to transmit our messages with the utmost dispatch, our employes are rendering faithful and efficient service, and our facilities are being so increased as to make ample provision for any requirements of the public; the erection of about 10,000 miles of new wire having been commenced in the early spring, and as much more has since been undertaken in consequence of the extraordinary demands. We are pushing this work with all the energy possible, and in view of the circumstances above recited, and of the fact that to erect wires for distances so great, for example, as between Chicago and this point, is a work of time, I have no doubt we shall receive from the public at large, and from all business men especially, a reasonable degree of consideration.

Yours respectfully, THOMAS T. ECKERT,  
Vice-President and General Manager.

Gen. Eckert said to a reporter that for the two million bulletins mentioned in the foregoing letter the company did not receive a cent; he was very glad to do it gratuitously for the public, and that if those bulletins had been charged for at only one-half the regular commercial rates they would have realized over half a million dollars.

President Norvin Green said: "There is not a word of truth in any of these stories of the discharge of operators by this company from motives of economy. The only discharges made have been for incompetency or some other equally good cause. So far from discharging men, our executive committee met to-day and approved of the appointment of a large number of operators. We are working more operators now than we ever worked before, and still we are employing men as fast as we can get them. I would be afraid to tell you how much we are in need of operators."

The New York World, which—rightfully or wrongfully we cannot say—enjoys the reputation of being Mr. Gould's personal organ, steadily defends the Western Union management; accuses the Herald of entertaining base motives, and even quotes the statute bearing upon certain libels, all for the benefit of the Herald.

The result of the two weeks' campaign may be summed up as follows: Western Union at the date of our last issue, 92¼; Western Union to-day, 86⅞.

The last financial report of the Western Union Company will be found in another column.

With regard to the opposition companies it may be said that the prospects for them all, except, possibly, the alleged "Postal Telegraph," are decidedly encouraging. The Mutual Union, which is displaying astonishing vitality, has secured the services of Mr. James Gamble, late of the Western Union, as General Manager. That company expects to be open and well established at all important points some time during this month. In this connection Mr. Rufus Hatch recently said, very pithily, "If the little American Union, only in existence less than eighteen months, could reduce the price of Western Union to 77 on \$40,000,000 of capital (in the trial before Judge Truax one of the Western Union's officers swore that the American Union was cutting into them so deeply that they would have to pass their dividends), a moderate use of the rule of three and simple proportion will show what the effect will be on double the capital of Western Union with the Mutual Union at work." The Mutual Union expects, furthermore, to open to Chicago with no less than 16 wires—possibly 20—and add to these as fast as needed.

Mr. George W. Ballou, one of the principal members of the company, said that the entire line between New York and Chicago, by way of Albany, Buffalo, Cleveland, Toledo and Detroit, would be completed and opened for business by the 15th of October, and that another line would soon connect Boston with Albany via Springfield, Mass. He said, further, that a contract has been made with the Chicago & Milwaukee Telegraph Company for the use of their lines between Chicago and Milwaukee, and it is expected that the new lines which are being built between Milwaukee and St. Paul and Chicago and St. Louis by the Mutual Union Telegraph Company will be finished simultaneously with the line from New York to Chicago. The Canada Mutual Telegraph Company is building lines to all the leading cities in Canada, which will be finished this year and will be amalgamated with the Mutual Union system. Mr. C. R. Hosmer, late superintendent of the old Dominion, has resigned and taken entire charge of the Canada Mutual Company. Arrangements have been made with the Baltimore & Ohio for an interchange of business, which will give the Mutual Union Company all the 220 offices of the Baltimore and Ohio.

A contract for a term of years has been made between the Eastern Railroad Co. and the Mutual Union, whereby the latter secures the right to construct and operate lines of telegraph along the main line of the road and all its branches. Nearly 4,000 heavy cedar poles on platform cars are now at the different sidings ready for distribution, and work is to be pushed at once by large gangs of construction men. Three gangs have started at the Portland end, building east to Bangor and intermediate points. Supt. Hern has arranged for suitable office locations, etc. The Mutual Union lines west, via Worcester and Springfield, are also being vigorously pushed to completion.

At the last monthly meeting of the Directors of the Baltimore & Ohio Railroad Company the president stated that the telegraph system of the B. & O. Co. already extends over a territory of 2,159 miles. It owns and operates over 11,000 miles of wire, and interchanges business beyond its own lines with many existing telegraph organizations. In view of the growth and magnitude of the express and telegraph systems of the Baltimore & Ohio Company, the organization and promotion of the interests of which require continuous supervision to insure their effective development and increased usefulness, the President stated that it had been deemed desirable to obtain the services of a general manager of the express and telegraph systems of the company. He, therefore, nominated for this office Mr. Geo. P. Frick. The nomination was approved and the appointment made.

The Western Union seems to have got its lawyers and wood-choppers at work again, in the old familiar methods of fighting the opposition. On the 21st ult., at Baltimore, its solicitor filed an amended bill in the suit against the Baltimore & Ohio Railroad Company in the United States District Court. The matter in controversy is in relation to the right to control and operate the telegraph lines along the lines of the railroad company between Baltimore City and Wheeling, W. Va., and has been going on under various forms since 1877. The Western Union Company contend in their bill that, under various grants and purchases, they had acquired the sole right to maintain and operate telegraph wires for general business along the line, and that in 1877 the Baltimore & Ohio Railroad caused the lines of the company to be disconnected, and deprived them of the right to carry on the telegraph business under their contracts. They ask relief in equity, and pray for an injunction to prohibit the Baltimore & Ohio Railroad Company from maintaining and using the line of telegraph between Baltimore and Wheeling; also from preventing the Western Union Company connecting its line with the wires of the railroad company, and establishing telegraph stations at any point on the line, and finally, from contracting with any company other than the Western Union Company for the use of the said wires for the purpose of carrying on the business of telegraphing.

A letter to the N. Y. Herald, dated Sept. 21, says: "On Saturday last a party of five telegraph linemen drove from Flemington, N. J., toward Whitehouse, over the route of the Bankers and Merchants' Telegraph Company and

chopped down thirty-eight of their poles. This is the third raid that has been made on the property of this company, and four men in the employ of the Western Union Telegraph Company are now held to bail for the different cuttings. The bail in each instance was furnished by officers of the latter company, or Telephone Company, both being identical in interest."

Other pole-cutting outrages are reported; but, as the Western Union officials intimate that these new companies saw down their own poles for the purpose of creating public sympathy, we shall have to await a judicial decision in the case of those under arrest.

### An Excellent Suggestion.

To the Editor of The Operator:

SIR: Your correspondent desires in this letter to offer a few words upon a subject, the great importance of which he believes will at once become manifest to all operators whom it may reach, and he hopes that every operator in the land will be led to seriously consider the suggestions here to follow:

The new opposition telegraph companies have now reached that stage in their construction where they are venturing to open to the public their facilities for business, and are just making known their requirements for the best operating talent that the country affords. Already a few operators have been induced to leave this office, at a trifling advance of salaries. It is too apparent that we are to have the old story over again, of a general stampede to the "opposition," with entirely insufficient inducements to warrant such a movement. The argument against these hasty changes may be briefly put. The best operators are now, with some exceptions (among them those engaged in other pursuits), employed by the Western Union Telegraph Co., and nearly every one of them is necessary to the tolerable transaction of its business. In view of outside demands, then, does it not seem that the time is at hand when all "first-class" operators should exercise some business forethought in estimating the value of their services—when such men should have something to say about establishing that value, by placing themselves in a position where, by the natural order of supply and demand, there will result a compelled acknowledgment thereof? A "first-class" operator should be understood as one who has, by native sound sense, by long and careful practice, become rapid, correct and reliable in the performance of his duties. Reliable, not only in his ability to read bad copy and all the various combinations of bad senders, and to return as good as he receives, but also reliable in his habits of appearing regularly at his allotted post. To all such your correspondent would urge most earnestly that they do not entertain any offer from an "opposition" company of a salary less than one hundred dollars per month. (The figure should be 125.) The studious labors of half a lifetime in a business of most vital and far-reaching importance, involving questions of life and death, and frequently the possession or loss of millions in treasure, entitle you, certainly, to the very moderate and modest return for your services of the price above noted. You now have it justly within your power to thus promote your own material interests, as well as the interest of others of the craft, for the placing of maximum salaries upon a higher and fairer plane will, of course, stimulate the lower grades to commendable and more careful efforts in improvement; it will discourage evil-doers, and, too, there will be recalled most of the first-class talent, now stationed at unimportant posts, or retired in less important callings; the condition of the service of all telegraph companies will receive a healthier tone and an efficiency they have not heretofore known. BON SORR.

CHICAGO, Sept. 24, 1881.

The section of the Brazilian submarine cable from Para to Cayenne is useless, owing to the destruction of its insulation by fish bites. These bites take place only within a distance of forty miles skirting the coast of an island in the estuary of the Amazon. Examinations show that the cable is attacked by some powerful fish, whose jaws crush the iron sheathing of the cables and displace the insulating substance.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, OCTOBER 1, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### UNTO THIS LAST.

Since our last issue our stainless, ill-starred President, James A. Garfield, has passed away, seemingly at the high noon of his life, and after eleven weeks of unimaginable suffering. In common with other universally expressed marks of affection and profound regret, the Western Union Telegraph Company has formally deplored his loss, and directed that its principal offices should be draped in mourning.

This distinguished scholar and most amiable gentleman—the child of poverty and hardship, and now among the greatest of our noble host of great men—is endeared to us, as telegraphers, by even closer ties than to the general public, since he is remembered by us as one of the earliest friends and most staunch supporters of the electric telegraph. His fervid recognition of the late Professor Morse, and the utility of the telegraph in general, expressed in his admirable speech at the Morse Memorial Meeting in the hall of the House of Representatives, at Washington, April 16, 1872; and, later, his eulogy upon Professor Henry, together with the glorious memories which he so skillfully clustered around those illustrious Americans, couched in “words that burn” and must forever go whirling down the ringing grooves of time, are still fresh in the memories of us all. From the contemplation of these memorable orations we had come to regard him as the especial champion in Congress of the telegraph and telegraphers, and recalling now his fervid interest in all that pertains to our honored profession, his terrible death at the hands of a miserable, good-for-nothing, skulking assassin is made doubly shocking. We who, day and night, for months past, have wrought and toiled, literally by his bedside, have, perhaps, more than the general body of our citizens, acquired from this close connection a deep interest in the illustrious dead. We were the witnesses, just after his inauguration, of the dutiful son’s kiss imprinted on the trembling lips of his aged mother; we have copied and recopied for many an hour the letter which, when Death had almost palsied his fingers, he wrote to that devoted mother; we saw and copied his prophecy, “Strangulatus Pro Republica,” written at the same time and by the same weary hand; the affectionate embraces between the dying husband and the noble wife, father and child, and in all we have learned that he who for so long had taught us to live could better teach us how to die. James A. Garfield—soldier, statesman, orator and typical Christian—may he rest in peace!

A HALF million dollars is not a mean capital for a young man to start life on; yet this is what Mr. Jay Gould puts down for his son, George J., twenty-two years old, to start in business—“business” is the respectable name for it in Wall street. But half a million dollars is nothing besides the education such an honorable sire can give him. Let the promising youth study up the Black Friday scheme; let him read the sanctimonious life of James Fisk, Jr., his father’s late lamented partner; let him study how to stand up in a court of law and, “with a broad smile,” that speaks only of pitiless malignity toward the luckless victims, proclaim himself one of the “early birds.” Truly, young Gould has yet much to learn, but he’s on the right track. Then, the noble father has put into this model firm, as full partner, that great truth-teller and patriot, Giovanni Purissimo Morosini. This is, of course, to have him handy in case it should be necessary for anyone to go into a court of law, and there, with uplifted hand and on solemn oath, swear that his name is Giovanni, not George; that he is treasurer of the firm of Connor, Morosini & Gould; that he has held that office since the organization of the firm; that he hasn’t got the books of the firm; doesn’t know where they are; never saw them; never made an entry in them; never kept any account at all; never received any money; never signed any checks; never had any duties as a member of the firm; never received any of the profits; that he knows absolutely nothing about the firm; that he doesn’t know who set him up in business; and, while he will swear it was one of the firm, he has quite forgotten who are the members of his firm. Yes, indeed, the kind and indulgent father has set the tender youth up in a fine, paying business, with some exceedingly unsophisticated and sweet-scented æsthetes for partners. Let us wish him good luck.

DURING the late President’s long sickness the Western Union transmitted from Long Branch alone an average of 100,00 words of press matter per day, independently of Government and private messages, and on the day of his death Long Branch sent 225,000 words of press alone. When we reflect upon the magnitude of this labor, and the enormous telegraphic business transacted elsewhere, it seems hardly credible that in America, only half a century ago, a man was indicted for conspiracy for merely proposing to build a telegraph line.

In *Telegraphic Tales and Telegraphic History*, on page 20, will be found the following paragraph:

“Harrison Gray Dyar in 1823 constructed a telegraph line on Long Island, supporting his wires by glass insulators fixed on trees and poles; the electric signals printed themselves upon litmus paper, the spacing of the mark indicating the letters and other signs. Just as Dyar and his partner Brown were seeking capital to set up a line between New York and Philadelphia (in 1827), a blackmailing agent, failing to extort the concession of a large share in the enterprise, obtained a writ against the two partners on a charge of conspiracy to carry on secret communication between the cities! The case was never brought to trial, but the enterprise was blocked.”

The legal proceedings so frightened them that Mr. Dyar fled from New York, and in 1828 left the United States and made his home abroad. Next Wednesday completes but forty-four years since Professor Morse, Oct. 5, 1837, filed his caveat in Washington for his great invention.

NOTHING could afford us more lively satisfaction than to call wide attention to the timely

letter of our esteemed correspondent at Toledo, Mr. J. M. Cronenberg, asking for the establishment of a telegraphers’ contingent to the Cyrus Field subscription for the family of the late President Garfield, to be known as “The Telegraphers’ Twenty-five Cent Garfield Fund.” Since the original fund was inaugurated by a telegraph man—Mr. Cyrus W. Field—it is meet that it should be closed by the telegraphers in general. After having the Chicago telegraphers’ resolutions of condolence telegraphed over the country, and in some cases sneered at—though devotion like that cannot be sneered at—we have now a chance to give a substantial exhibition of our earnestness and sincerity. Remembering the lively interest of the dead President in everything telegraphic, from his earliest days in Congress down to the last moment, when his great heart broke, we must accord profound respect and the tenderest pity to his bereaved family. The womanly grace and stoical courage of that noble wife should not pass unnoticed; and now, when the shadows of her life are falling and lengthening toward the East, with her children still young and comparatively unprovided for, with their estimable father cruelly butchered, and she crushed under the tremendous load of grief, to provide forever against the tinge of poverty is to bring rest and, in a measure, contentment to the weary mind of that noble woman, Lucretia Garfield.

THE American cable, which was opened for business only a little over a week ago, is already broken. The break is believed to be in deep water, and Mr. Bates is reported to have said that the officers of the company know about where it is, but that he “does not care to mention the locality.” He furthermore thinks the interruption is “very strange.” Of course it was very strange. What has Jay Gould ever done that was not very strange? When the American Cable Company opened for business a couple of weeks ago, after a grand flourish, and charged for the same service fifty per cent. more than the existing cable companies charged, everybody thought it was very strange. And when this unexpected action of the American Cable Co. surprised the “lambs,” and the stock of the Anglo-American Company, which Mr. Gould had been quietly buying in, was greatly enhanced thereby, all the victims thought it was very strange. Then, the sudden breaking of the cable was very strange, as Mr. Bates is reported to have said, and for the benefit of the new firm of Connor, Morosini and Gould junior, we make these little explanations. It is all very strange.

WE should deeply deplore the establishment of the truth of the allegations of pole-cutting made against the Western Union Company in New Jersey, although we believe that the witnesses to the alleged outrages are themselves no strangers to such dastardly business. If true, the charges are only an example of the other man’s ox being gored; but, owing to the high personal character of those officials of the Western Union accused of the crime, we are very loth to circulate or give credit to the stories. If poles have been cut by over-zealous linemen, we hope that they will be severely punished, and that the officials on both sides will leave such wild enthusiasts to the fate which such Nihilistic practices merit. Such a ruffianly style of “competition” is second only in wickedness to throwing dynamite into each other’s offices; and, if one man may saw down another’s pole at dead of night, there is no logic to prevent the other from hiring

Leo Hartman, O'Dynamite Rossa and Guiteau to "compete" in his behalf. We want broad daylight, fair play and free competition—no pole-chopping.

"NOT since that midnight thirty-one years ago, when the toll of bells announced that the hero of Palo Alto had been vanquished by death, have sounds of such import as those of last night been heard. President Harrison died at 12:30, and the people did not learn the fact until the following morning; Lincoln's death, occurring at 7 in the morning, did not call for the midnight bell; and the toll that awoke the sleeping citizens on the death of President Taylor had far less significance in the territory and population which it notified than that of last night. By means of the vast extension of the telegraph all parts of the land heard almost simultaneously the news that President Garfield was no more. Never in the history of the world were intelligence and sympathy more quickly flashed through a whole nation, or the unity of the people in heart as well as in head more fully manifested."—*Boston Journal*.

WE have seen it stated that Postmaster General James intends, in his next annual message, to recommend the establishment here of a postal telegraph service analogous to that of Great Britain. It is not a year since we announced in these columns, upon the authority of Col. James himself, that he was opposed to any such scheme, so that if there be any truth in this rumor his opinions must meanwhile have undergone a complete revolution. Should he be found, under the present vile system of civil service, advocating any such new-fangled notion, it would temper our regret at, as now seems probable, his retirement from President Arthur's Cabinet.

THE President's death, of course, rendered it impossible to hold the Old Timers' reunion at Niagara Falls, as announced. Oct. 26 has now been named as the date. Several prominently connected with the Association are agitating a reconsideration of both the date and place of meeting, in favor of having the reunion take place in New York, at the time of the Mutual Benefit annual meeting in November. In this way many could kill two birds with one stone, and the telegraphers of New York would have an opportunity of extending their hospitality to their visiting brethren. We hope this change will be made.

WE are sorry to see that, in some Western papers devoted to the opposition, editorial articles published in THE OPERATOR have been grossly perverted and then quoted to prove that the recent bad service on the part of the Western Union was due principally to dissatisfaction, disloyalty and incompetence among its operatorial force. We have freely criticised the service as far as was just and necessary, but we never intended that our remarks should be doctored and used, with our name, for campaign purposes between rival companies.

THAT interesting kingling, Kalakaua—or whatever his name is—during a recent visit to Mr. Edison, in this city, remarked that he had a first-rate dynamo machine in his Polynesian home which burned a thousand million tons of coal a day, and the power of which was unlimited. He mildly suggested the laying of submarine cables, and pledged himself in that event to furnish power enough to light the whole of North America. He was referring to the famous volcano, Mauna Loa. It may yet ap-

pear that there was more than idle jest in the royal suggestion.

SHOULD the proposition to add a telegraphic contingent to the Mrs. Garfield fund prove popular with the members of our profession, we hope that everyone will be prompt in remitting. Each large office might appoint a treasurer, who can send us a list of the names and amount of subscription, which we shall promptly turn over to Mr. Field, or to any other responsible party named by the subscribers. One element is especially essential to the success of this scheme—if anything be done at all, it ought to be done at once.

AT an informal meeting of telegraphers, the proposed telegraphers' 25-cent Garfield fund was unanimously indorsed. Many of those present, however, were in favor of subscribing for a monument to the late President, while some were willing to subscribe to both funds. In view of this division of opinion, and of our own doubt on the subject, both objects being equally meritorious, those forwarding subscriptions will please state which object they prefer. We can then count the votes and act accordingly.

WE have heard nothing lately, by the way, of Professor A. Graham Bell's famous induction balance. That delicate instrument located the ball in the body of our late lamented President, indicating the front of the right side of the abdomen, just above the groin, as the precise spot. Yet, cold facts, the result of the autopsy, located the ball far away on the other side of the body, and in the back instead of in front. They had better sell out that stock of induction balances.

THE telegraphers can, if they so choose, astonish Mr. Cyrus W. Field with a considerable increment to the Garfield fund. If this idea prove popular, we shall be glad to acknowledge in these columns a full list, by name, of all the individual subscribers. This list, when completed—and to be effective it should be completed at once—ought to show the name of every telegraphic official, operator, lineman and messenger in the United States.

THE following is from the *World* of Sept. 16, a paper believed to speak for Mr. Jay Gould: "The ridiculous story of yesterday, relative to the sale of some of the company's (Western Union) assets, is said to have originated with a horse jockey who used to be a director of the company, and who seeks this means of revenge for having been given to understand that as a director he was neither useful nor ornamental. In plain English he was told that his room would be better than his company." Who can it refer to, anyway?

THE report of Western Union finances, made last month, looking at the revised figures as compared with the estimates made June 8, shows that they will have to do a tremendous business this fall to keep the actual net receipts anywhere close to the present estimates. According to the figures, that 1½ per cent. dividend was a close shave, but it is a dividend nevertheless, and we wish them much luck in earning more.

It is stated, upon the authority of the Western Union, that the earnings of that company have been for two months of the present quarter at the rate of 10 per cent. a year, and for the whole quarter will exceed probably the rate of nine per cent. a year. Should this prove true, there would be nothing inconsistent in a number of

underpaid and overworked operators respectfully asking for an increase of salary.

WHETHER it is owing to the enormous increase in the business, or to the introduction of so much superior American Union talent, is not easy to determine; but the fact of the matter is that for some time the number of errors in addresses, transpositions elsewhere, and general mutilation everywhere, has become astonishing and almost beyond belief. A halt, and then a retrograde movement in this respect, would prove beneficial.

THERE was what may be fairly called "enterprise" in the action of the *New York Herald*, which, when one of its specials was delayed at Sioux City, on account of the rush of business, offered to bear the expense of forwarding operators to that place from Milwaukee.

#### Exhibits at the Telephone Convention.

One of the most interesting features of the conventions of the National Telephone Exchange Association are the exhibits of the different manufacturers of electrical instruments and supplies.

The convention lately in session at Saratoga was no exception to this rule, and many valuable and useful articles of telephonic apparatus were shown.

The following firms made exhibits:

The Gilliland Electric Mfg Company, Indianapolis.

A. G. Day, New York.

Utica Fire Alarm Telegraph Co., Utica, N. Y.

Chas. Williams, Jr., Boston.

The Western Electrical Manufacturing Co., New York and Chicago.

Eugene F. Phillips, Providence, R. I.

The Washburn & Moen Manufacturing Co., Worcester, Mass.

The Electric Supply Co., New York.

Davis & Watts, Baltimore.

Post & Co., Cincinnati, O.

J. S. Ross, of Nashville, Tenn.

Law Telegraph Co., New York.

A. M. Young, Waterbury, Conn.

Other manufacturers and firms were represented, but did not exhibit.

The Electrical Supply Co., present by its agent, Mr. Theo. Mace, showed samples of lead protected electrical cables, the conductors of which were insulated by a fire-proof compound.

A. G. Day, of New York, the well-known kerite cable and wire manufacturer, was represented by General Agent Hotchkiss, and showed as samples some very fine specimens of armored cable, kerite-covered wires, anti-induction cables and kerite tape for covering wire joints.

The Washburn & Moen Manufacturing Company was ably represented by Mr. Henry M. Smith, and had a case upon exhibition showing the iron they use in various stages of its manufacture into wire, as well as its appearance after fracture.

Mr. Smith also distributed a number of copies of the "Pocket Handbook of Telegraph and Telephone Wire," which contains more solid meat and useful knowledge to the square inch than any book we know of.

Eugene F. Phillips, of Providence, so well and favorably known by all telephone men, was, as usual, promptly on hand, and exhibited many samples of aerial, underground and elevator cables, cordage and a large collection of cotton and silk covered office and magnet wires, together with the sample wire cards which are known as describing the Phillips wire "where'er the sun doth his successive journeys run." Mr. Phillips also had, for general distribution, a large number of small catalogues in pamphlet form, which contained so much valuable information

that they were almost worth their weight in German silver.

The Law Telegraph Company of New York had their new switch-board and system in good working order. It was inspected by all with vivid interest, and was conceded to be a system uniting great speed in connection with a minimum of space occupied.

In the board exhibited, which consisted of a table about two feet square, the top of which was covered with brass connection strips, arrangements were made for four operators, one on each side. The lines each terminated in a weighted cord and plug, the cord being connected by a spring to the line terminal. Upon receiving a call by the telephone, which is always in circuit on a call wire, all there is to do is to take the two plugs of the two lines and connect them to one strip, touching them both before connection to a battery strip, thus giving the signal to both parties at once.

Messrs. Post & Co., of Cincinnati, showed a large supply of apparatus, all of which was sold upon the spot. They had two 50-line standard plug switch-boards, one of which was furnished with foot-power and the other with hand-power for operating the magneto generator.

A battery pole-changer was shown, and a handsome supply of bells and other calling apparatus, fitted with novel and useful appliances; one bell, for example, was fitted with an automatic switch, which was arranged so as to receive with equal ease and be operated by either a Bell telephone or a pony crown.

This firm is justly noted for the excellence of the finish that their manufactures receive. They have made a new departure in several of their bells, in the way of ebony finish, and a number of fine samples of this character were on exhibition.

Chas. Williams, Jr., of Boston, one of the best-known manufacturers of telephonic apparatus in the world, showed several switch-boards and a variety of magneto bells of standard, skeleton and desk form. The exhibit of Mr. Williams was remarkable for its substantial form and character and for its strict regard to utility.

One of the switch-boards exhibited was a somewhat singular and unique piece of apparatus, covered with push buttons of various colors. Each perpendicular row represented one circuit, and to connect any two circuits together it was only necessary to press any button on both of the lines, taking care that the two pressed were both upon the same horizontal line.

The buttons were so arranged that when any button is already pressed, no other on the same line could be pressed without causing the first to spring up. This was only exhibited as a novelty, as it has not yet been introduced into practice. The other switch-board was of the regular Williams spring-switch pattern, and is usually regarded as the best board of its class.

Prominent in the rank of exhibitors was the Utica Fire Alarm Telegraph Company. This firm, though a new comer, is an ambitious one, and, if enterprise guarantees success, will surely attain it. They were alone in the exhibition of an unusually fine collection of novel small wares and specialties in tools. Fine grades of plyers and screw-drivers, of several sizes and performing special functions, were to be seen in their case, while wires of every imaginable grade, color and size gave a lively appearance to the exhibit.

The chief articles exhibited by this firm were, however, a pair of Combination Dial switch-boards. In these boards the line wires each run to the axle of a small crank or switch button, which may be rotated round its centre, and which may be caused to make contact, at the will of the operator, with any one of a series of studs, composing a kind of dial, which are connected by wires, each stud with its corresponding stud on the other dials. At the centre of the board is another and larger dial, by which the attendant throws his supervising instruments into and out of circuit with any pair of connected lines.

The Western Electric Manufacturing Co., of Chicago and New York, showed many interesting pieces of apparatus, among which were observed two 50-wire sections of the Western Electric central office switch-board, including shutter drops, jackknife switches and spring jacks, and having its cords fitted with pulleys and weights to restore them to their normal position when the plugs are released from the connection strips.

Different patterns of magneto bells were shown, and a conspicuous feature in the exhibit was the police signal box of the Chicago municipal system.

Many samples of covered and line wire were exhibited by this well-known firm, as was also an anti-induction cable, consisting of a number of insulated wires inclosed in a leaden or other covering, while through the centre of the group of wires is run a bare copper wire, which, when the cable is in operation, is connected to another wire that is not included in the cable. This method is claimed to be a perfect antidote for inductive disturbances.

This company also had upon exhibition a section of the so-called duplicate switch-board, in which, when used, all the wires entering the office are led to each section of the board.

The exhibit of the Gilliland Electric Manufacturing Co., Indianapolis, comprised magnetobells of several varieties, including Nos. 1 and 2 ordinary bells, extension bells, and a beautiful and ornate drawing-room set, including desk, battery box, drawer and base-board; while on the base-board wires are arranged for the bell and transmitter. These sets are made to order, in walnut, oak or mahogany.

This firm also showed some unique skeleton vibrating bells, having a circular metallic frame; Law Telegraph combination sets for exchanges using that system, and two complete central office switch-boards—one for 20 circuits and one for 10 circuits—each provided with lightning arresters, bells, switch bars for connecting any two circuits together, signaling annunciators for each line, desk and batteries.

These sets are intended principally for social purposes, or institutions, and are very convenient, as every possible wire is already run, leaving very little work to be done by the operating party.

A noticeable feature of this exhibit was a magneto bell, which, when its crank was turned, gave forth the melodious strains of a music box. This excited much comment, and was evidently by many regarded as a triumph of mechanical art.

The Gilliland Company has ever proved itself to be in the forefront of telephonic enterprise, and prides itself upon being always a little ahead of the times.

Messrs. Davis and Watts, of Baltimore, showed a six-circuit pin switch with annunciators and lightning arresters.

They had some notable samples of magneto bells having an automatic shunt and a certificate attached to each showing that the bells had been running by power constantly since April 15, 1881; had made 240,000 revolutions per day, thus making a total number of revolutions of 27,000,000, and that during that time they were not touched except to oil.

In connection with the apparatus of Davis and Watts, Mr. James Stabler, of Washington, D. C., exhibited the operation of his individual bell system.

In this system the armature of each bell is magnetized and vibrates between a pair of electro magnets. A wheel controlled by this armature operates a pointer over a dial. The bells are operated by successive steps of the armature and ratchet wheel under the influence of a pole-changing key. Only one bell magnet can be in the circuit at a time. When the desired bell is reached, the magnet of that bell is in circuit, the other bell magnets being shunted out. Then the battery is increased, causing the bell to ring.

This is the first individual bell showing the application of alternating currents operating a step-by-step movement.

Two other individual bell systems were exhibited, both of which were based on the principle proposed originally by Mr. Francis Blake, namely, a series of magneto bells, all originally out of circuit, but automatically cut in one after another, and apparatus whereby at the moment any one is cut in the signal may be given.

One of these was the invention of Mr. Ross of Nashville, by whom it was exhibited. It consists of a series of clocks. The clocks are started by turning a magneto machine in one direction. When that point is reached where the desired bell is in circuit, the crank of the magneto machine is turned in the other direction, and the clocks are all stopped and the signal is given at the desired point.

The other system shown is patented by Mr. L.

S. White, of Waterbury, Conn., and was exhibited by Mr. A. M. Young, who is, we understand, in part proprietor of the patent. In this system, also, the bell magnets at each station are cut out, but are alternately cut in by a battery current operated by a rapid step-by-step transmitter. When the proper bell is reached, the current may be either increased or reversed, and thus caused to ring the bell loudly.

## Notes and Queries on Electricity and Electromagnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 155. When the distance between the poles varies, by what rule can the proper dip be ascertained, in order to maintain the wire at the same distance from the ground at the lowest point of each span?

A. The dip of any span of wire—that is, the actual perpendicular distance from the highest point of the span to the lowest—varies, not in proportion to the distance between one pole and the next, but with the square of that distance.

It adds much to the symmetrical appearance of a line, to say nothing of its superior operation, when the tension is made uniform from pole to pole, all through the line; and this may be secured by remembering the simple statement given in last answer. We have already seen that 24 inches in a hundred yards may be taken as a standard, and we now see from the foregoing observations that the formula for finding any required dip must be: That the square of 100 bears the same proportion to the square of the length of the span under consideration as 24 does to the dip required in inches.

If, then, we wish from this to ascertain the height of the supports on the poles, so as to keep the dip between the spans a uniform distance from the ground, all we have to do is to add the amount of dip, which we have ascertained, to the distance which we have decided upon as the distance from the lowest point of each span to the ground, which gives as a result the height of pole support required.

To reduce these rules to practice, we illustrate by the following examples: We have a line, and the majority of the poles are 100 yards apart. Some spans, however, are, from circumstances over which we have no control, 150 yards long, and one 200 yards long.

It is required to find the proper dip that should be allowed in the longer spans, so as to keep the wire at an even distance of 25 feet from the ground, at the lowest point of each span.

We do this as follows, keeping in mind the above formula: Finding that the square of 100 is 10,000, and that the square of 150 is 22,500, by simple proportion it is readily ascertained that 10,000 is to 22,500 as 24 is to 54 inches, or 4 feet and 6 inches. This, therefore, is the requisite dip for a span 150 yards long. Now, to find the height at which this span should be supported at the poles, all we need do is to add the 25 feet that we have stipulated for as the lowest point of the dip to the dip itself—25 feet added to 4 feet 6 inches gives a height of 29 feet 6 inches, which must be the height of the insulator from the ground.

We now consider the span of 200 feet long, and proceed as before. The square of 100, that is 10,000, bears the same proportion to the square of 200, or 40,000, as 24 bears to 96 inches, or 8 feet. Eight feet, therefore, must be allowed in this case, and the supports made 33 feet from the ground. In these remarks it is not to be understood that an arbitrary standard of 24 inches dip in 100 yards is insisted upon; but, having already decided upon a standard dip, it is desired to show how to maintain that dip uniform.

Q. 156. What is the cause of the humming noise often heard where wires are attached, and how may it be prevented?

A. This noise, which is frequently so loud as to be very annoying, especially to the inmates of houses over which the wires are run, is caused by the vibration of the wires under the influence of the wind, in the manner of an *Æolian harp*.

It may be prevented in the following way: Two pieces of stout india rubber tube, like that used for covering the rollers of wringing machines, are cut about two inches long, and one is fastened at each end of a piece of line wire, four

or five feet long, by passing the wire through it and twisting it back on itself. This piece of wire is then fastened at its centre to the insulator, as usual, by a tie wire.

The line wire is then cut and an end fastened to each of the sections of hose, by passing it round the outside of the piece of hose, and twisting. To preserve the continuity of the line, a small iron or copper wire is then connected and soldered to the two ends of the line beyond the rubber. The insertion of a piece of small chain in the line, surrounded the same way by a continuity-preserving small wire, is also sometimes successfully adopted. Other remedies, all tending to the same end, are occasionally employed, the main object in each case being to prevent the vibration by interposing a damper.

Q. 157. Are aerial wires ever carried in cables?

A. Yes; it is frequently found desirable to run a number of wires over the same route for a short distance, while the available space is circumscribed. This plan is then found very effectual, and is adopted by several of the local city companies in America. It will be more universally employed in the future, as the number of wires, owing to the rapid growth of the telephone systems, is daily increasing, and has already become a nuisance, both to the companies owning the wires and to the public.

In London cables containing as many as fifty insulated wires are suspended by frequent hooks from No. 8 wires. Although the insulation of these wires is often not first-class, yet it is sufficiently good for short lines.

Q. 158. Does the resistance of wire vary with the temperature?

A. Yes; the resistance of all wires increases with increased temperature, and the resistance of nearly all metals increases at the same rate, iron and thalline, according to Dr. Matthiesen, being the only exceptions. From the tables given by Latimer Clark, we learn that the resistance of iron wire increases about 35 per cent. for each degree Fahrenheit, and that the resistance of copper increases as the temperature rises 21 per cent. for each degree.

It is also ascertained in the resistances, which increase with increased temperatures. The rate of increase is not reckoned all through on the original resistance, but is, as it were, computed in the same manner as compound interest on a sum of money. For example, if we have a wire which measures 100 ohms at 60° Fahrenheit, and the resistance be increased by a certain amount by a rise of one degree in temperature, it will be increased by the next degree of rise at the same rate per cent., calculated on the original resistance, plus the amount increased by the first degree of rise.

#### A Timely Proposal.

To the Editor of The Operator:

SIR: The men in this office would very much like to express their regard for and sympathy with Mrs. Garfield in her great affliction. As there are a great many telegraphers in the United States who are undoubtedly of the same mind, I am requested to ask you if you cannot start, through THE OPERATOR, a subscription to be known as the "Telegraphers' 25-cent Garfield Fund," undertaking to receive and acknowledge contributions yourself. This amount is small, but will make quite a large sum when all subscriptions are in. Please consider the matter and let us hear from you, either through THE OPERATOR or by mail.

J. M. CRONENBERG,  
W. U. Tel. Office.

TOLEDO, O., Sept. 22, 1881.

#### A Caustic Retort from Worcester.

To the Editor of The Operator:

SIR: In your last issue I see a communication dated Worcester, which is so wide of the truth that a few lines of correction seem called for. Either "N." is very "new" in the business, or the gold plate at Springfield had such a dazzling effect on his eyesight that he can see no good in anything which does not have that peculiar glitter. The old Western Union switch he speaks of as being in use here exists only in his extraor-

dinary vision. The switch referred to was made to order about one year ago, expressly for the Worcester office, and is considered an excellent one. It has 200 circuits, on which there are now upward of 700 subscribers, and new ones are being added at the rate of 10 to 15 per month. The office answers, on an average, about 4,000 calls per day, and the odd attachments spoken of are something we have never discovered here and must have been purely imaginary. The large number of subscribers and the constant increase of the same in a city of less than 60,000 inhabitants, is assurance enough to the management that their efforts are rewarded with a very good degree of success. As to the muchness spoken, whatever that may be, I think the stockholders of a good many exchanges would be pleased to catch on to it, provided their dividends came along as surely as do those from the Worcester Exchange. It is not impossible but "N." might spend a day to advantage in Worcester, if he contemplates entering the business.

D.  
WORCESTER, Mass., Sept. 20, 1881.

#### DASHES HERE AND THERE.

The American District Telegraph Company's boys struck for higher wages in Chicago last Monday week, but were unsuccessful.

Messrs. Presbury & Hildreth, the proprietors of the West End Hotel, Long Branch, gave a farewell banquet to the newspaper correspondents and telegraphers on the 21st ult.

Complaint is now made that the electric light is bad for the eyesight, and that people obliged to work for hours continuously by this light—such as salesmen and clerks—are having their eyesight gradually destroyed thereby.

A telegraph line is now being built in Siam. It is thought that the line can be constructed in a few months, after the close of the rainy season, and that Bangkok will be in communication with the outside world before the first of next February.

A great clothing house at Paris exhibits several sewing machines which move by electricity with wonderful speed and regularity. The establishment uses them for its own sewing, and thereby greatly lightens the task of the hard-worked seamstresses.

The handsome offer made by the Saxon Importing Co. in their advertisement, on another page, simply to introduce a new gun, is one of the greatest bargains in fire-arms. They actually offer a first-class breech-loading shot-gun for \$5.50. Many thousand of these guns are already in use in Europe, and they are said to give great satisfaction.

Fifty gold, 200 silver and 500 bronze medals and diplomas have been placed at the disposal of the jurors of the International Electric Exhibition. The President of the jury, the reporters, and the secretaries will be French. Belgium, Germany, England, Italy and America will each have a vice-president.

Canada, with 35,000 miles of telegraph wires, has one telegraph office to every 2,430 persons. England has only one office to every 5,860 persons. For the whole world the average number of telegrams sent annually is one for every seven or eight persons. The number of telegrams per 1,000 inhabitants is about as follows: New Zealand, 2,394; Victoria, 809; Switzerland, 753; the United States, 730; Great Britain, 704; Belgium, 471; France, 387; Germany, 280; Greece, 196; Austria, 173; Spain, 89; Russia, 60; Cochin China, 9; the East Indies, 6.

The British Postmaster General's report gives the following statistics of telegraphers employed in the postal service, exclusive of 225 pensioners:

STAFF EMPLOYED EXCLUSIVELY ON TELEGRAPH DUTIES.			
Chief engineers and other superior officers	.....	11	
Clerks, telegraphists, etc.:	Male.	Female.	
London	2,033	904	
Provincial	3,031	652	
	5,064	1,556	
Messengers	.....	6,620	
		4,736	
		11,367	

All the materials required for the first section of the telegraph land lines in China, to be erected by the Great Northern Telegraph Company for account of the Chinese Government, have been gradually sent for some time since. The first

shipments have arrived, and the line is now being very expeditiously erected. Meanwhile, the Chinese authorities have thought it desirable that the line should be duplicated from the very beginning, and the Great Northern Telegraph Company are therefore now preparing to ship all the material required for that purpose.

At the Paris Electrical Exhibition, recently, an operative representation by telephone was given in the presence of M. Gambetta, Admiral Clouet and others. The performance came off in the two rooms set apart for the purpose on the first floor. The opera was "Robert le Diable." The sound of the singers' voices, transmitted from the Grand Opéra by telephone, was heard with the greatest distinctness, but the orchestral effects were reproduced very imperfectly. Nothing more beautiful could be imagined than the aspect of the palace with its myriad lights.

A lady at — Springs telegraphed her milliner at W. to send "Grenadines by first train." The operator at W. stuck on "Grenadines." After breaking until the sending operator left in disgust, he set to work to guess the missing word. The nearest he could come to it was Green Adkins, an old negro living near there. "Ha! I've got it," and down it goes. The message was delivered and Green Adkins started on first train for the Springs, where he was given a note for the Grenadines and sent back to W. The payment of Adkins' fare both ways settled it with the company, but it has not been entirely settled with the boys yet.

In the report presented by the Executive Committee of the W. U. Tel. Co. at the quarterly meeting of the Board held June 8, 1881, the net revenues for the quarter ending June 30 (May being partially and June wholly estimated) were stated at \$1,836,391. The official returns for the quarter (ended June 30) show the net revenues to be \$1,842,844.22 or \$6,453.22 more than the estimate. The net revenues for the quarter ending Sept. 30, based upon official returns for July nearly complete returns for August, and estimating the business for September, will be about \$1,949,894.61. As stated last issue, a quarterly dividend of 1½ per cent was declared.

Last year Mr. David Brooks, of Philadelphia, made a proposition to the postal telegraph authorities to lay an experimental line of his underground telegraph system between Waterloo and Nine Elms on the London & South-western Railway. It was to be paid for upon condition that it worked satisfactorily for a period of six months. Mr. Brooks also proposed to extend the system from Nine Elms to Clapham during the present year upon the same terms. Last spring he returned to England to carry out his second proposition, which had been accepted by the post office. The extension of the line from Nine Elms to Clapham has now been completed and promises to be as successful as the first experiment.

#### NEW YORK CITY ITEMS.

The New York Electrical Society will resume its meetings on Wednesday evening, Oct. 5.

The stock of the Northwestern Telegraph Company has been placed on the list of the New York Stock Exchange.

All the employés of the A. D. T. Co., below inspectors, wore crape on the left sleeve of their coats on the day of President Garfield's funeral.

At the annual meeting of the stockholders of the Gold and Stock Telegraph Company, Sept. 28, the following directors were elected to serve during the ensuing year: Messrs. Norvin Green, J. O. Green, T. R. Edson, James H. Banker, Augustus Shell, Jay Gould, William M. Bliss, E. D. Morgan, John Van Horn and T. T. Eckert. No statement of the finances of the company was made public.

#### PERSONAL.

The many friends of Mr. W. H. Stanton, of the St. Louis W. U. office, will regret to learn that his wife died in that city Sept. 14.

Mr. Frank L. Thirkield, of the Indianapolis (Ind.) W. U. office, has been appointed manager of the Baltimore (Md.) Mutual Union office.

Mr. J. W. Christie has been transferred from the Western Union office at Wilmington, Del., to their main office in Philadelphia.

Mr. James Merrihew, the popular and efficient superintendent, has been given temporary supervision over the main Western Union office in this city.

Mr. Charles Flinn, operator at Longview Junction, Tex., was married July 30, to Miss Smith, W. U. manager at Jacksonville, at the residence of the bride.

Mr. James Gamble, for ten years superintendent of the Western Union for the Pacific States, has been appointed General Manager of the Mutual Union.

Mr. George Kenney, a clerk in the employ of the American Union, at Philadelphia, was killed in a railroad smash-up on the Philadelphia & Reading Railroad, on the 22d ult.

Mr. Will. S. O'Brien, manager of the W. U. office at McGregor, Iowa, was in New York last week during his vacation, and did not forget to give THE OPERATOR office a call.

Mr. J. G. Carnachan, who filled the position of operator and way-bill clerk for the N. Y., P. & O. R. R. at Oil City, Pa., for several years, resigned Sept. 1, to accept a more lucrative position elsewhere.

Geo. Ferd. Webb, operator at Saccarappa, Me., died Sept. 19, after a long and painful illness, at the residence of his father. The funeral, which took place Sept. 21, was largely attended, the stores of the village being closed during the service.

After a lingering illness, Sarah J., wife of Jno. D. Voltz, of the Western Union office, Nashville, Tenn., died in that city Aug. 28. Mrs. Voltz was a most estimable lady, and her death is mourned by a large circle of friends. Her funeral took place from the Church of the Advent. Among the pall bearers were Manager Fisher, Night Chief Rust and J. H. Ford, of the Western Union.

BALTIMORE, MD.—The Mutual Union has secured the large office of the P. W. & B. R. R. Co., on Balto. street, and will open for general telegraph business about Nov. 1. Mr. C. C. Wolff, late chief operator of the W. U. main office, has been reduced to the ranks, and Mr. R. J. Bloxham promoted to Mr. Wolff's position, not Mr. Tracey, as was mentioned in THE OPERATOR of Sept. 15. A new electric light company will be started this month; G. F. West, Superintendent.

In recognition of his obliging and untiring efforts to keep the citizens of Meadville, Pa., informed of the fluctuations in the late President's condition, to accomplish which he had on several occasions to remain on duty beyond his regular time, Mr. E. M. Boynton, manager of the W. U. office at that place, was recently presented with a handsome autograph album and an elegant gold watch, chain and charm. As the Meadville Republican says: "It was a timely present to a worthy recipient."

The following compose the staff of the American Telegraph and Cable Company, at Canso; Mirror Side, Mr. Connor, C. C.; St. Pierre, Mr. Courteen; Land's End, Eng., Mr. MacLaine and Mr. Nash of St. Pierre. To arrive, Mr. J. Brown, Manager, and Mr. Gerrard. Morse Side, J. J. Burgess, C. C., North Sydney; B. B. Kay and C. H. Ward, New York; T. E. McDonald and B. B. Palmer, North Sydney; writers and checks, D. E. Blois Harrington, St. John, N. B.; M. Densmore and A. Coste, St. Pierre; D. Mackaracher, Tor Bay; Arthur Winterbotham and James Ward, South Sydney; Frank Hunter, Charlotte-town, and Arthur and Reg. Young, Canso.

NASHVILLE & ST. LOUIS.—Mr. L. Park is agent and operator at Decherd, ably assisted by his daughter. Miss Lena has the honor of being the only lady on the line, and the boys mentally tip their hats when they answer her call. G. H. Norton is agent and A. Y. Smith operator at Tullahoma; J. M. Bramblett agent and operator at Normandy, J. H. Holt at Wartrace, and J. M. Miller at Christiana. M. F. Jordan is at Murfreesboro; Wm. Ford, nights. J. R. Park is agent and operator at Lavergne; and last, but not least, either in the estimation of the boys or in weight, is our efficient dispatcher, Mr. W. P. Sweeney, who is assisted by A. Mack, with D. B. Carson assistant and extra man, and H. G.

Comstock, extra agent and operator. Charley Stewart holds the fort nights.

OSHKOSH, WIS.—A number of important changes have occurred in the commercial department of the W. U. Co. in Northern Wisconsin during the past month. At Appleton, the city office is now managed by Miss Belle Madison, who relieved A. H. Allen. At Fond du Lac, we find Mr. Ed. Lucas, manager; Mr. Sharpe, the former manager, having resigned to engage in other business. At Oshkosh, Arthur H. Allen, late manager at Appleton, succeeds H. D. Sloat, Mr. Sloat having retired from the profession to engage in the grocery business at New London. Oshkosh is the second city in the State, and the telegraph business at that point is increasing rapidly. Mr. Allen is assisted by H. D. Perry, a C. & N. W. Ry. operator, who hails from Wrightstown. The genial Tom Callahan is still at Neenah, Wis.

Mr. Dwight, the general manager of the consolidated companies of Canada, is given great credit for the way in which he has provided for the operators, giving employment to all Dominion operators wherever he can make arrangements to do so, and providing by other means for those that were "left." The agencies in most cases, however, are being given to the Montreal agents. Telegraph matters have been looking up of late in this "Canada of ours," and a greater boom than ever is expected this fall, so none need be idle. All the large offices have been transferred, and by the end of the present month it will be one affair. The office at Stratford, Ont., has just been consolidated. The following is the staff under the new management: Mr. W. N. Warburton, general manager and agent, and the following operators, "Tom" Bates (formerly of Peterboro and the Dominion here), A. W. Cassels (formerly Dominion), "Jim" Flynn and Herb. Mills.

We regret to have to announce the death of Miss Fannie E. Macdonald, which took place at the residence of her brother, at Camden, N. J., Sept. 13. She was buried on the 16th ult. at North Laurel Hill cemetery, Philadelphia. Miss Macdonald was well known and was a general favorite in the telegraphic profession. She learned and commenced telegraphing at Falls of Schuylkill, Philadelphia; was afterwards transferred to Kellyville, Penna., on the West Chester Railroad, and, after spending some years there, took charge of the Delaware avenue market office, Philadelphia. She was subsequently made operator at the executive office of the Lehigh Valley Railroad in Philadelphia, where her winning nature and undoubted ability earned her speedy promotion. She was then advanced to a clerkship in the Auditor's office of the same company, a position she held at the time of her death. Her untimely end has caused widespread sorrow among a large circle of telegraphers, for, in one so young and accomplished as Miss Macdonald, death was about the last affliction expected.

Mr. O. M. Chesney, of Topeka, Kan., writes to THE OPERATOR, complaining of very harsh treatment at the hands of the Texas & Pacific Railroad and H. C. Brown, "R. A.," of that company. He says he was sent to a desolate, sandy wilderness where there was only one house, and that a portable one, 8x10, with no other in miles, and no place to sleep or get anything to eat. He was compelled to remain without food from Sunday noon, Sept. 11, until the following Wednesday, the trainmen having forgotten to bring him what he ordered from the stores at end of the division. Several others were sent to the same place, being assured that there was "a nice little town" there, but not finding the alleged "town" they incontinently returned by the next train east. Mr. Chesney is now ill at Topeka from the effects of his treatment in Texas. He says that when he asked Mr. Brown, "R. A.," for his time, he found that pay for two days and one night had been given to the operator who had come down and gone right straight back, disgusted with the place, and this amount was deducted from Mr. Chesney's pay, because the other operator was gone long enough to have worked the time and Mr. Brown, "R. A.," had already paid the money, and could not make his reports right if he paid it again.

## BORN.

CREAMER.—Aug. 6, to J. Marion Creamer, operator W. U. Tel. Co., Baltimore, Md., a daughter.

CUNNINGHAM.—To C. B. Cunningham, manager W. U. Tel. office, Longview, Tex., a son.

WOODING.—Sept. 22, 1881, to Mr. Howard W. Wooding, operator private line, Middletown, Conn., a daughter.

## MARRIED.

REICHENBACH—BOERINGER.—Sept. 20, 1881, at the residence of the groom, in St. Louis, Mr. J. J. Reichenbach, formerly of the Cairo & St. Louis Railway, to Miss Lizzie Boeringer, of Hermann, Mo.

## DIED.

UPPERMAN.—At Deer Park, Md., Sept. 15, 1881, Lester Fred, aged 16 months, only child of William B. and Minnie A. Upperman.

MACDONALD.—Suddenly, on the 13th ult., at Camden, N. J., Fannie E. Macdonald.

The Blanchard Foods.

**FOOD CURE**  
TRADE MARK  
(Concentrated and Artificially Digested.)  
A SURE NATURAL REMEDY  
For all forms of **DYSPEPTIC, WASTING**  
and **CHRONIC DISEASE.**  
Circulars free on application.

**FOODS For the BLOOD, BRAIN AND NERVES**

THESE ARE LIQUID **FOODS,** PREPARED DIRECTLY FROM **Wheat, Beef, Milk.**

DR. BLANCHARD'S "Lectures and Essays" on Food, Price 25 cents. ALL DRUGGISTS.  
Address THE BLANCHARD MFG CO., 27 UNION SQUARE, N. Y.

DR. BLANCHARD CONSULTED FREE, IF POSTAGE IS PREPAID.

**The Tonic Extract of Wheat** improves weak digestion, cures sleeplessness, nervousness, constipation, loss of appetite and power. Especially adapted to repair brain waste from study, care or grief. Prevents and cures Bright's disease, diabetes, uterine weaknesses, rheumatism, neuralgia and all malarial diseases. Strengthens to overcome evil habits. Adapted for table use. \$1 each, or six bottles for \$5. Sample bottle 50c.

**The Fibrin and Wheat** restores the confirmed dyspeptic stomach and cures all forms of long standing nervous debility. Vitalizes weakly children and energizes old age. Sure preventive and cure for diphtheria, infantile diarrhoea and cholera infantum. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Beef and Milk** is for a very weak condition, and never fails to assimilate, however weak and irritable the stomach. Invaluable for nursing mothers. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Life Food** is to be taken between meals to relieve sense of "goneness." Never failing remedy for the alcohol, opium and tobacco habit, and for insanity and cancer in their early stages. \$1.50 each, or 6 bottles for \$7.50. Sample bottle 75c.

# GILLILAND ELECTRIC MANUFACTURING CO.,

E. T. GILLILAND, General Manager, INDIANAPOLIS, Ind.

**TANDARD**  
**Magneto Bell.**

37,000 now in use.

no further attention is required until desired to talk in the opposite direction. When the Telephone is hung up, the line is restored for the use of others upon the same circuit, the Indicator simply governing the talking. Additional to the superiorities it possesses as a Secrecy Switch, it has an excellent feature in that all of our Bells can be converted from a Gravity to a Secrecy Switch, or vice versa, and provide for the possibilities of the Individual Bell in the future.

**SECRECY SWITCH.**  
**STANDARD MAGNETO.**

This Secrecy Switch has many advantages over the old style. It can be attached to any or all of our Magneto Bells by a change in the connections and the addition of the Indicator, for in their construction this change was provided for. In all the Secrecy Switches heretofore made, it was necessary to turn the switch every time it was used, but with this latest improved, the Gravity Switch is employed. The Indicator controls the talking, and when set for the Exchange, no further attention is required until desired to talk in the opposite direction. When the Telephone is hung up, the line is restored for the use of others upon the same circuit, the Indicator simply governing the talking.

Additional to the superiorities it possesses as a Secrecy Switch, it has an excellent feature in that all of our Bells can be converted from a Gravity to a Secrecy Switch, or vice versa, and provide for the possibilities of the Individual Bell in the future.

TEN-LINE COMBINATION SWITCH BOARD.

## 10-LINE and 20-LINE SWITCH BOARDS,

For the club system of small towns and villages.

INVALUABLE FOR

State and County Institutions, Hospitals, Factories, Depots, Offices, Stores, etc.

Being complete, compact and handsome

our COMBINATION SWITCH BOARDS are universally used: the demand is extraordinary and continuous, giving satisfaction in every particular.

## 50, 100-Line & Upward SWITCH BOARDS

FOR EXCHANGES.

Over 1,200 of our Switch Boards in use in this country and in Europe.

## SUPPLIES OF ALL KINDS.

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY

J. H. BUNNELL & CO.,

112

LIBERTY STREET,

New York.

BEST IN THE  
WORLD.

PATENTED Feb. 15  
1881.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking* is *absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert, or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.  
LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of U. S. or Canada on receipt of the above price, by registered letter or money order.

**A \$ 15.00 BREECH LOADING SHOT GUN FOR \$5.50**  
**WEIGHT 6½ lbs. LENGTH 4 ft.**

**THE SAXON BREECH LOADER**

**ONLY \$5.50**

### THE SAXON BREECH-LOADING SHOT GUNS

Having been extensively introduced in ENGLAND and FRANCE, where they have given universal satisfaction; and, wishing to introduce them in the United States, we have concluded to sell a LIMITED NUMBER of this matchless weapon at a price which brings them within the reach of every one.

The SAXON BREECH-LOADER has a Blued Barrel, thoroughly tested, guaranteed perfectly safe and accurate, case hardened, handsome stock, and every part of it made of the very best material. Length 4 feet; weight 6 1-2 pounds. The improved patent breech makes it far superior to, and less liable to get out of order than any other breech-loading Shot Gun in the world.

Upon receipt of \$5.50, and the attached Certificate, before March 1st, 1882, we will ship the above Gun to any address in the United States.

**CUT THIS CERTIFICATE OUT.—IT IS VALUABLE.**

Upon receipt of this Certificate, before March 1st, 1882, with \$5.50, we hereby agree to forward to any address in the U. S., one of our Saxon Breech-Loading Shot Guns, and guarantee it in every particular.

**SAXON IMPORTING CO.**

**CUT THIS CERTIFICATE OUT.—IT IS VALUABLE.**

The above offer is only made to introduce this incomparable gun in this country. To protect ourselves from dealers ordering in large quantities, we have concluded to insert this Advertisement, one time only, in this paper, hence require you to cut out the above certificate and enclose it to us with your order. We will not sell more than one gun to the same person, at the above price, and not then unless the order is accompanied by the above certificate. Our regular price is \$15.00, and that amount will be charged unless order is accompanied by Certificate. In no case will we send more than one gun with each Certificate. If you do not wish a gun for your own use, you will have no trouble in disposing of it at a handsome profit. In selling samples of the "SAXON" at \$5.50 each, we are making an ENORMOUS SACRIFICE, but we feel sure that one gun going into a neighborhood will sell ten more at our regular price. We wish to caution you against persons offering guns in imitation of the SAXON, to ascertain if the gun is genuine, see that the word "Saxon" is stamped on it. The sporting papers generally, join in praising THE SAXON BREECH-LOADING SHOT GUN as being one of the most reliable Sporting Guns in the world. REMEMBER, this is a SPECIAL OFFER, and will not appear again, as we wish to introduce the SAXON BREECH-LOADER in America as soon as possible. We guarantee this Gun to be exactly as represented, and will return the money if they are found to be otherwise. Should you desire it, we will send the gun C. O. D., (with the privilege of examination) on receipt of \$2.00, to guarantee us against loss by Express charges. If we are strangers to you we refer you to any Bank or Express Office in New York City. For \$1.00 extra we will send with the Gun, one of Our New Sportsman's Cartridge Belts and 50 Metallic Base Reloadable Shells. If you have friends in New York have them call and see us. Send money at our risk by P. O. Money Order, Registered Letter, or Bank Draft payable to our order. Address,

**SAXON IMPORTING CO., 116 Chambers St., New York City.**

## THE DELANY RELAY AND SOUNDER.

**RELAY.**

**SOUNDER.**

The above cuts illustrate the Delany Patent Telegraph Relay and Sounder, now being manufactured and tested with a view to their general introduction on all Telegraph Lines liable to be affected by the Page Patent. These instruments are in all respects superior to any now in use.

Railroad companies and others desiring instruments for trial should apply to

**THE DELANY PATENT RELAY COMPANY,**  
**61 BROADWAY, NEW YORK**

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00

The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75

The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

**SIMPLICITY AND EFFICIENCY**

### In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

#### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.  
And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

40 West 18th St., New York.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

**A. B. LYMAN,**

**36 SOUTH WATER STREET,**

**CLEVELAND, O.**

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

**PATENT APPLIED FOR.**

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.

2d. The cells are all exactly alike.

3d. They continue exactly alike.

4th. They never get out of order.

5th. The first cost is less than any other.

6th. The connections NEVER corrode.

7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.

8th. The water cannot evaporate.

9th. The sal ammoniac cannot escape.

10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

**PRICE, \$1.25 PER CELL.**

TELEGRAPHIC SPECIALTIES.**

**THE "LATTIG" [AUXILIARY LEVER NON-STICKING] KEY.**

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very *finely finished*, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the *indorsement of the best operators* in the country. It embodies the only true principle to *prevent a key from sticking*, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of *sticking keys*. We claim this key will never fail to make contact.

**"THE EXCELSIOR KEY."**

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY OF BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

**The Giant Sounder Perfected.**

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

**Champion Lightning Arrester.**

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

**Premium Learners' Apparatus.**

**ONLY \$5.00.**

**Not the Cheapest, but Guaranteed the Best!**

The PREMIUM LEARNERS' APPARATUS AND OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

### Western Union Annual Report.

The annual meeting of the Western Union Telegraph Company was held in this city on Wednesday last, Oct. 12. Over 60,000 shares of stock were voted upon. Some comment was occasioned in Wall street and telegraphic circles by the fact that the election was unanimous, and that the new board of directors contains the names of several persons generally supposed not to be on very friendly terms with Jay Gould. The following is a list of the new directors, the first twenty being re-elected and the last nine new members:

Norvin Green, Thomas T. Eckert, Edwin D. Morgan, John Van Horne, Augustus Schell, Harrison Durkee, Jay Gould, Russell Sage, Alonzo B. Cornell, Sidney Dillon, Cyrus W. Field, Edwards S. Sanford, James H. Banker, Moses Taylor, Robert Lenox Kennedy, Hugh J. Jewett, J. Pierpont Morgan, Frederick L. Ames, Edwin D. Worcester, William D. Bishop, C. P. Huntington, George P. Roberts, Zalmon G. Simmons, Samuel Sloan, Erastus Wiman, Amasa Stone, George J. Gould, Chauncey M. Depew, James W. Clendenin.

It was thought by some that Dr. Green would retire from the Presidency of the company at the present election, and be succeeded by General Eckert. The directors, however, held a meeting immediately after the adjournment of the shareholders' meeting and re-elected the following officers for the ensuing year:

President, Norvin Green; Vice-Presidents: Thomas T. Eckert, John Van Horne, Augustus Schell, Harrison Durkee; Secretary, A. R. Brewer. The Executive Committee is as follows: Norvin Green, Thomas T. Eckert, Edwin D. Morgan, John Van Horne, Augustus Schell, Harrison Durkee, Jay Gould, Russell Sage, Alonzo B. Cornell, Sidney Dillon and Cyrus W. Field. The only new member of the committee is Cyrus W. Field.

In his annual report President Green says:

#### THE INCREASE IN CAPITAL STOCK.

The capital stock of the company is \$80,000,000, it having been increased during the year from \$41,073,410, by the issue of \$38,926,590, as follows: \$15,526,590, to the stockholders of the company existing previous to said increase, for that amount of net profits earned by the company since July 1, 1866, which has been applied to the acquisition of new telegraph property, instead of being paid to them in cash dividends; \$15,000,000 for the \$10,000,000 capital stock and \$5,000,000 bonds of the American Union Telegraph Company, at par, and \$8,400,000 for the \$14,000,000 capital stock of the Atlantic and Pacific Telegraph Company, at 60 per cent. Of the capital stock, there is owned by and in the treasury of the company \$20,017.

#### BONDED DEBT.

The bonded debt at the close of the year was as follows:

Bonds due March 1, 1900, 6 per cent.	\$951,102
Bonds due May 1, 1900, 7 per cent.	3,920,000
Bonds due May 1, 1902, 7 per cent.	1,373,000

	\$6,244,102
Less balance of sinking funds appropriations, not yet used for redemption of bonds, held by the Union Trust Company, trustees.	190,855

\$6,053,246

During the year £2,100 of the (sterling) bonds, due March 1, 1900, were redeemed by the trustees of the sinking fund.

#### BUSINESS OF THE YEAR.

Surplus July 1, 1880.	\$403,255
The revenues, expenses and profits of the year ending June 30, 1881, were as follows:	

Revenues.	\$14,060,806
Expenses (including leased line rentals and taxes).	8,420,165
Net profits.	5,640,640

Total. \$6,043,895

From which there was applied:

For dividends.	3,732,633
For interest on bonds.	427,455
For sinking fund appropriations.	40,005

Total. \$4,200,094

Surplus of net revenue for the year, over dividends, interest and sinking fund appropriations, was.	\$1,440,546
---	-------------

For new property there was appropriated:

For construction of new lines and erection of additional wires.	\$1,041,657
For telegraph stocks and other properties.	674,884

	\$1,716,542
Surplus July 1, 1881.	127,258

\$6,043,895

During more than half of the year for which this statement is made, the company's expenses were largely increased and revenues somewhat diminished by a sharp and litigious competition, and by maintaining the separate organization of the Atlantic and Pacific Telegraph Company under the then existing agreements; and during the latter half, much of the duplicate expenditures for rents, etc., besides extraordinary legal expenditures, had to be borne. The net revenues of the company for fifteen years, including surplus of income account July 1, 1866, (\$275,357) aggregated \$51,266,238. During this period there was paid in cash dividends to the stockholders (including dividend of July 15, 1881) the sum of \$23,533,927.

Summarizing the general statement in round figures, Dr. Green continues, it appears that of the fifty-one and a quarter millions of net profits accruing to the company during the past fifteen years, over twenty-six and three-quarter millions have been paid to stockholders in cash dividends, over seventeen and a quarter millions in stock dividends, six millions for interest and sinking fund on bonded debt, leaving a present surplus unappropriated of one million and ninety thousand dollars.

The business of the year ending June 30 has been exceedingly gratifying. \* \* \* \* \* The revenues have been larger than anticipated, but it has been a year of continued warfare and

legal controversies, involving very considerable expenditures, affecting the net results. It was really near the close of the year before the benefits and economies of the consolidation of the lines of the three companies were fully realized. For the quarter which has expired since the end of the fiscal year for which this report is made, a large increase of net profits is shown, indicating very much better results for the ensuing year.

The Western Union, among other assets, at present owns of the Gold and Stock Tel. Co.'s stock 18,905 shares, valued at \$1,176,009; International Ocean, 15,170 shares. 961,666; Brooks Underground Tel. Co., 1,000 shares. 95,000; Southern Bell Telephone & Telegraph Co., 1,687 84,325; Western Electric Mfg. Co., 1,000 shares. 50,000

After referring to the absorption of the Northwestern, Montreal and Dominion Telegraph Companies, the report goes on:

#### GOLD AND STOCK TELEGRAPH COMPANY.

The capital stock of the Gold and Stock Telegraph Company is \$5,000,000, of which the Western Union Telegraph Company owns \$1,890,500, and the company itself owns \$105,600. Its bonded debt, maturing May 1, 1885, is \$500,000, of which \$65,000 is owned by the company.

Its net profits for the year ending June 30, 1881, were \$412,422.19. During the year there were paid for quarterly dividends, \$200,000; for interest on bonded debt, \$35,000; for construction of lines and purchase of patents, \$70,000. The surplus of the year, of \$107,500, has been invested in telephone stocks.

The earnings of the company for the year were upwards of 7½ per cent. on its present capital stock, above its interest account.

The Gold and Stock Telegraph Company has large and valuable assets in stocks of other telegraph and telephone companies, all of which have been purchased out of the previous profits of the company. Most of these are now paying handsome dividends. Two of them—the American Speaking Telephone Company and the Metropolitan Telephone and Telegraph Company, which have been otherwise applying their revenues—are expected to commence paying dividends the ensuing year at a rate not less than 8 per cent. per annum. Such assets are as follows:

Name.	Portion of cap. stock owned by G. & S. T. Co.	Whole amt. of capital stock.	Rates of dividends now being paid.
Phila. Local Tel. Co.	\$300,000	\$400,000	10 per cent.
Central Dist. & Printing Tel. Co. (Pittsburgh)	82,666	500,000	6 "
Gold & Stock Tel. Co., of California.	287,500	600,000	9 "
Telephone & Tel. Co., of Michigan.	95,100	250,000	8 "
Bell Telephone Co., of Philadelphia.	125,000	560,000	12 "
American Speaking Telephone Co.	1,200,000	1,800,000	
Met. Telephone & Telegraph Co.	400,000	1,000,000	
	\$2,490,266		

#### INTERNATIONAL OCEAN TELEGRAPH COMPANY.

The capital stock of the International Ocean Telegraph Company is \$3,000,000, of which the Western Union Telegraph Company owns \$1,517,-

000, and the company itself owns \$194,600. It has no debt.

Its net profits for the year ending June 30, 1881, were \$229,252.66. During the year there was paid for quarterly dividends, \$196,378, and for construction and other new property, \$5,873.94, leaving the cash surplus at the close of the year, \$152,744.04, or \$27,000.72 greater than it was at the close of the previous year.

The company is now earning and paying at the rate of 8 per cent. per annum on its present capital.

#### ESTIMATE FOR THE ENSUING YEAR.

The gross earnings of the Western Union Telegraph Company for the ensuing year cannot be less than fifteen millions, and the net profits can scarcely fall below six and a half millions. The earnings are now, and have been for the first quarter just closed, at a rate considerably above the figures named. Respectfully submitted,

NORVIN GREEN, President.

#### Progress of the Paris Electrical Exhibition.

[Special Correspondence of The Operator.]

The sad news from America has thrown a gloom over the entire exhibition, naturally deepest about the American section, which has been heavily draped in mourning out of respect to the memory of our dead President. The English and Belgian sections also express their sympathy by drapery, while from all sides come messages and expressions of condolence, showing how deeply interested foreign countries are in our affairs. On Monday, the 26th, the American exhibits were closed up, a privilege that has not been accorded on any other occasion.

The jurors have finally been appointed by the Congress and held their first meeting Sept. 27. They number 150 members, one half of whom are French. This number has been divided into 5 sections, and each section has been assigned to certain groups of subjects, as follows: Section 1.—54 members; magneto-electric and dynamo-electric machines; electric lighting, motors and transmitters of power; boilers, steam, gas, and hydraulic engines applicable to electric industries. Section 2.—40 members; cables, wires, etc., lightning rods; telegraphy, signals; telephones, microphones and photophones. Section 3.—22 members; batteries, etc.; medical applications of electricity; electro-chemistry. Section 4.—14 members; static electricity; measuring apparatus. Section 5.—20 members; instruments of precision, electro and permanent magnets; compasses, electric clocks; miscellaneous.

The American jurors, seven in number, are distributed as follows: Professors Barker, Rowland and Mr. Goodwin, section 1; Professor Carhart (who will be remembered by many New York and Chicago students of electricity) and Dr. Freeman, section 2; and Lieut. McLean and Capt. Heap, section 3. Each of these sections is composed one half of Frenchmen.

The Congress has nearly completed its labors, and will probably adjourn inside of a week. Among the most important of its proceedings is the change made in regard to the units of electrical measurement, which may be briefly summed up as follows:

The practical units, the ohm and the volt, retain their actual definitions— $10^9$  and  $10^8$ .

The unit of resistance (ohm) shall be represented by a column of mercury of a square millimeter cross-section at the temperature of zero centigrade. An International Commission is charged with determining anew the length of such a column of mercury.

The current produced by a volt through an ohm shall be called an ampère.

A coulomb is the quantity of electricity given by an ampère in a second.

A farad is defined by the condition that a coulomb in a farad gives a volt. So the volt acting through an ohm gives a current of an ampère; that is, of a coulomb per second; and a farad is the capacity of a condenser which contains a coulomb when the difference of potential between the two plates is a volt.

It will be noticed that the German name

Weber has been thrown out entirely, and replaced by the French one of ampère, and that the new unit of quantity is called a coulomb, also a French name. One would think that America, with such men as Franklin, Henry, Morse and others, had done enough toward the development of electricity to deserve a place on this list, since it is made up of the names of the leading electricians of different countries. England, Germany and Italy have one name each, while France, with a selfishness that is, perhaps, characteristic, takes the present opportunity, with a Congress composed one-half of Frenchmen, of appropriating two names. If the juries are going to give their decisions with this spirit of egotism, the foreigners have not much to expect where they happen to come into competition with French exhibitors.

The great Edison machine, which is said to run 1,200 incandescent lights, has at last arrived and the bed-plate is already in the building. It is expected to be in running order in a week or ten days, and much interest is shown in the result of the experiment. The Edison people have been given the contract for lighting the Grand Opera-house, and commence running the wires at once. About eight hundred lamps will be required. This is certainly an indication of the high estimation placed upon this system by European electricians.

Dr. Loch-Labaye, of Belgium, has on exhibition an instrument which he calls a pantelephone, that does some very remarkable things. It is nothing more than an extremely delicate microphone, with a Bell receiver. The microphone consists of a thin piece of cork,  $2\frac{1}{2}$  inches long and  $1\frac{1}{2}$  inches wide, suspended by two light springs. In the centre of the cork, at the lower edge, is a hard carbon button, and resting against this button is a brass point. This arrangement is placed in a small box, the front of which is covered with a piece of cloth, to prevent the breath or disturbances in the air from blowing the points apart, and the construction of the instrument is so delicate that it transmits well with the speaker thirty feet away from it. The circuit used is a short one—not more than 100 metres long.

As mentioned before, there is nothing at the Exhibition, so far as I have seen, that is of an entirely novel character, although there is much that has an historic value. Among these latter is the first dynamo-machine, made by Professor Pacinotti, of Italy, in 1863. This is the machine that has created so much discussion on account of the claims made for it of antedating the Gramme machine. Sawyer and others have described it. It certainly contains the Gramme armature, and, as it was given to the world nearly twenty years ago, invalidates the Gramme patents, which a company attempted to dispose of in America a few months ago. Professor Pacinotti now lives at Cagliari, Sicily, and has been before the Congress vindicating his claims of priority. The very efficient Brush machine is constructed with this armature.

The public interest in the Exhibition continues, and the turn-stiles at the entrance are registering from seven to nine thousand admissions daily. On opera nights the crowd is always greatest, and these people will stand patiently in line for an hour or more, for the privilege of about three minutes of the opera through the telephones. The experiment of connecting the Théâtre Français with the Palais de l'Industrie has failed, for some reason or other. The success of this Exhibition is so great that other cities are beginning to show an interest in electrical matters, and notices have been served around of an international exhibition of electricity, to commence at the Crystal Palace, London, Dec. 1, which is, however, being gotten up by private parties and not supported by the English government. Bordeaux also has an exhibition commencing next June, which, until this year, has been international for exhibits of wines and liquors only, but they now propose to make it international for electricity. There always was a family feeling between these two branches of industry.

A dispatch from St. Petersburg, on the 12th inst., says: It is reported that a new conspiracy against the life of the Emperor of Russia has been discovered, Nihilists in the telegraphic service having on various occasions betrayed to the conspirators news concerning the Emperor's intended journeys.

#### Review of the Past Two Weeks.

The knock-down blow given to the Western Union by the President of the Produce Exchange, complaining of bad telegraphic service, seems to have had the effect of bracing them up all around, so much so that the past two weeks have been notable principally for the absence of complaints.

The operators, as a body, have had little or nothing to complain of; and, with the election of the old management, everything promises to go along smoothly for a while.

The annual meeting of the Western Union Co. was held last Wednesday, Oct. 12. President Green's annual report will be found in another column.

In Ottawa, letters patent have been issued by the Secretary of State under the Canada Joint Stock Companies Act of 1877, incorporating David Hatton, of Pererborough, Ont., R. A. Morrow of the same place, T. T. Turnbull, Montreal, G. B. Williams, of Lafayette, Indiana, and John F. Olmstead, of Washington, for the purpose of telegraphic extension throughout the Dominion. According to the charter the company, which will be known as the Canada Mutual Telegraph Company, has power to erect and work lines of telegraphic communication from and to any place throughout the Dominion, either by land or water. The total capital stock of the company will be \$1,000,000, divided into \$10,000 of \$100. The company expects to have lines running into Ottawa by the middle of November.

A good deal of ill-feeling has been manifested between the Western Union and Mutual Union, concerning principally the existence of the "Union Telegraph Construction Company," an alleged side-show attached to the Mutual Union—but there is little in it to interest those not connected with Wall street.

The "underground" people seem to have experienced a grand call to arms, and they display great activity. In Philadelphia especially the work of burying wires underground has been prosecuted with great vigor in the past fortnight.

The continent of Europe is experiencing a grand rush of telegraphic business, due mostly to the warlike operations in Tunis.

Much interest has also sprung up in South American telegraphy. In an elaborate report to the shareholders of the Central and South American Telegraph Company, Mr. James A. Scrymser, President of the company, states that contracts have been concluded for 3,082 nautical miles of submarine cable. Twenty-two miles of cable are being completed daily, and it is reported by the company's electrician to be of very superior quality. No less than five steamers will be necessary to transport the cable and its accompanying material. The first shipment will clear from London Nov. 15, or pay a penalty of \$1,000 per day for each day's delay; the other shipments will follow at fixed dates under heavy penalties for delay. The cable connecting Panama with Callao is to be completed by May, 1882, and it is expected that the whole line will be in commercial operation during the ensuing month of July.

#### A Chronological Sketch of the Magneto Bell, and How to Become Acquainted With It.

The present well-known magneto-telephone signaling bell is an aggregation of different inventions and mechanical movements, all of which have been added as it became evident that they were needed.

When the telephone became a business necessity, a compact, easily managed and easily operated call became also a business necessity.

Some devoted spirits who had got into a deep rut stuck bravely to their system of calling and signaling by breaking and closing the circuit of a galvanic battery. Longer heads, however, early foresaw that this would not do, and that a

motive power which from its very nature demanded a complete rejuvenation every six or eight months was not the motor to make a practical success of the new instrument. It was also evident that a more popular method of signaling was imperatively called for. A vivid realization of what was required set the longer heads to thinking, and the result of the unusual effort was soon seen in the attempt to adapt magneto currents to the end in view.

The first attempts were crude, and, while the signaling currents were indeed generated by a magneto machine, it was a machine much resembling the early apparatus of Pixii and Clark. The generator was connected in one branch circuit at the end of the line, the telephones in another, and the signaling bell in a third, the several branches being connected alternately by an ordinary three-point switch. The generating device was simply a pair of helices flying around in front of a large compound horseshoe permanent magnet, and the ringer was a modification of the ordinary Siemens' polarized relay.

Two troubles were speedily developed in this bell—first, it was difficult to arrange an armature sufficiently delicate to respond promptly to the rapid changes in polarity of the generator; secondly, it was not easy to cause the hammer to strike the bell hard enough to make a loud sound.

It is a well-known fact in natural philosophy that, when there is a problem to be solved or a difficulty to overcome, provided there is, or seems to be, any money in it, the American inventor will be after it, and the chances are ten to one that he will succeed in its solution; for, like Cardinal Wolsey, "No man's pie is free from his ambitious finger." The present case was no exception to the rule.

Finding the ordinary polarized armature to be comparatively ineffective, the first, and still the most important, invention and improvement was made by Mr. Thos. A. Watson, who, instead of clinging to the steel armature, took a new departure by introducing in front of the electromagnet of the ringer a soft iron armature, pivoted at its centre, and being inductively magnetized by the proximity of one or more permanent magnets. This improvement made the magneto bell what it is, by at once increasing its range and making it extremely quick in action, and much less liable to become incapacitated by lightning. The high resistance of the generating coil was now shunted ordinarily out of the circuit by a spring and button, and only cut in when a signal was to be sent.

The next improvement was the incorporation of the automatic switch. The object of this was to change the line from the bell to the telephone by the mere act of removing the telephone from its support. This was first done by H. L. Roosevelt, of New York. The advantage of such an arrangement was so obvious that many had doubtless done this before, and there are now many claimants for the honor of this invention; but, however the priority may stand, there is no question that Roosevelt was the first to protect his right by letters patent.

Just about this time the idea of the necessity of absolute privacy commenced to gain ground, and the secrecy switch of Doolittle and others was the result. This was next applied to the magneto bell, and for a long time was much used.

Soon afterward the battery transmitter was brought into general use, and it was at once seen that to use profitably the Leclanché, or any other open circuit battery, it was necessary to adopt means to close automatically the local circuit, when the transmitter was to be used, and to open it again on the completion of the conversation. This was done by several inventors about the same time, two of whom, Anderson and Briggs, of Cincinnati, patented the improvement, much to the disgust of others. The entire improvement consisted in the attachment of another spring to the ordinary automatic switch.

Shortly after this the Siemens armature was substituted for the old revolving spools, by which

substitution the power of the generator was greatly intensified and the ringing power of the magneto bell at this point was so strong that any bell failing to ring loudly through a resistance of from 6,000 to 10,000 ohms was considered of poor quality.

Other improvements have from time to time been made in the mechanical construction of these bells, and each invention, while frequently futile itself, has pointed the way to something better. The power was first brought to the revolving coils by a gear-wheel driving a pinion fixed on the axis of the armature. This was superseded by a large wheel, the periphery of which was surrounded with a cord of rubber, which, by friction against a similar band of rubber on the periphery of the smaller wheel, revolved the armature. A very short lease of life was granted to this device, as it was soon found that the continued attrition between the two rubber surfaces ground its substance away. It was in turn superseded by the transformation of both wheels to pulleys, which were connected by a short but strong belt of rubber. The present method in use is once more a friction, but this time a rigid wheel of brass, working in a groove arranged on the edge of the smaller wheel, which may either be of metal or hard rubber. A high tension of electricity is obtained by the use of these magneto bells, and it will either ring a bell or drop an annunciator through an extremely high resistance.

The latest improvement in this branch of manufacture is the automatic shunt breaking device. This is an ingenious mechanical movement so arranged that, while the high resistance of the generating coil is ordinarily cut out, as soon as the crank is turned the short circuit is broken and the generator is cut in.

Not many instructions are requisite for the proper management of three bells. In the first place, an amateur telephone man should never undertake to connect a bell in circuit until he can understand its internal arrangements. The first time he gets hold of a new bell he should open it and commune with himself as follows: "This bell is to give a signal from somewhere else, so that for that purpose it must, when the telephone is on the hook, have a complete circuit through the bell magnet from screwpost to screwpost," and forthwith he will trace it out, and if he be wise he will make a diagram of it. "This bell is to be able to send signals to other places; it must, necessarily, therefore, have a circuit from one line screwpost to the other, through the generating coil, when the short circuit around that coil is broken either by a finger button or by the automatic device before described, when the telephone is on the hook." This also he will trace and pencil down. He will say further: "When my telephone is removed from the hook, I must have a line through my telephone and transmitter, while the bell circuit is broken." He will examine and note that. Finally, he will see that his local battery circuit enters the bell for the sole purpose of being opened and closed when necessary, and he will trace the connections for that purpose.

Having thus, as it were, analyzed the bell, he will be better prepared to grapple with any trouble that may arise. When he screws his bell up he will, of course, see that each binding screw is tight, and that a ground wire of thick wire is connected to the ground binding screw; and whenever he inspects the instruments at that office he will not fail to test both the generating and ringing power of the magneto bell.

T. D. LOCKWOOD.

#### Telegraphic Matters in the Quaker City.

During a recent flying visit to Philadelphia we found the representatives of the Mutual Union Telegraph Company actively engaged in fitting up the main office of the new company in that city. The location, which is an excellent one, is in the Times Building, on Chestnut street, a few squares—as they say in Philadelphia—above the Western Union general office. Mr. H. C. Robinson, formerly of the W. U., has been appointed manager of the new company.

The telephone company will soon move its

offices from where they now are (Fourth and Chestnut) to a new building in process of construction across Chestnut street. In their new quarters they expect to be even more pleasantly situated than at present. This is one of the best paying telephone companies that we know of. Mr. W. D. Sargent, the general superintendent, was formerly an old and well-known telegraph man.

Messrs. Partrick & Carter, of 114 South Second street, well-known to the readers of THE OPERATOR, report business very lively. They are turning out large quantities of telegraph and telephone instruments and supplies, keys—especially of the "Lattig" and "Excelsior" patterns—sounders, relays, learners' instruments and the like, as well as of the Fitch Chlorine Battery, of which they are the sole manufacturers. Mr. Partrick is an old-time telegraph operator, and his associates of years ago will, we are sure, be glad to know that the house of which he is the senior partner has been so successful.

Mr. Alfred F. Moore, of 200 and 202 North Third street, manufacturer of insulated wires, says that his business has increased many fold since the advent of the telephone and electric light companies. He adds, however, what is very true, that the competition—if he had said rivalry, perhaps it would have expressed the situation better—in this business has for a long time been so bitter that the profits accruing to manufacturers are very small indeed.

Mr. R. K. Pearce, at 59 South Fourth street, devotes most of his time at present to erecting electric light, telephone and private lines. He keeps two gangs of men constantly at work and does a large and, we hope, remunerative business. Mr. Pearce was formerly an operator in the Philadelphia office, and deserves all the success he may achieve.

Mr. David Brooks, 22 South 21st street, manufactures the Brooks Insulator, now so well known. These insulators are much used in Philadelphia and Pennsylvania, as well as throughout the country. Mr. David Brooks, Jr., at the same number, makes telegraph and telephone cables a specialty.

#### Free Advertising.

We find in the Philadelphia *North American* the following communication from this city. The writer may possibly be "Professor Maurice Keil, M. A., C. E.," though that is not the name signed to it. Anyway, he says:

"In a recent trip in Europe I was delighted to find that young men there were studying a new profession, and one that had not yet become overcrowded. Telegraph engineering is studied as long as our students study medicine or law.

Several telegraph engineers are worth nearly \$5,000,000, having made it all in this new profession. It is one of the few occupations that women are eminently fitted for. We have too many lawyers and doctors. If any of the younger readers of your admirable journal would be interested in this European college of electricity, I should be pleased to give them any information in my power.

Receive, sir, my distinguished considerations."

A SPLENDID PUFF FROM A METROPOLITAN JOURNAL.

[From the New York World, Sept. 28.]

"In point of fact the average telegraph college—there are some honorable exceptions, but they are very, very few—is a thorough and heartless fraud. For a small sum of money a boy or girl is taught the Morse alphabet after a fashion, and in a few weeks turned loose on the community, utterly without grounding in the elements of telegraphy, to say nothing of that acquaintance with its theory and that familiarity with practical details and the daily life of the world absolutely necessary in an operator. The average telegraph college flaunts a cunningly devised advertisement implying that its graduates are guaranteed employment at lucrative wages, but its dupes are not long in discovering that what they took for a contract is no contract at all, and they are utterly unable to understand why the average telegraph manager prefers a bright messenger who has taken a fancy to the key and from a tender age has been learning office routine and detail, to a diplomé, who must not only learn everything but unlearn everything."

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, OCTOBER 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE STRONGEST DIRECTORY.

The announcement of the reelection of Dr. Green, Gen. Eckert, Mr. John Van Horne and the other old officers of the Western Union will be very gratifying to a great majority of the employés of that vast organization. Mr. Cyrus W. Field is reported to have said that the harmonious blending in the new Board of Directors of hitherto conflicting interests forms "the strongest directory in the United States." Let us hope that coming events may prove and emphasize this prediction; and that, considering the company's recent show of kindness and courtesy toward its operators, Mr. Field may soon be justified in adding that it possesses also the strongest, most contented and loyal force of workers in the United States.

In heartily commending the reappointment of these executive officers, one and all, we should also add that it is our duty, as faithful workers, to extend to them all aid within our power to further the improvement of the service; not so much for any one of them as an individual, but as an official of the greatest telegraphic corporation in the world, and as one whose interests are closely woven and interlaced with, and cannot be disassociated from, our own. We have found these executive officers, as a rule— notwithstanding unthought of and unforeseen obstacles in their way—conscientious and fair men, of broad views and wide sympathies, and their conduct toward us as a body has, in the main, denoted a definite, if not always an acceptable, order of conduct, upon the consistency, at least, of which we could depend.

We have had occasion, it is true, to make complaint of the management, but never to our knowledge when the master hand of Dr. Green or Gen. Eckert held the reins. The bumptious small fry, egotistical, insincere and selfish, did undertake for a while to ride the willing horse to death, but our quiet and dignified but firm demand for a halt soon reached the ears of their superiors, and a whirlwind seems to have struck them and their pennywise, pound-foolish schemes. Their unkindest cut, perhaps, came in the written, frank acknowledgment of Gen. Eckert that "Our employés are rendering faithful and efficient service;" and this generous spirit, backed by a not inconsiderable increase of pay in some quarters, and the speedy inauguration of a system of paying fairly for Sunday work, together with a complete wreck of the plan to exact "extra" labor free, have put a wholesome check upon certain influences, which are thoroughly understood in all

quarters, and have prevented the loss of much money and valuable time.

We, therefore, who have as a body only just begun to develop the great strength that has lain latent within us—and which by some persons has, until very recently, been undervalued or ignored—have now abundant opportunity to demonstrate that probity and courtesy are not thrown away upon us. The directory has been declared strong, and it is only meet that we should prove that the working force, when properly treated, is no less strong. We can best attain this end by performing all our duties with scrupulous exactness, for the failure of one branch of the service to bear its proper share of the burden reacts upon the other and higher branch to weaken and diminish the earning capacity of both combined.

There are still some pettifogging officials, who have been aptly called salary scalpers, whose resignations might be demanded for fooling their superiors if for nothing else; and, since resignation is about the remotest idea they entertain, we will pledge the operators to pay by voluntary subscription for the team of horses necessary to drag any one of these canting upstarts from his snug position. We could then go on, without interference, contributing our little mite, as faithful and efficient workers, toward the development of all the wonderful resources of the telegraph, and toward securing all of the benefits to be derived from the natural growth of the country and the steady increase of its commerce.

We sincerely hope that during the coming fiscal year the Western Union may earn all that Dr. Green in his annual report has claimed for it; and that, with the executive ability and fairness of its officials, and the faithfulness and energy of a well satisfied, well paid, competent and thoroughly loyal force of operators, it may soon present not only "the strongest directory" but also the strongest solid organization on the continent.

SOME surprise has been expressed at the spectacle of a twenty-two-year-old boy, Mr. George J. Gould, being placed among the gray-heads of the Western Union directory. If the young man be as level-headed as we would expect the son of Jay Gould to be, and keeps measurably clear of his un-mnemonic partner, Mr. Giovanni Purissimo Morosini, he should be as good a director—as true, as clear-sighted, and as successful as any in the concern. His age has nothing to do with it, for many a man is older at twenty than others at fifty. The patriarch is no better than the adolescent. Cæsar, when he sent his hosts against Cleopatra, was but 18 years of age; Napoleon was Commander-in-Chief of the armies in Italy at the age of 26, and Alexander the Great, who conquered the world and then wept because there were not more worlds to conquer, died at the age of 32. Nor is the sudden transition from one sphere of life to another any bar to success. Semiramis was in Assyrian slavery at one time, and within a single year became a queen, and made her name immortal by the building of Babylon. But, while reading of the three great successful generals spoken of, let this youthful scion of a noble house reflect upon their end. The first—Cæsar—after having conquered 800 cities, and killing his only rival on earth, was miserably assassinated. The second—Napoleon—who issued a proclamation, forbidding the world to trade with England, died an exile on a lonely ocean rock. The third—Alexander—who had his brow encircled with

a chaplet dyed in the blood of millions, set a city on fire and died in a state of intoxication. If Mr. George J. Gould should succeed, we shall be proud to be able to point to one more American Little Giant. We look to our young men as the future masters of our country, and welcome them to their new positions; but when we see the kind of "coaching" they get, it leads us to reflect how wretched sometimes is the ending of all that the world calls great.

THE growth of the telegraph system in Japan has been rapid. It was introduced in 1871, and at the beginning of last year comprised 3,929 miles of line and 9,345 miles of wire. During last year the total number of telegrams reached 1,272,756, of which about 96 per cent. were in Japanese. Including the five submarine cables, the total receipts were £108,323, and the expenditures £101,674. It was the first year when the lines returned an excess of revenue. Operators are trained from among the youths of Japan in a special school recently opened for that purpose. During this year 227 were appointed to positions and 77 still remain under tuition. They are taught to write English and French. For 20 characters in the Japanese language, for a distance of 60 miles, the average rate is about 2 sen, or a little less than 2 cents. This is taking the entire line from Tokio to Nagasaki as a basis. But for shorter distances the rates are higher. From Tokio to Yokohama messages are transmitted for 7 sen, or about 4½ cents. There are 112 offices open for general traffic, besides 70 others connected with the government, the railways or the police. Last year the number of messages transmitted was 1,272,756. There are 348 Morse instruments in use, 26 single needle-blocks, and 29 Bell telephones.

CONTENDING for circuit has hitherto been considered a very harmless diversion for the operators; but, since the boys have got down to duelling with pistols instead of keys and long-range wires, we may look for an abatement of the detestable practice. In our issue of June 1 we recorded the fact of Messrs. Cone and de Fevre, two haughty operators in North Carolina, meeting on the field of honor to fight out with deadly weapons a quarrel over the wires, and of their ending up in an inglorious knock-down-and-drag-out affair. But, as we learn from a dispatch from Denver, Colorado, the operators are more thorough in this kind of work out there. We are told that, on the 7th inst., a controversy took place over the wires between J. S. McBride, the operator at Glorietta, and Jack Handy, the operator at Levy Station. Jack immediately went to Glorietta, and called upon McBride about midnight; but his reception must have been of a decidedly warm character, for his remains were found next morning lying on the office floor. Jack had been fatally shot through the head, while Mr. McBride was missing. There are vacancies for operators at Glorietta and Levy Station, respectively.

THOSE unfortunate telegraphers who have been literally squeezed out of the business since the consolidation, will find an interesting interview with "a prominent official" of the Western Union, reported in the *Chicago Morning News*, of September 12. One of the questions asked was, "Haven't you as many operators as before the consolidation?" And the guileless, truth-telling prominent official replied, with a smile that was child-like and bland, "No. Whenever

there is a consolidation a great many men, in fear of losing their places, drop out and go into other lines of business." Now, in view of the great number of men who have (involuntarily) "dropped out;" of the declaration of Jay Gould's personal organ (September 16) that certain other prominent officials were told that their room was preferable to their company, and the attempt to cut and carve all around, we are reminded vividly of still another prominent official who told us that delicious yarn about the One Man in Charleston. For pure, unadulterated taffy, commend us to your high-toned, sweet-tongued prominent official.

In another column we reprint a tolerably fair specimen of the subterfuges to which certain "teachers" of telegraphy resort to obtain "students." The statement that "several telegraph engineers are worth nearly \$5,000,000, having made it all in this new profession," might mislead many unsophisticated countrymen into wild dreams of wealth. We are glad to see such a clever diagnosis of the telegraph college case as is afforded by the reputed organ of Mr. Jay Gould, *The World*, and which we reprint to-day. If the Telegraph College business must be kept up, let it be done honestly; and, instead of making false promises of fabulous salaries, and throwing out hints about men who have made five million dollars in the business, let them tell the truth; and, moreover, let the unsuspecting dupe understand that telegraphy is, as *The World* aptly says, "A thing which it is always well for a bright boy or girl to learn, but, after all, the prizes in the calling are decidedly few, and to its best members it offers a stepping-stone—a stage in the career rather than a career."

WE have to record once more the "marriage by telegraph" of two idiots in Colorado, who will doubtless obtain their next instalment of notoriety in the Divorce Court. There is much to be deplored in these travesties on the holy bond of wedlock, for the principals are usually unsophisticated and silly creatures; but what shall we do with the alleged minister of the gospel who lends the supposed dignity of his sacred office to such a farce, and consents to sit in a telegraph office, and "marry" a couple, neither of whom he can see or probably ever will see? Every young person, particularly every young girl, should be made to understand that when the hour of tribulation comes there are probably not half a dozen States in the Union where such a "marriage" will, of itself, be held to be valid in law.

THE subscriptions to the fund for Mrs. Garfield and her children close to-day. The committee announces that any subscriptions received after this date will be returned to the senders, with a polite note stating that the Garfield family have all the money they need. For this reason, however much we may regret it, it is impossible that the telegraphers can be represented in it as a body. If the time had been extended so as to afford sufficient notice to the craft, and to admit of replies from all parts of the country, they would have made a very creditable showing. We have received a number of subscriptions from telegraphers, but under the circumstances will be compelled to return the money to the donors.

If it be proved that, as is now asserted, the disastrous fire in Philadelphia last Wednesday night, in which a dozen or more persons were burned to death, originated from a red-hot

morsel of charcoal falling from an electric lamp, the inventors had better get to work to remedy this defect. This new source of danger was first revealed about a year ago, when a falling spark started a fire among some papers in the British Museum; and it was further illustrated last August at the Electrical Exhibition at Paris, when an electric light set fire to the establishment. The electric light is fast making a record which may turn popular prejudice against it.

It is now stated positively that a new submarine cable is to be laid between Thurso, Scotland, and Iceland, via the Farøe Islands. It is proposed to have the general office in Reikjavik, Iceland. There is more in this announcement than most telegraphers would think, since it will form the first link of a chain between England and America, and in which the longest stretch of water is 750 miles. This fact is a good one to remember, for a cable over the ordinary trans-Atlantic route costs at least five million dollars to commence with, not to speak of repairs, and at best lasts only ten years.

THE question of underground wires, which has been agitating the public mind for some time, seems to be in a fair way of solution. In many large cities the work of making the kite-tails feel lonesome by burying the wires underground has been commenced, and a few years at the furthest will see the total abolition of telegraph poles in cities. The companies will find the first cost of underground wires very heavy, but the absence of expenses for repairs, such as are needed after heavy sleet-storms, will make their enterprise profitable in the end.

C. T. R.—Some receivers have the faculty of copying a long way behind the sender—sometimes as much as 20 or 25 words—but we are not aware that any record of such feats has ever been kept, except by tradition. Mr. P. B. Delany, the inventor of the Delany relay, Delany cable, etc., and Mr. Richard O'Brien, superintendent at Scranton, Penna., have possessed this faculty to an eminent degree. It is generally an unsafe way of working, however, and we should advise you to "copy up" as close to the sender as you can.

THE introduction of electric railways into the United Kingdom—the first having been projected for the Giant's Causeway, in Ireland—will be watched with a great deal of interest on this side of the ocean. The estimate that the expenses for haulage on a tramway such as this with horses would be twenty-three cents per mile; by steam about fifteen cents, and by an electrical motor two cents per mile, should not be overlooked by our inventors and investors.

It should not be very difficult to bring about an international understanding with regard to the subject of protecting submarine cables in war time, and the sooner the suggestion made with regard to that matter at the Electrical Congress is carried out the better it will be for the credit of civilization in general and of companies engaged in ocean telegraphy in particular. The commercial and social interests of the whole world are concerned in this question.

THE Czar of Russia has now, as reported in another column, discovered that his telegraph operators have been divulging the secrets of his telegraphic correspondence to the Nihilists. This reminds us of another St. Petersburg dispatch, about two months ago, in which it was stated that the entire telegraphic force at Gatschina had been arrested for treason. At this

rate Siberia will soon be able to organize a telegraphic "Old-timers' Association."

It is proposed in England to solve the question with regard to a suitable motor for a Gramme machine by attaching one to the treadmills in the prisons. Burglars in temporary retirement will thus, in their daily, weary tramp on the "mill," grind out sufficient energy to illuminate a whole town by the electric like; and so, in a measure, put an end to the nightly operations of their fellow-cracksmen who are temporarily at large. Electrical retribution grinds slow but sure.

WITH the present rapid progress of underground wires, the typical telegraph magnate, who had literally "hewn" his way through the world to fame and fortune, will find his occupation gone, and he will have to discover some method of "competing" with a rival company other than by the remarkable possibilities that lie in the axe and the saw.

THE Western Union seems to have done very well during the past fiscal year, and, with the re-election of the same officers, there is no reason why the ensuing year should not be still more prosperous, provided that the enterprising sub-officials, yept salary scalpers, do not get them into another snarl with the Brotherhood of Telegraphers.

TO-DAY, at Paris, the competitive lists for the electric lighting of the Grand Opera-house will close. Other competitions will, however, follow before the contract for lighting that structure is finally given out. We may then learn something definite about the merits of the various systems.

THE coming celebration at Yorktown, Va., reminds us that it was at that place where Mr. D. Brainard Lathrop, the first of our profession to fall a victim to the rebellion, was killed. In entering Yorktown, May 5, 1862, he was fatally injured by the explosion of a torpedo, dying the same day.

THERE are evidences of a great boom in the construction of telegraph in China. The fear of a Russian invasion has taught them the necessity of rapid communication, and it seems as though all the great cities of the empire will soon be united by telegraph.

THE Western Union officials are receiving much well-earned praise for the efficient manner in which they handled the enormous business consequent upon the funeral of General Garfield at Cleveland.

THE election of President George B. Roberts, of the Pennsylvania Railroad Company, to be a director of the Western Union Company, ought to go a long way toward harmonizing the differences between the two corporations.

THE Paris correspondent of the *London Times* says that with proper use the induction balance could have made no error in locating the bullet in President Garfield's body.

THE new Board of Directors of the Western Union is pronounced by Mr. Cyrus W. Field, who ought to know, to be the strongest executive team in America.

THE first number of *La Moniteur Official de L'Electricité* has made its appearance in Paris.

WESTERN UNION stock is quoted at 86½. Last issue it was 86⅞.

### Another Telegraphic Marriage.

For a romantic marriage, a Boston couple are entitled to the first prize. About ten days ago Mr. C. A. Dutton and Miss Nellie J. Throcmorton, both of this city, accompanied by Herman A. Throcmorton and Mrs. H. A. Throcmorton, appeared at the Manitou House at Colorado Springs, and made inquiry concerning the difficulties of ascending Pike's Peak, and in the course of the evening engaged the Rev. Dr. J. Edwards Smith to go with them to the summit of the peak for the purpose of performing a marriage ceremony. Next morning at sunrise six bronchos stood in front of the Manitou House, and in a few minutes the entire party were in the saddle. The Rev. Dr. Smith was mounted upon a particularly lively brute, which, after waltzing on two legs down the road, from the hotel to the bridge over the fountain, wound up his performance by bucking the clergyman over the railing into the stream. Mr. Smith was rescued, and although not seriously injured, the accident deranged the plans of the wedding party, for the clergyman declined to risk his health by continuing the trip, in spite of all persuasion and the offer of a safe and quiet animal. After much consultation, the young gentleman suggested that Dr. Smith should come to Colorado Springs, and from the United States telegraph office, which is connected with the signal station on the peak, perform the marriage ceremony by telegraph. The doctor consented to this arrangement, and thus, by accident, another element of romance was added to this already romantic affair.

The summit was reached about noon, and Sergeant O'Keefe was found in charge of the station. He received his visitors with his usual hospitality, and, when their intention of celebrating a wedding was announced, was overjoyed, and set about making arrangements. The instrument room of the signal station was decorated with flowers and flags, and then the Sergeant seated himself at the telegraph instrument and sent a call down to the Springs office, 10,000 feet below. Officer Jones, who was in charge, replied and informed the Sergeant that the Rev. Dr. Smith had arrived and was ready to proceed with the ceremony. The young people joined hands and stood before the Sergeant, the father and mother of the bride standing on either side, and the Sergeant at the instrument read off the questions of the clergyman as they came thrilling over the wires. There was a rapid clicking for a moment, and then Sergeant O'Keefe, in a solemn voice, repeated the message: "Charles A. Dutton, do you take Nellie J. Throcmorton to be your lawful and wedded wife?" "I do," responded the bridegroom, with evident emotion. The Sergeant tapped the telegraph instrument, and in a moment another message came and was read by him: "Nellie J. Throcmorton, do you take Charles A. Dutton to be your lawful and wedded husband?" "I do," said the bride in a low voice. The Sergeant heard it, however, and transmitted the reply. There was a moment's pause, and then came the solemn concluding words. Up from the valley to that small stone keep, 14,000 feet above the ocean, came that message, making two hearts one: "Then I pronounce you man and wife."—*Denver Tribune*.

### The Moral Influence of the Telegraph.

"One touch of nature makes the whole world kin."

Men have accepted this saying in a broader sense than Shakespeare dreamed. But for a world-wide manifestation of its truth, for a signal demonstration of the kinship of humanity, men have had to wait until science and invention had brought all nations into something like instant communication. It was the touch of the telegraph key, a favorable opportunity being presented, that welded human sympathy and made possible its manifestation in a common, universal, simultaneous heart throb.

We have just seen the civilized world gathered as one family around a common sick bed, hope and fear alternately fluctuating in unison the world over as hopeful or alarming bulletins passed with electric pulsations over the continents and under the seas. And at last, on the same day, the nations stand in sympathetic mourning; a spectacle unparalleled in history;

a spectacle impossible on so grand a scale before, and indicative of a day when science shall have so blended, interwoven and unified human thoughts and interests that the feeling of universal kinship shall be, not a spasmodic outburst of occasional emotion, but constant and controlling, the usual, everyday, abiding feeling of all men toward all men.—*Scientific American*.

### At Long Branch Sept. 6 to 20—Enormous Amount of Telegraphing Done, Notwithstanding the Inadequate Facilities.

To the Editor of The Operator:

SIR: The last two issues of THE OPERATOR have contained extracts from the New York Herald and other papers relative to the telegraph service at Long Branch during the illness of President Garfield, and as no abler pen has undertaken to set matters right, I would like to explain things a little. The President was taken from Washington on the 6th of September by a special train, which left Washington at 6 A. M. and reached Elberon at 1 P. M. Mr. Marean, of the Washington office, left for Long Branch on the night of the 5th, reaching there at 9 A. M. of the 6th. Upon his arrival he found that no preparation whatever had been made for the expected rush. He at once set to work, and by 6 P. M. of that day had three quads set up and ready for work. When it is remembered that the tables and instruments had to be set up, wires run, batteries made and set up, and connections from outside the office made, the magnitude of the work and the promptness of its execution will be apparent. All the material was sent from New York. The operators, eight from Washington, two from Baltimore, and two from Philadelphia reached Long Branch at 6 P. M. on the 6th, and from that time out there was no complaint on the part of any newspaper, correspondent or private individual.

The delay so much complained of on the day of the President's arrival was confined to the press matter filed for the afternoon papers of that day, which was delayed from the causes mentioned above. It was due, probably, to those having the matter in charge not properly appreciating the situation. By the time the officials have experienced two or three occasions of this kind within reach of the Washington correspondents, they will likely take a different view of the thing.

In spite of all the drawbacks, such as the poorest of poor wires, etc., which any one laboring at the key can readily understand, the work at Long Branch during the time the President remained there, and up to the time of the removal of his remains to Washington, was as good as any work ever done in this country. That is big talk, but figures bear it out. On the night of the 6th of September there were sent 102,000 words. The lightest night of all footed up 46,000 words. On the night of the President's death 167,000 words were sent, and on the day and night following 172,000 words, in all a grand total for fourteen days and nights of over one million two hundred thousand words of press matter, exclusive of the government and commercial business which the occasion necessitated. There were 13 men engaged, except on the last day, that of the 20th, when some operators were sent from New York to the relief of the worn out men who had been on duty for 18 to 20 hours at a stretch.

The President died at 10.35 P. M. on the 19th. The large amount of press sent on that night was after that hour, and so well was it done that at no time during the night were the reporters thirty minutes ahead of the operators.

The New York Herald had made extraordinary arrangements, in view of the expected or probable death of the President that night, but they were not called into requisition. Their correspondent telegraphed at 2 A. M. that all the Herald matter was being sent as fast as filed. The agent of the National Associated Press, who sent more than any one else, said that in all his newspaper experience of fifteen years, he never saw such splendid work. All the other correspondents corroborated his statement, and many of them expressed their great satisfaction personally to General Eckert, who was there at the time.

Considering the small number of men, the poor facilities, and the way the press came in for transmission, the record stands unequalled, as far

as I know. The largest amount of press ever sent in a single night from Washington, where they know what heavy press work is, was, prior to the 2d of July, 175,000 words, which was sent on the night of March 4 last. On the day and night of July 2 and 3, the amount sent from Washington aggregated 450,000 words. At Cleveland, with probably fifty operators, a telegraph office, and an unlimited number of good wires, the total for three nights and days was 300,000 words!

The list of men at Long Branch was M. Marean, in charge, E. C. Stewart, D. Marean, F. Marean, H. McKeldin, J. B. Austin, J. T. Stevens, C. F. Braulik and P. B. Tingley from Washington; John Church and E. H. Trainer from Baltimore, and Geo. B. Pennock and S. A. Boyle from Philadelphia, with Messrs. Mitchell, manager, Casey and Dunivan of Long Branch.

Mr. Marean, with Stevens, Pennock, F. Mareau, Hutchinson, Smith, Klotz and Whelpley, also from Washington, went to Cleveland to help out there during the funeral ceremonies; and a force is expected to be sent from Washington to Yorktown, Va., during the Centennial ceremonies of next week.

This letter is only written to set right the men who did such good work, not only for the W. U. but for the country, during a great national crisis, as a good deal of blame for the failure of the first day would be charged to incompetence on their part, were it not explained. They are chargeable with no part of it, but on the contrary deserve great credit for their work, not only on this but on other occasions.

Before leaving Long Branch, Messrs. Presbury & Hildreth, proprietors of the West End Hotel, where the telegraphers and newspaper people had their head-quarters, entertained the party at an elegant champagne lunch, besides having well supplied lunches set out in the temporary telegraph office during the night.

A series of resolutions expressing the thanks of the party to those gentlemen for their hospitality and personal kindness was passed, and will be handsomely engrossed and presented to them.

FAIR PLAY.

WASHINGTON, D. C., Oct. 11, 1881.

### B. & O. R. R., Fourth Division.

To the Editor of The Operator:

SIR.—The force at Grafton, W. Va., the eastern end of this division, is composed of Mr. A. T. Cline, division operator, Messrs. C. H. Brendell, McCabe and Reitz working days, and Messrs. W. P. Cline and J. C. Neham putting at night. S. Myers is agent and operator at Texas. Mr. Myers was married last week to Miss Fannie Carpenter. Mr. J. W. McPeck, known as "the famous John," formerly agent and operator at Texas, folded up his tent and softly stole away—to Cleveland. Mr. K. D. Walker is manager at Fairmont and J. A. Timms night man. Mr. Walker spent a few weeks in the State of Texas recently, but the sunny Southwest didn't agree with him, so he returned to his old post. He is considered a first-class train dispatcher. At Farmington, Mr. W. W. Campbell is agent and operator. He has held this position nearly fifteen years. Mr. S. A. Card is agent and operator at Glover's Gap, and Thos. Campbell night hawk. Mr. J. G. Courtwright, the former operator at Glover's Gap, had to resign on account of ill-health. He goes to Chicago in a few days, where he has three sons, all of whom are first-class operators. At Littleton, Mr. B. E. McCusky and R. E. Wayman hold the fort. W. R. Walker goes it alone at Bellton. Cameron is the dispatcher's office, and Mr. U. B. Williams is the clever dispatcher, assisted by R. Fitzgerald as operator. P. Judge is night dispatcher, but has been confined to his room for the past three weeks with typhoid fever. Mr. R. E. Morling is acting as night dispatcher. S. C. Gons is at Moundsville. T. A. Daily taps the key softly at Benwood. Ed Gannon is the lightning night man. At Wheeling, Mr. Frank Warden is manager, assisted by Messrs. Williams and Leuz. Mr. H. Comerford is night report man. Mr. C. R. Tracy, the former manager, has gone with the W. U., and he is sadly missed by the boys on the 4th. There are several students on this division, who make the wire hideous with their interrogatories and "G. A. — — —." All offices on this division were tastefully draped in mourning, in conse-

quence of the death of the President. We hear rumors of the Mutual Union coming this way. Let it come. O. HIO.

#### Baltimore Notes.

To the Editor of The Operator:

SIR: Since my last communication several changes have taken place. Charley Stewart, one of the oldest operators in the W. U. main office, has resigned and taken a position with the B. & O. Co. Mr. Stewart is a first-class operator, and is highly esteemed by all. W. Thweatt has also resigned and gone with the B. & O. S. J. Sprigg has been appointed assistant day chief in the W. U. main office. Sam is one of the oldest operators in the office, and well deserved the promotion. On Oct. 1 the employees of the American Union Co. presented J. B. Yeakle, their late manager, with a handsome photographic collection of the old men of the office. Mr. Yeakle is one of the best electricians in this section, having served many years with the Western Union and A. & P., and later with the American Union. His present position as general manager of the American District Co. is well chosen, and the company is to be congratulated upon securing such an efficient manager. The B. & O. Co. are fitting up a large office on Exchange Place, and will be ready for business in a few weeks. The Brotherhood of Telegraphers is meeting with success here. Many prominent operators have already joined, and several more are proposed for membership. It is purely benevolent. In case of sickness a member receives six dollars per week. The monthly dues are fifty cents. It denounces strikes, and is not a secret association. Managers and chiefs are invited to attend its meetings.

G. P. Trick, general manager of the B. & O. telegraph system, is in Cincinnati on business connected with the new enterprise which is being established. We regret to announce the serious illness of E. G. Little, operator at Camden Station. EXCELSIOR.

BALTO, Oct. 10, 1881.

#### Cleveland Chronicles.

To the Editor of The Operator:

SIR: In addition to the operators who came here from Long Branch, on the occasion of the President's funeral, we also had the following from neighboring cities to help us out: Messrs. F. G. Brown, South Bend; J. M. Cronenberg and Mr. Springer, Toledo; Charles Wallace and Mr. Bourke, Detroit; C. F. Nighswarider, Sandusky; Mr. Custer, Indianapolis; Messrs. Talcott, Boughan and McGill, Chicago.

On Monday night, Sept. 26, we had 11 special wires to New York, 6 to Chicago, 5 to Cincinnati, 5 to Pittsburgh, and others working direct with Philadelphia, Baltimore and Boston.

In casting a sly glance about, we observe a wholesome smile on the countenances of several and we quietly ask Mr. Wadsworth the cause. He replies: "A raise of five to ten dollars a month, and I am in hopes of raising every man who is deserving." This is the sentiment we like, for low salaries have been the bane of this office for so long that we—smile ourselves.

Among the new faces here are: Messrs. C. B. French, Detroit; E. L. Swift, Indianapolis; E. L. Ross, Cincinnati; E. E. Linn, Warren, Pa.; A. W. Baumgart and W. B. Richardson, New York; W. Ernesthausen and A. Brucht, Chicago; L. H. Hull, Wellsville, O.; W. D. Fuller, Galion, O.; A. W. Jeffers, Chicago, and George A. Leid. Resigned: A. Schmell gone to Pittsburgh, C. F. Patterson to Chicago, D. Hamblin Cincinnati. Mr. E. J. Cox has returned from Youngstown, where he has been relieving Mr. A. C. Baers, who has been on sick list. Mr. S. G. Sinclair, after an illness of several months, has resumed duty and is looking well. Messrs. S. B. Derickson and J. H. Mayer, old Cleveland men, are again with us. Perhaps I have trespassed too much on your space, but — I. DUNNO.

CLEVELAND, O., Oct. 10, 1881.

The fact that the electric light is trying to blondes and favorable to brunettes ought to settle the question of its general use in this land of the free, the Manchester Union thinks, because anything that discriminates against color is contrary to the constitutional amendments.

## TELEPHONE DEPARTMENT.

The citizens of Portland, Me., are now able to converse by telephone with their friends in Lewiston, Me. The line works very satisfactorily.

The Gilliland Electric Manufacturing Company continues to push rapidly ahead. The number of magneto bells of this company's make now in use has risen to 38,500. Yet the telephone is said to be still in its infancy.

Speaking of the telephone in South Australia, the *Electrician*, of Sept. 24 says: "We hear that a telephone line has been erected between the exhibition at Adelaide and the Exchange; also that the government, for the benefit of the public, intends to form a telephone exchange, to be worked under its own control."

Mr. F. A. Gower, who has achieved a world-wide distinction in connection with telephone interests in Europe, visited the rooms of the Providence, R. I., Telephone Company last week and pronounced the Exchange by far the most admirably arranged he had ever seen. He assured the officials that there was nothing in England or France to compare with it. Mr. Gower, by the way, who formerly lived in Providence, has made a generous gift to the Franklin Lyceum of that city, by which that useful institution is now out of debt.

The Compania Electrica de Cuba, capital \$150,000, with right to increase to \$500,000, has been organized under the laws of the State of New York, with headquarters in this city. An exchange is being built as rapidly as possible. The company has now 150 subscribers, and still they come. By a royal decree, issued from Madrid, the company has acquired the exclusive right to establish exchanges and operate the telephone in the Island of Cuba. The officers are Gen. Anson Stager, President; Fredk. M. Delano, Vice-President, and Geo. M. Phelps, Jr., Secretary and Treasurer. The directors consist of the above three gentlemen and Messrs. F. R. Wells and Jas. H. Howard.

## DASHES HERE AND THERE.

Mr. Edison has constructed a dynamo machine—the largest ever made—having a capacity for a thousand or more of his electric lights.

If you want to become a telegraph operator send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—Adv.

Twenty-seven of the telegraph poles in consecutive order on the Dominion line between Ogdensburg and Morristown were splintered by lightning in a recent storm.

An electric headlight has been successfully used on a locomotive in Australia. It illuminated the track clearly for 500 yards, but the atmosphere there is exceedingly clear.

Messrs. G. W. Pettibone & Co., already so well and favorably known to readers of THE OPERATOR, advertise in this issue an imitation gold hunting case watch at the low price of \$7.

The Congress of Electricians, at Paris, have confirmed the adoption of the ohm as the unit of resistance, and a special commission has been charged with the experiments for determining the exact height of the column of mercury required for the production of the standard.

Brown, Pettibone & Kelly, stationers, 194 and 196 Dearborn street, Chicago, Ill., are sole agents for Farnham's Armaline, the only known cure for writers' cramp and pen paralysis. Its value has been proven repeatedly. Send for circular and treatise.—Adv.

The *Electrician* says that a prize of 1,000 marks (equal to about \$250) is offered by the Electrotechnischer Verein of Berlin for the best essay on the transmission of power by electrical and mechanical means. Essays must be sent in before Oct. 1, 1882. Further particulars as to the conditions of the competition, etc., can be obtained from Herr Julius Springer, Electrotechnischer Verein, Berlin.

Experiments by German scientists in ascertaining the peculiarities of the electric light establish the fact that it is not only healthier than other methods of illumination in leaving the air purer, but that it increases the power of the vision in some respects, especially in distin-

guishing colors. Red, green, blue and yellow are made much more distinct and marked under this light than by daylight.

A dispatch from Cleveland, Ohio, says: The service of the Western Union Telegraph Company, from the arrival of Garfield's remains until the day after the funeral, shows the immense business done for public and private account over the wires. On Saturday, the 24th, 74,852 words were sent; on Sunday, 82,150; on the day of the obsequies, 135,597—a total in three days of 292,599 words. Four-fifths of this matter was transmitted between 9 o'clock and midnight.

A telegram from London, on the 1st inst., said that the ceremony of cutting the first sod on the Giant's Causeway and Port Rush Railroad a day or two previously, at the latter place, was considered an event of great importance in railway enterprise, owing to the fact that it is intended to work the tramway by electricity, the company thus being the first to introduce into the United Kingdom electricity as a motive power for railway propulsion.

The American District, Union District and Domestic Telegraph companies, of Baltimore, Md., have consolidated their respective interests in the American District Telegraph Company of Baltimore City. The company has entered into a contract for a period of years with the Western Union for the delivery of its telegrams and cablegrams, and for the transmission of all telegrams and cables received at any of the offices of the American District by the Western Union. All offices of the American District Telegraph Company are to be branch offices of the Western Union. Mr. J. B. Yeakle, late Manager A. U. Tel. Co., has been appointed general manager of the new company.

At a meeting of the Electrical Congress, at Paris, on the 29th ult., a question was raised in regard to the rights of property in submarine cables. It was stated that at present no government has jurisdiction beyond three miles from the coast, and the cutting of a cable beyond that distance is not a criminal offense. Mr. Siemens, the well-known cable manufacturer, strongly urged the importance of giving some protection to such valuable property as cables. A suggestion of M. Cochery, the French Minister of Posts and Telegraphs, that representations on the subject be made to the different governments, was agreed to.

The Detroit *Free Press* in discussing the condition of the telegraph service says: "Little or no latitude is allowed to the division superintendents. They can scarcely dismiss or hire a ten-dollar-a-week employé without referring it to the home office. This of course destroys ambition, cools enterprise, depresses energy and demoralizes the service. There can be only one end to such methods; but it is not an agreeable prospect to the public to have to wait for it. There will be a reform, or new companies will be formed, or the pressure will be so great that the government will be called upon to take the business in hand. So that the policy is extremely shortsighted and must defeat itself."

So well was everything managed, says a Cleveland dispatch, that no error occurred in transmission by telegraph, notwithstanding that at one time on Monday night over 50,000 words per hour were sent on 38 press circuits from this office, and the promptness with which the business was dispatched surprised all who knew the immense amount of work being done. On Saturday, the 24th, 74,852 words were sent; on Sunday, 82,150; on Monday, the day of the obsequies, 135,597; total for the three days, 292,599. Four-fifths of this matter was transmitted between nine at night and midnight. Beside the regular force here, 25 first-class operators were sent here from Washington, Chicago, Indianapolis, Detroit and Toledo. In the receiving and delivering department more than double the ordinary number of messages were received and delivered each day without any increase of the regular force. All the employes took a personal interest to demonstrate that they could meet any emergency.

The Chinese believe that the falling of any shadow over an ancestor's grave is an insult offered to that ancestor, and, strange as it may seem, this belief is likely to preserve the empire from a nuisance which it will take us many years

yet to get rid of. The dead of a large territory not being collected in any particular spot, but every family having its own graveyard, the telegraph companies who have received charters to construct lines find it exceedingly difficult to place their poles where they will not cast a shade over somebody's great grandfather or mother-in-law. At first, ignorant of the belief of the people on this subject, they undertook to put up the poles along the highways without regard to graveyards. Since then they have learned better, for wherever the Chinaman found a black streak across any grave, he did not wait for the officials to come along and right the matter; he simply proceeded to lay the poles low regardless of consequences. This sort of thing grew rather monotonous for the telegraph people, and now they bury their wires below the surface. China will therefore have the first completed underground telegraph system in the world.

## NEW YORK CITY ITEMS.

### Echoes From 195.

There seems to be a general impression among the operators at 195 Broadway that Mr. Merrihew is a gentleman.

"I am not surprised that he lost his situation," remarked John Lenhart of an ex-Manager of the Western Union; "but the wonder to me is how he ever got it."

Score one for the Continental Telegraph Company. One of its operators at 30 Broad street recently received an office message signed "J. Mocyhow." A repetition rendered it "J. Merrihew." Mr. Merrihew will doubtless object to this manner of torturing his cognomen.

A correspondent at "195," who is not himself personally interested in the matter, complains that since the retirement of Manager Downer, the appointments in the office have not been characterized by as good judgment as formerly. Appointments to chief operatorships, he says, have been made, under the new *régime*, where the persons appointed are not only inexperienced but almost entirely unknown, whereas Mr. Downer's appointments were made from the ranks of the older members who have devoted the best years of their lives to the service. The old and tried men who understand every detail of the business, having made telegraphy a life-long study, and who are practically the backbone of the office, are thus totally ignored when appointments are made; and comparative strangers are called upon to fill the positions rightfully theirs. He adds, however, that perhaps the new management is not aware how these unjust appointments are brought about, and says that investigation will soon convince the most unbelieving that even in a telegraph office practices used only by the lowest politicians are not uncommon, and that unless the gentlemen who deserve the appointments will submit to demoralizing ways their claims of long standing are of no avail.

### Other City Items.

Mr. H. F. Ogden, manager of the Twenty-first street central office of the Metropolitan T. and T. Co., resigned Oct. 1, to go into the electric manufacturing business. The employés of the office presented him with a handsome silver-mounted cane, properly inscribed. The presentation speech was made by Inspector Morris. Mr. Ogden suitably responded. The affair ended with refreshments. It was ably managed by B. Androus, E. G. Brower, E. J. Enright, F. E. Bray and G. Morris, with the assistance of the operators.

We were in error, last issue, in stating that the New York Electrical Society's meeting would be held Oct. 5. The meeting nights are the first and third Thursdays of each month. At the last meeting, which was held in the United States Hotel, Oct. 6, the President, Mr. F. W. Jones, occupied the chair. A paper on "Magnetism" was read by Mr. C. S. H. Small, of the Gold and Stock Telegraph Company. Mr. H. L. Bailey also gave a very pleasing exhibition with the sciopicon. Among the views exhibited were lake and ocean scenes, Thorwaldsen's "Night" and "Morning," an illustration by Doré of Coleridge's "Ancient Mariner," and some humorous sketches. The exhibition was well received, and both Mr. Small and Mr. Bailey

were tendered the hearty thanks of the members present.

On the evening of Tuesday, April 6, 1880, Mr. William E. Sawyer, the electrician, shot ex-Police Surgeon Steele in the head, in the streets of this city. The wound was a serious one, but did not prove fatal. He was convicted of the crime, and sentenced to one year's imprisonment, but was released on \$2,500 bail, pending an appeal. His bondsmen were President Little, of the Electric Manufacturing Company, and Treasurer Anderson, of the same company. Mr. Sawyer, somehow, got into a row with them, and they, on the 30th ult., lodged a surrender piece against him, and he was rearrested and confined in the Tombs. After three days' search he found new bondsmen, and was again set at liberty on the 3d inst.

An enterprising District Telegraph messenger named William Massett, collected \$15 for a Broadway lawyer, on the 13th ult., and de-camped with the money. He made a trip to Rondout, spent the proceeds of his theft freely, and soon found himself with only twenty-five cents in his pocket and no means of reaching New York. In this emergency he hired a row boat for an hour from Joseph Delanoy and rowed down the Hudson until he was overtaken by a propeller, the captain of which towed him to this city. On his arrival he tied up the boat to a North River pier, but the news of the theft had preceded him and he was arrested. In the General Sessions Court, on the 7th inst., Massett, who is only fourteen years of age, pleaded guilty to larceny, and, in consideration of his youth and previous good character, Judge Gildersleeve, instead of sending him to prison, committed him to the Juvenile Asylum.

## PERSONAL.

Mr. Oney Buck, late operator for Chicago & Grand Trunk Ry. at Chicago, is working extra on the Lake Shore & Michigan Southern.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—*Advt.*

An employé of the Portland, Me., Exchange, Mr. Fred Johnston, recently gave a supper at Biddeford, Me., to the employés of the Old Orchard Beach Exchange.

Supt. Corbett, of Detroit, is receiving deserved praise for the promptness with which he got his men to work, and rebuilt the lines burned down during the recent fires in Michigan.

Mr. A. C. Preble, formerly manager of the Portland (Me.) A. U. Co., is to be manager of the Portland office of the new company. Mr. Preble is now in the main W. U. office, Boston.

General Thomas T. Eckert has purchased the property on Ocean avenue, Long Branch, adjoining that of Mr. George M. Pullman, which was owned by the late Charles Barlow, for a summer residence. The price paid was \$35,000.

Mr. M. M. Joyce, who has been manager and operator of the government and W. U. offices at Fort Leavenworth, Kan., for the past fifteen years, died Tuesday, Sept. 27, at Fort Garland, Col., of congestion of the lungs, after an illness of about two months.

Operators Chas. Cormier, Chas. Fitzgerald, Harry D. Sturtevant and Bob Risdon, of Detroit, all first-class men, have resigned since the first of October to accept better positions. Mr. Fred Schauz, chief clerk, has also resigned to accept a better paying situation at East Saginaw.

Mr. R. E. Mulcahy, a well-known telegrapher, who resigned his position as Superintendent of Telegraph Cincinnati, W. & M. Ry., to accept the General Managership of the Elkhart (Ind.) Car-Works Company, reports that when the works are fully started they will employ 300 men.

Mr. Frank Reynolds, Jr., for nine years manager of the Dominion Telegraph office at Port Hope, Ont., but who was thrown out of employment by the recent consolidation, was the recipient, Sept. 19, of a handsome gold watch, chain and charm, suitably inscribed, as a mark of esteem from the citizens of Port Hope. The mayor made the presentation. Mr. Reynolds is now employed in the W. U. main office in this city.

DETROIT, MICH.—The millenium must be ap-

proaching. The first-class men are fast dropping out of Detroit office. Latest departures: Robert Risdon, Harry Sturtevant, Wm. Dillon, Charles Cormier and Mr. Fitzgerald, all on account of small salaries. Arrivals: C. T. Duffie, Mrs. Tillotson, Mr. Smith and Geo. Withey. The advent of the Mutual Union is expected to again thin the ranks. The small salaries operators at Detroit are receiving bids fair to create continual dissatisfaction. Salaries range from \$10 to \$25 less than other cities are paying; hence the departure of so many of the best operators.

### QUIEN SABE.

Mr. Lawrence Jermain McParlin, of Lockport, N. Y., Greenback candidate for Associate Judge of the Court of Appeals, is a well-known old time telegrapher, and we are sure the members of the fraternity will wish him success. In 1866 Mr. McParlin entered the Western Union office at Lockport as messenger. In a short time he was appointed assistant operator. In 1869 he was appointed Manager of the Atlantic & Pacific office in Lockport; and in 1870 Manager of the same company's office in Buffalo, where his eyesight was somewhat impaired, when he resigned his position and returned as Manager of the company's office at Lockport at an increased salary, but in May, 1871, having saved enough money to carry him through a legal course, resigned his position and studied law. He is now practicing that profession in Lockport.

WORCESTER, Mass.—This office has experienced quite a number of changes within the past few months. Mr. Peter Van Allen, one of our best men, has resigned to accept a more remunerative situation in Boston. W. A. Hennessy, Jr., of New York, has been subbing here while the regular pressmen took their much needed vacation. During his stay, he, by the excellence of his work and the fineness of his "copy," obtained quite a local reputation, besides most favorably impressing the "typos." H. M. Breen, formerly of Boston, and A. D. Brewer, have but recently come among us. The rest of the force consists of P. J. Delahanty and P. J. Cunningham, day men; Wm. Cameron, night manager, and Wm. H. Wheaton, night press. Mr. F. N. Cook, in the absence of Mr. Ryder, is working the day press wire, and Manager E. W. Bradford directs matters as usual.

The Toronto *Truth*, in its leading editorial in the issue of Sept. 17, says some very pleasant things about Mr. H. P. Dwight, the recently-appointed manager of the Great Northwestern Telegraph Company, which that gentleman well deserves. It goes on to say that to Mr. Dwight's business energy, tact and perseverance, which have been conspicuous throughout his whole career, ever since he sent the first message over its wires, some twenty-five years ago, the success of the Montreal Telegraph Co. has been very largely due. He has been rightly styled the Father of Canadian Telegraphy. The successful career which Mr. Dwight has so long enjoyed, and the prominent position to which he has attained, afford another striking example of what ability, earnestness, perseverance, enterprise and good principle will do for a man not born to fortune, nor in any way favored by extraneous circumstances above hundreds of his fellows. No one, *Truth* adds in conclusion, can say of Mr. Dwight that he owes the position which he holds to-day to anything short of an ability and experience of a very pronounced order.

## BORN.

CUSHING.—Oct. 3, to Mr. H. H. Cushing, agent and operator at Keysville, Va., a son.

HAWKINS.—Oct. 9, 1881, to Ed. A. Hawkins, operator, W. U. Tel. Office, Indianapolis, a daughter.

## MARRIED.

WAFER—HOGAN.—Oct. 9, 1881, at the residence of the bride's parents, Mr. James T. Wafer, for many years operator at Petroleum Exchange, New York City, to Miss Mamie Hogan.

HILL—FIELD.—Sept. 17, at Philadelphia, by the Rev. John E. Johnson, Mr. Charles E. Hill, operator W. U. Telegraph Co., to Miss Lulu M. Field, both of Philadelphia.

# GILLILAND ELECTRIC MANUFACTURING CO.,

E. T. GILLILAND, General Manager, INDIANAPOLIS, Ind.

**STANDARD  
Magneto Bell.**

38,500 now in use.

This Secrecy Switch has many advantages over the old style. It can be attached to any or all of our Magneto Bells by a change in the connections and the addition of the Indicator, for in their construction this change was provided for. In all the Secrecy Switches heretofore made, it was necessary to turn the switch every time it was used, but with this latest improved, the Gravity Switch is employed. The Indicator controls the talking, and when set for the Exchange, no further attention is required until desired to talk in the opposite direction. When the Telephone is hung up, the line is restored for the use of others upon the same circuit, the Indicator simply governing the talking. Additional to the superiorities it possesses as a Secrecy Switch, it has an excellent feature in that all of our Bells can be converted from a Gravity to a Secrecy Switch, or vice versa, and provide for the possibilities of the Individual Bell in the future.

**SECRECY SWITCH.  
STANDARD MAGNETO.**

TEN-LINE COMBINATION SWITCH BOARD.

## 10-LINE and 20-LINE SWITCH BOARDS,

For the club system of small towns and villages.

INVALUABLE FOR

Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

**Infringements and Worthless Imitations.**

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

**The Leclanche Battery Co.,**

40 West 18th St., New York.

## A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## Kerite Insulated Wire and Cables A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

the Watch.

## HUNTING CASE WATCH IMITATION GOLD!

We now offer to the readers of this paper a first-class watch in every particular. Heretofore a low-priced watch has been the poorest of investments, being of no value as a time-keeper, and a constant source of annoyance and expense to its owner. The Watch we offer you is a marvel of accuracy and cheapness, and we are now, for the first time in the world's history, able to offer a low-priced, perfectly reliable Watch, suitable for use on Railroads, Steamers, and other places where accurate time is required. The annexed cut shows the exact size of the Watch; the movements are nicked and Swiss make, known the world over for their excellency and fine finish. The case is finished from a composition of metals so closely resembling Gold, that it is almost impossible for the best judges to distinguish the difference. It is the best substitute for Gold ever discovered and will stand the acid test. There is now a growing demand for just such a watch, and we propose to sell a limited number at a special low price, and we believe the vast army of Professional Men, School Teachers, Mechanics, Farmers and Laborers, will appreciate this bargain, and continue to purchase from us other goods, as shown in our Illustrated Catalogue.

**OUR GRAND OFFER!** In order to more thoroughly introduce our goods in the United States, we make the following unprecedented offer: Upon receipt of only \$7.00 and this advertisement, we will forward, all charges prepaid, and guarantee to reach you in good order, one of the above described watches, securely packed in a wooden case.

We can only send out a limited number of these watches at price named, and to protect ourselves from jewelers and others ordering in quantities, we will insert this advertisement in this paper but one time, hence, require you to cut it out and send to us with your order, that we may know you are entitled to the benefits of this offer. Under no circumstances will we sell more than one watch at above price to any one person, but if others are desired we will furnish them at regular catalogue price. Many of our agents sell this watch at from \$20.00 to \$35.00. We will mail you a catalogue at same time we send watch, and feel sure you will be so well satisfied that you will show catalogue and watch to your friends, thus assisting us in selling other goods of standard quality, which are manufactured from new and original designs, and which we guarantee to give satisfaction. We will be responsible for money if sent by Registered Letter, P. O. Money Order, or Draft made payable to our firm. We will send the Watch C. O. D. with privilege of examination, provided you send \$2.00 to guarantee us against loss by express charges; but if you send us full amount with your order, we will prepay all shipping charges and ship watch on day order is received. As to our responsibility, we refer you to any Bank in this City. If you do not order at once preserve this advertisement for future use. If you send us \$1.00 extra when you order Watch, we will send a handsome Watch Chain and Charm made from a composition metal resembling Gold.

## THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

### PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL

## PARTRICK & CARTER'S TELEGRAPHIC SPECIALTIES.

### THE "LATTIG" [AUXILIARY LEVER NON-STICKING] KEY.

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very *finely finished*, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the *indorsement* of the *best operators* in the country. It embodies the only true principle to *prevent a key from sticking*, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of *sticking keys*. We claim this key will never fail to make contact.

### "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY of BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

### The Giant Sounder Perfected.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

### Champion Lightning Arrester.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

### Premium Learners' Apparatus.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

DENNIS DOREN,

General Superintendent of Construction of the Western Union Telegraph Co., and President of the American Cable Co.

## Dennis Doren.

When Denis Doren put on his spurs (metaphorically) to climb the ladder of fame, in Wooster, Ohio, in 1850, he was but 18 years of age. At that time, even General Eckert (who had just abandoned his post-office for an ascent in the same direction) little dreamed that the encouragement he was giving this warm-hearted, muscular, ubiquitous workman would create a Marshal Ney for all his future Napoleonic telegraphic crusades.

The laudable ambition of young Doren, however, was not for prominence or position, but an earnest desire to obey promptly and satisfactorily the orders of his superior officers; a service which inevitably, and often unexpectedly, not only carries success with it, but also elevates the faithful subordinate. When Doren plunged through almost bottomless Western roads, hauled supplies over hundreds of miles of "corduroy" roads, swam unbridged rivers, and risked his life daily in his efforts to execute orders given him by his employers, in their mighty efforts to flank the O'Reilly lines in their Westward Ho! movement, he little realized the bright future that awaited him; and, in this respect especially, his example should stimulate every foreman, repairman, or construction hand in the telegraph service to-day, to renewed efforts in the honest and conscientious performance of their duty; to qualify themselves for their work by close application to it; to compare ideas and experiences with their fellow workmen, and ever to make themselves indispensable by loyal and expert labor.

Young Doren was from the first noted for his genial ways and unstudied affability, and these qualities aided him greatly as he shouldered his ladder ("spurs" were not then invented) and followed the fortunes of "the Wade lines" from 1850 until they formed the nucleus of the present Western Union Company. Doren's politeness and natural gentlemanliness, quick wit, ready repartee, a plastic memory for a good story, and a ready tongue to improve it in repetition, were his stock in trade, and have not only carried him through all the great telegraphic epochs of this country, making him a conspicuous part and parcel of it all, but find him to-day the most prominent; and certainly the ablest telegraphic engineer on this continent, with a greater number of devoted friends, and a wider circle of acquaintances in his own department than is possessed by any other living man.

In a late trip over the Blue Ridge, the writer, while discussing telegraphic matters with the hotel proprietor and the repairmen of those sections, at a remote inn on the mountains, was interrupted by the landlady, who came into the room exclaiming: "Pop! what was the name of that telegraph man that used to go through here and whom we all liked so well?" The old gentleman replied: "Why, Doren, of course!"—which is a fair illustration of Mr. Doren's personal popularity everywhere—a trait which, if not natural with telegraph or other public men, can well be cultivated, not only for the pleasure it is sure to bring the possessor, but for the service it will be to him and to the company he represents. Which of us cannot particularize some lineman, who, with this faculty, can secure the privilege of trimming treasured trees, acquire pole privileges, railroad facilities, livery service, hotel accommodations for his men, etc., where others fail? A man may leave such a reputation as the only legacy for his family without fear of their being disinherited.

Mr. Doren's earliest work, as has been indicated, was on the Wade lines, in Ohio, in their rapid expansion to all the leading Western cities. His efficiency was soon demonstrated, and he was no less active in constructing the new made lines than in taking down the old O'Reilly ones, when their requiem had been sung. Mr. Doren erected the first line on the best of Indiana railroads, the Indianapolis & Terre Haute Rail-

road, for President Peck, early in the '50s. He was also the pioneer in building the Lawrenceburg line, from Cincinnati to Indianapolis, receiving his first intimation that municipal authority must be recognized, by the City Councils of Indianapolis refusing permission to erect some beautifully shaved pinnacle-pinned poles that Doren had culled out and saved for a graceful termination to his second railroad line. The city authorities, however, compelled him to erect square or octagon poles. Doren bowed to the inevitable, and, by running an Ohio River saw-mill night and day, soon completed his work with octagon pine poles. The labor of changing the lines to railroads from the unfathomable roads in those States' fertile soil must have gladdened our youthful constructor's heart as his persuasive voice and commanding manner found new fields for conquest in the hearts of railroad officials, instead of stage-drivers, country landlords and the good old honest tillers of the soil.

Mr. Doren constructed the first line on the Ohio & Mississippi Railroad—Cincinnati to Seymour—little dreaming that the cross-tie walking of those days would so ably aid him when, in later years, in the A. and P. service, he should, without warning, precipitate 200 practical telegraph men upon the same road, in one of the boldest strokes ever attempted by an opposition telegraph company. His pioneer work then rapidly covered the railroads in Kentucky between Lexington and Frankfort—Kentucky Central, Lexington & Covington, Central Ohio, Bellaire to Columbus, and Ohio & Indiana (now the Pan Handle), and Steubenville to Newark.

When the war broke out in 1861 and Doren's brilliant chief was called to Washington, as a natural consequence Doren followed his fortunes, and to this hour has given Gen. Eckert most faithful and loyal co-operation in every telegraph step he has taken. The difficulties encountered in the erection of military telegraph lines no constructor of the present day can even imagine; and Doren's early experience in Hoosier mud roads was of great assistance in the adhesive clay of old Virginia. Here, with balky mules and stubborn drivers, express train time was expected. Careless artillery drivers willing to knock down all the poles that the mule corral failed to pull over; slow-marching soldiers compelling the construction corps to take their line in their hands and push the work beyond picket posts; mud, night and death appalling no one, were facts that were not calculated to make the service especially inviting, and yet, with such intrepid assistants as McBristal, Owen Boyle, Joseph Finnegan, Palmer Gulick and Harreycutte, he soon placed brigade, division and department in immediate and constant communication with the War Department.

While the important but inconspicuous part borne by Mr. Doren in the struggle may never be properly appreciated by the nation, it developed the man and united him to the telegraphic geniuses of this country, whose impress will be left upon the great commercial lever generations hence.

Mr. Doren's most notable escape during the war was at Cold Harbor, Va., with General Grant's army. The enemy had located General Meade's headquarters, and made it so uncomfortable that it was dropped further away and behind a protecting hill. During the change, however, the headquarter's telegraph line went down, and Doren, with his usual spirit of self-abnegation, instead of ordering some subordinate to take the risk, started out to repair the break. The Confederates sighted the big lantern upon his arm, and blazed away. Just after connection was restored, a minie-ball struck Charlie, his horse, and off he went at break-neck pace, almost into the Southern lines before he could be checked. Doren then got off and groped his way back through line after line of sentinels until, about daylight, he found his camp.

While laying the first cable—15 miles long—from Cherrystone, Md., to Fortress Monroe, in 1872, the new steamer *Hoboken* went down in a gale, causing the cable to be lost, and the crew and telegraph men to endure much privation before they were rescued by the *J. R. Spaulding*, and returned to Fortress Monroe. Doren was soon furnished another cable, and the day he started to lay it the iron-clad *Merrimac* made its devastating call in Hampton Roads. The cable was "rushed," however, and the next night

W. J. Dealy and Geo. Sheldon sent the joyful news over it that the *Monitor* had arrived and changed the history of this nation.

Later in the war Doren also laid a cable in the James River, from Fortress Monroe to City Point, 40 miles, to avoid the annoying interruptions the confederates were giving the land line. This was done at night, but the argus-eyed Southerners detected it, and in a few days Doren was ordered after a *ground* in the cable. After undermining and careful cutting he was able to get the proper section on deck and located the trouble. The cable had been taken up and a large awl forced through it, making a nice little aperture for the water to work its mischief. The cable was not further molested as the conflict deepened, and the Southern troops were driven further away.

After the war closed, Mr. Doren built new lines for the American Co. on the various railroads from Richmond to Gordonsville, Alexandria, Washington, Danville, Wilmington, etc., until Gen. Eckert was appointed General Superintendent of the Western Union Eastern Division, when Doren followed him to New York, and remained there, as Superintendent of Construction, until the General accepted the presidency of the Atlantic & Pacific Co. in 1875.

In this service Doren's old war experience was of great avail. No emergency ever arose that did not meet its master in him—whether in secretly gathering an army of telegraph men into Cincinnati without attracting attention, or even causing his men to be surprised; and unexpectedly hurling them out along the Ohio & Mississippi Road and almost covering it with a telegraph system before his opponents were aware of it, or whether in building 1,200 miles of line with two wires in 92 days, through most terrible rains, swamps and mud, from Louisville to New Orleans, Doren's push and contagious enthusiasm were ever omnipresent. The slow-going farmers through that section of the country will never forget "the lightning man" who could not wait until "next week" for their teams, but *must* have them "right now."

When the A. & P. faded like a myth, to give place to the wide-awake American Union organization, with its brave and dashing leaders, it was the most natural thing in the world to expect Doren's "white plume" to be shining in the front rank. The prodigious labor, mental and physical, performed by him in those active and trying days, and the magnificent lines he has left behind him, entitle him to the highest encomiums and perpetual rest. The latter, however, he will doubtless never take until his labors on earth are all ended. During his four years of military service he could only be persuaded to accept two weeks' leave of absence, while, in later years, he has forgotten what leisure is.

While crowding the magnificent new line on the P., F. W. & C. R. R., last winter, having rushed it through from Chicago with five hundred men with unparalleled speed, in the severest winter weather ever known here, the following dispatch was received and read to each gang, as they enjoyed their turkey dinner next day:

NEW YORK, Dec. 24, 1880.

To Mr. D. Doren, Gen. Supt. Construction, Mansfield, O.:

Say to the men that Mr. Gould, Mr. Bates, myself and all interested are grateful for their work and wish them all "A Merry Christmas." To yourself we send our hearty congratulations and good wishes.

THOS. T. ECKERT, Prest.

Mr. Doren was also the recipient of a superb gold watch, beautifully monogrammed "D. D." on the face, and the "battle shield" with the cabalistic A. U. T. on the reverse side, while on the inner cap was engraved:

"557 FIFTH AVE., N. Y., Dec. 25, '80.

Mr. D. Doren, Gen. Supt. Construction, Amn. Union Tel. Co.:

May I ask you to accept the accompanying watch, chain and seal, as a mark of my appreciation of your ability and integrity.

JAY GOULD.

The sardonyx seal bore the monogram "D. D." on one side, and *Puck* "girdling the earth" on the reverse.

Thus in an additional and certainly very pleasant manner, Mr. Doren realized that his travels of over 600,000 miles in the telegraphic service of this country were appreciated, and that "patience is bitter, but its fruit is sweet."

### The Telephone Inspector.

In the October 15th issue of THE OPERATOR appeared an advertisement bearing in large letters the unusual legend, "Inspectors Wanted." The company requiring the inspectors was the Bell Telephone Company of Missouri, St. Louis. The advertisement is a sign of the times, and furnishes a text for this article.

There are inspectors and inspectors; there are men who to a telephone or local telegraph company are worth any price—are worth their weight in gold, to speak hyperbolically, while there are others who are not worth their weight in "etheric force" or individual bells. A really good, able and industrious inspector can, even under very adverse circumstances, often get good work out of a bad system and worse instruments, and can keep subscribers at least passive.

But, on the contrary, a lazy, inefficient or, worse than all, a *careless* inspector can blight the fairest and most promising route of subscribers; can ruin the best instruments, without giving a week's notice, and can make the lives of the office manager and of all of his subscribers so ineffably miserable that, emulating the Brooklyn divine, they see no deliverance in this present world, and "even wish that they were dead."

If any remarks in this article should grate upon the feelings of such a one, let him congratulate himself, for in that case he is not irrecoverable—there is hope for him if he reforms at once. If similar remarks should, as "a bow drawn at a venture," hit any inspector who occasionally makes a mistake, but who, in the integrity of his heart, tries to do as well as he knows how and always is anxious to learn more, let him not feel hurt thereby; from such a one criticisms glance off pretty much as water does from the plumage of the swan.

Before the mind's eye of the writer passes a typical inspector of the "not thorough" class. Although meaning well all the time he rarely does well. He is called upon to attend to a complaint. This document is, of course, as lucid as the densest mud, probably couched in the impassioned words, "The d—d thing won't work." Our hero goes off whistling, with a heart as light as hydrogen, and presently arrives at his destination. He at once wins the heart of the subscriber with his cheery smile, especially if he hasn't been there before. After a pleasant word for every clerk in the store and a genial smile for the lady cashier, he takes the offending instrument in hand. He finds the bell box to be one with the attachment recently invented by Edison, Johnson, Anders, Gray and a horde of other professional inventors, whereby the old button for cutting in the generator to the line is rendered unnecessary. In other words, a bell box with "automatic shunt breaker." On testing it he finds that he can't raise the central office. Fully competent, he makes up his mind that as all seems to work properly the difficulty is, of course, that the shunt does not break. To get at the trouble he has to open the box, and discovers that he has left his bunch of keys in the keyhole of his drawer at the office. Misfortune the first. It will be remembered that this man is smart and able; his only trouble is thoughtlessness and lack of thoroughness. Therefore *because* he is smart, an idea flashes across his mind. He takes out his screw-driver, rapidly unscrews the line and ground wires, and the transmitter battery, and tries, by connecting one pole of the battery to the ground, and tapping on the other with the line wire, to drop the annunciator at the central office and attract the attention of the manager. Fortune favors the brave; the line is well insulated, the annunciator magnet well wound with fine wire, and the battery at its best, so he succeeds.

He gets the manager to send the keys down by a boy, and after the boy has come and gone and he has opened the box and detected the trouble, he wants his pliers. He hunts for them in every pocket, and at last remembers that he didn't have any occasion to use them for two days; thought he wouldn't to-day, and so, as they were a weight to carry about, he put them in his tool drawer early in the morning.

Ashamed to call again to the office, he, for want of the required tool, repairs the bell imperfectly, resolving to visit it again soon and then fix it properly. He then connects up the wires again, tests with the office, finds it works well,

and goes off, forgetting to re-cover the battery box, but not forgetting to fresco the carpet with ammoniacal salts and oxychlorides of zinc, which, while waiting for the boy, he had carefully peeled from the jar. He, of course, also forgets to go near that subscriber's office again to permanently repair the trouble, and in three days the same old difficulty is reported again. The subscriber, however, isn't so glad to see him this time, and, if another man be sent, he has to suffer for the fault of No. 1. But he goes on his way rejoicing, and is now on his regular beat. At one place he examines and tests bell, transmitter and telephone, but doesn't look at the battery. If he had, he would have found the solution low and the zinc eaten off and scarcely touching, and saved a complaint.

If he had done this, and had a zinc in his pocket—but this is opening too wide a field for conjecture, and we forbear. At the next place he fails to try the binding screws, and in a day or two a loose connection is reported on that line. At number four he remembers that Mr. Surly is not always pleasant, and he concludes that one miss won't matter. Ten to one it is all right, anyway. At number five he makes a thorough inspection and finds all apparently in good order, but he doesn't try the instrument to see if the talking is all right. If he did, he would soon find that Mr. B. hadn't paid his gas bill, and that his meter had that day been taken away, and so on *ad libitum* to the bitter end. This man never carries a full kit of tools. He trusts to luck that he won't want them. He never carries sal ammoniac or extra zincs. He always leaves something undone, and he wonders why Jack Earnest and Sam Careful always get ahead of him, when he is so many degrees smarter than they. Don't we know such men? It is well to emulate his smartness and shrewdness; but if you can only possess one good quality, let it be *thoroughness*.

We have seen the lazy inspector. It is not necessary to name him. He won't go out after four. He always takes a car, even if his destination is but half a block away. He makes it a rule never to do too much. "The company is rich, you know." His motto is, "Never do to-day what you can put off till to-morrow," and he acts well up to it.

He has a system. If he has a regular inspection route, he will have a little lottery with himself every day and draw cuts to see which house he shall *not* visit. He knows where all the free lunch counters are, and doesn't forget it. The telephones are always in good order at the saloons on his route, and he can always be found, because every boy in the office knows where he will be at every hour in the day.

There are, however, certain times when he has a rush of business to the head. These occasions are chiefly when an inspector is required to locate a line trouble, and there is only one besides himself in the office.

He need scarcely trouble to be busy at these times, however, since the manager probably knows that if he goes out on a line trouble, a snail's gallop would be two-forty time compared with his, and the other man will invariably be chosen.

We know another inspector who is as smart as our first specimen; who can do anything in the world with wires; who invented a button repeater before he cut his eye teeth; who can make a diagram quicker than Gerritt Smith can think of one; who is lightning on locating breaks, grounds and escapes; who knows every time, from the way a fault acts, what causes it; who is quick, sharp, careful, and who would be invaluable, provided he would consent to apply his talent for the company which pays him, and to his regular duties. Unfortunately, however, that is the one thing he won't do. If he should, he would be perfection. If he is wanted to go out and attend to a reported trouble, he will be found in the back room making an induction coil. If he starts out to locate a ground, he will have to stop when he passes the switch-board to explain to an aspiring young electrician why an annunciator placed in the common ground wire won't work. If he is wanted to relieve the manager for an hour, he can't be found, and upon anxious inquiry it is elicited that he has just stepped up to Tom Edison's new place, you know, to tell him that he has no chance against Maxim, except by stock-jobbing electricity. He can make wonderful shocking machines. He can make an electrical clock out of a battery-pole

changer. All the boys in the office regard him as the greatest man that ever lived, and the girls unanimously pronounce him "too smart for anything;" and so he is. He is valuable because he knows almost everything. He has a private contract with all of his subscribers, that he will have a regular day to come around; and, if the instrument don't work, not to complain to the office, but to wait and tell him. Of course, there can be nothing tangible against him, as he always covers well his tracks when he meanders from the paths of professional rectitude. He is handy, but there is a general impression that he is not reliable; and a standing joke goes round occasionally, when the manager wants the room where old apparatus and instruments are kept cleaned up, that all there is to do is to send Ed. Coilmaker into the room for a day or two, and it won't need any more cleaning.

We know another man who ought to quit the business. Although well-meaning and pleasant, he is simply the wrong man in the wrong place. He used to be a telegraph operator. He can handle a key with celerity, and, if necessary, can to-day copy twenty words behind; but he is not an inspector. Inspectors are born, not made.

If you send him out to detect and report upon the nature of a trouble, he will report an escape, when the trouble is a broken wire, and *vice versa*. He will have his superintendent put a steady battery on to aid him in locating an escape. He will rip out a transmitter, because the battery is dry, and report a weak magneto generator, when the trouble is a bind in the drop at the central office.

If he goes on the roof or into the cupola to change a pair of wires, he will probably connect one to the lightning arrester ground and the other to your most important extra territorial line.

He always connects the battery wires to the secondary coil of the transmitter, and includes the telephone in the primary. If he gets anything accidentally right, he is astonished, and so is everybody else. He has one excellent feature, however, namely, his unfailing good nature. He is not to blame, only he had better go back to the key, study law, or apprentice himself, while the lamp holds out to burn, to a tailor.

But while patiently considering these various typical inspectors, there is one who at length steps forward, modest and unassuming. He is one that the experienced manager delights to honor, and that honor takes the shape usually of extra and difficult work. If an inspector acknowledges himself beaten, John Springjack has to show him. If successive inspectors and linemen fail to find a swinging break or escape, John is called upon to do it, and does it.

When he goes on a complaint he looks over his tools first. If he has to work on carpets, he carefully spreads a newspaper on the floor. If he has to fix a battery, he will carry it into the kitchen. He will not leave a job till he knows it is done and done well; and when John pronounces it done, everybody knows it is done. He always examines and tests every part of the apparatus, and tests it thoroughly. He is wise in his day and generation, and when anything is working well he knows enough to let it alone. He tries every binding screw. He studies cause and effect. He doesn't have to learn a thing twice. If he makes a mistake, he thereby learns a lesson. If he is on a trouble, he won't leave it because it is 5 o'clock. He knows just as much about induction coils as the next man, but they doesn't trouble him in business hours, except when they are inside of a transmitter. When he walks the street he keeps one eye on the wires, and doesn't fail to report any defect he sees; and it doesn't take him a month of Good Fridays to get acquainted with the lines of his own employers.

A subscriber who has once seen him wants to see him again, and the linemen, who secretly hold inspectors in contempt, always like to be on a job with John.

He doesn't report a cross until he knows it is one. He doesn't report line open until he has tried the receiving telephone to speak with, and before rejecting a transmitter he will examine the battery and bell connections. In a word, he is thorough, and to all inspectors we say, *be thorough*, whatever else you may not be. A word to the wise is sufficient. It is probably the last class of inspector that the St. Louis company wants.

T. D. Lockwood.

## A MAGNIFICENT WORK.

POEMS OF WILLIAM WORDSWORTH. Edited, with an Introduction, by Richard Henry Stoddard. Elaborately illustrated. 320 pages. Cloth; gilt edges. New York: W. J. Johnston, No. 9 Murray street, 1881.

The increasing love of, and taste for, good literature, which has been manifested in the ranks of American telegraphers for some years past, has induced the publisher to supplement his previous works by a superb edition of a volume of Wordsworth's poetry. The sale of

"Christmas Evergreens," a fine collection of poetry, verified the apt saying that, among American telegraphers at least, Poetry may flourish beside Science—indeed that the two may go hand in hand. The tired slave of the key and pen goes home at night to rest his weary faculties, distracted with the cries of "bull" and "bear," the market prices and the everyday grind of a telegrapher's life, and what more solace can he find, next to that of his loving family, than a volume of good poetry? And of this latter what is there more tranquillizing to the mind, or soothing to the nerves, than to go with the Laureate through the grand old English lake region—one of the richest in antiquity in England—to stop, as it were, and converse with the simple-minded peasantry, to linger in the enchanting solitude of Grasmere, to view the "scarred summits of the hills, lulled by the four gentle rivulets which sing their way down past the yews to the full stream below, and to watch the butterflies, the creeping things, the luminous wild flowers, all joyful in the sunshine?" The humming and tired brain, the swimming eyes, the throbbing pulse, quickened by exacting and continuous labor throughout the day, find welcome rest at evening in the study and contemplation of Nature, as pictured by the Master, Wordsworth. The tired worker, laying down for an hour his load of responsibility and care, may, with the Laureate, in his "Evening Walk,"

"Rove  
Through bare, gray dell, high wood, and pastoral  
cove."

"Where hoary Derwent takes,  
Through crags and forest glooms and opening lakes,  
Staying his silent waves, to hear the roar  
That stuns the tremulous cliffs of high Lodore;  
Where peace to Grasmere's lonely island leads,  
To willowy hedge-rows, and to emerald meads;

Leads to her bridge, rude church, and cottage  
grounds,  
Her rocky sheepwalks, and her woodland bounds;  
Where, bosomed deep, the shy Winader peeps  
'Mid clustering isles, and holly sprinkled steepes;  
Where twilight glens endear my Esthwaite's shore,  
And memory of departed pleasures, more."

No matter how the critics may disagree with regard to the merits of Wordsworth, all are of one mind as to the fact that as surely as Columbus discovered America, Wordsworth discovered Nature, annexed her to Literature, and then proceeded to surpass Columbus' exploit altogether by inventing a new language in which to talk about the new conquest. In this, then, we believe that the publisher has made no mistake in presenting to the profession the present volume so ably edited.

The cut at the head of this article will give the reader an idea of the neat and attractive appearance of the book. It is elegantly bound in cloth, with a profusion of gold on the side and back and gilt edges, the present edition being intended principally for the holiday trade. It contains seventy-four superb engravings—all large, most of them being about full-page—some of which we present below, though, of course, they are much more handsome in the book, being very carefully printed on heavy tinted paper. Here, for instance, is a scene from the charming "Evening Walk:"

To him who has for years seen nothing but the bricks and mortar of a large city, and heard nothing but the hum and bustle of metropolitan life, how welcome must be the thought of

wandering fancy free in a "Saunter Through a Wood:"

"How sweet it is, when mother Fancy rocks  
The wayward brain, to saunter through a wood!  
An old place, full of many a lovely brood,  
Tall trees, green arbors, and ground flowers in flocks.  
\* \* \* \* \* Verily I think,  
Such place to me is sometimes like a dream  
Or map of the whole world; thoughts, link by link,  
Enter through ears and eyesight, with such gleam  
Of all things, that at last in fear I shrink,  
And leap at once from the delicious stream."

Who is there, weary of his load of toil and sorrow, that has not been captivated by Wordsworth's "Wishing-gate"—that gate in the vale of Grasmere, by the side of the highway leading to Ambleside, which, time out of mind, has been called the Wishing-gate, from a belief that wishes formed or indulged there have a favorable issue?

"Smile if thou wilt, but not in scorn,  
If some, by ceaseless pains outworn,  
Here crave an easier lot;  
If some have thirsted to renew  
A broken vow, or bind a true,  
With firmer, holier knot.

"And not in vain, when thoughts are cast,  
Upon the irrevocable past,  
Some penitent sincere  
May for a worthier future sigh,  
While trickles from his downcast eye  
No unavailing tear.

"The worlding, pining to be freed  
From turmoil, who would turn or speed  
The current of his fate,  
Might stop before this favorite scene,  
At Nature's call, nor blush to lean  
Upon the Wishing-gate."

"When, in the south, the wan moon, brooding still,  
Breathed a pale steam around the glaring hill,  
And shades of deep-embattled clouds were seen,  
Spotting the northern cliffs with lights between;  
Gazing the tempting shades to them denied,  
When stood the shortened herds amid the tide."

To the lover of rustic scenes there must be rapture in the living picture of inanimate nature, which will be found at the bottom of this page.

The editor has, with rare tact, performed a work which should add still more to his great reputation. There are about ninety poems included in the book, among them such exquisite pieces as "We are Seven," "To the Cuckoo," and "She Dwelt Among the Untrodden Ways." Nor does his theme stop with the shore. There are some splendid illustrations of maritime life, one of which we give on this page.

Matthew Arnold, speaking of the poetical performances of Wordsworth, very truly says that, after that of Shakespeare and Milton, of which all the world now recognizes the worth, they are undoubtedly the most considerable in our language from the Elizabethan age to the present time. Taking the roll of our chief poetical names, besides Shakspeare and Milton, adds Mr. Arnold, from the age of Elizabeth downward, and going through it—Spenser, Dryden, Pope, Gray, Goldsmith, Cowper, Burns, Coleridge, Campbell, Moore, Byron, Shelley, Keats (I mention those only who are dead)—I think it certain that Wordsworth's name deserves to stand, and will finally stand, above them all.

But this is not enough to say. I think it cer-

"This sea that bares her bosom to the moon!"

"——— I saw the sparkling foam,  
And—with my cheek on one of those green stones  
That, fleeced with moss, beneath the shady trees,  
Lay round me, scattered like a flock of sheep—  
I heard the murmur and the murmuring sound,  
In that sweet mood when pleasure loves to pay  
Tribute to ease; and, of its joy secure,  
The heart luxuriates with indifferent things."

tain, further, that if we take the chief poetical names of the Continent since the death of Molière, and, omitting Goethe, confront the remaining names with that of Wordsworth, the result is the same. Wordsworth has left behind him a body of poetical work which wears, and will wear, better, on the whole, than the performance of any one of these personages, so far more brilliant and celebrated, most of them, than the homely poet of Rydal. Wordsworth's performance in poetry is, on the whole, in power, in interest, in the qualities which give enduring freshness, superior to theirs. Wordsworth's poetry is great because of the extraordinary power with which he feels the joy offered to us in nature, the joy offered to us in the simple elementary affections and duties; and because of extraordinary power with which, in case after case, he shows us this joy, and renders it so as to make us share it.

The gentle Wordsworth takes us, as a true Nature-worshipper, to the floating island in Derwentwater, which appears and disappears periodically on the water, varying at different times from an acre to a few perches in extent; to the Haunted House of Armboth Fells, where wide-eyed peasants see a large dog swimming Thirlmere, welcomed by moving lights and ringing bells, and hear preparations made for a murdered bride, who still keeps there her ghostly nuptials; to the glen where is the scene of the somnambulist tragedy in which Sir Eglamore returns from afar only in time to find his disconsolate Emma perishing in this torrent; and even to the old seat beside the hazel tree in the garden at Dove Cottage, where he used to compose his poems.

It has been well said of Wordsworth that, in his human sympathy and benevolence, "it was his hope and aim to console, to bless, to uplift and to encourage hearts and minds;" and we believe that in placing this volume before our professional brethren the act will be fully appreciated, and that the sentiment will not be lost which places Poetry by the side of Science.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

Entered at the N. Y. Post-office as second-class matter.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, NOVEMBER 1, 1881.

Americans visiting Europe will find **THE OPERATOR** on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE OPERATOR

has now reached the highest place ever attained by any telegraphic paper, and it is considered only proper that it should celebrate the event by issuing a number which has never been equalled by any similar class journal, and which will probably never be eclipsed. It contains 36 pages.

A sample copy of the present issue is mailed free to every telegraph and telephone exchange in the United States and Canada, as far as we have been able to reach them. Our object in sending it is that non-subscribers may see what **THE OPERATOR** is like, and that we may secure their aid and co-operation in our efforts toward giving the fraternity a strictly first-class, independent paper, of which they may justly feel proud. We would ask every non-subscriber into whose hands a copy of this issue may fall to **PROMPTLY** send in his or her subscription, and also make an effort to get the subscriptions of at least one or two others to forward at the same time. The recent unprecedented increase in our subscription list has been met on our part by an immediate and even more than corresponding improvement in the paper, and it is hardly necessary to add that we shall conscientiously continue the same policy in the future.

We will mail **THE OPERATOR** to any address from the present time until **JANUARY 1, 1883**, postage prepaid, and address changed as often as desired, for **ONE DOLLAR**. Send in your subscription now, while you think of it. See advertisement of **THE OPERATOR** and of our books in another part of this paper; also low rates at which the paper and one or more of the books may be ordered together.

A subscription form will be found inclosed in each copy of this issue. Those wishing to order books as well as the paper can write the names of the ones they desire in the blank space between the order for **THE OPERATOR** and their own signature.

As there are in some places operators (at railroad and branch offices) who will not receive copies of this issue—which are only sent to the Western Union or other head office of each town

or city—the manager who receives a copy will confer a great favor by showing it (after he has read it and sent us his subscription) to all the operators in his own office, drawing their personal attention to the paper; and then sending the copy (after they have thoroughly examined it) to any other operators or others interested in the business there may be in his town or city. By collecting and forwarding their subscriptions, he may be able to get his own paper or some of our books free, and will, at the same time, render us a valuable service which we shall be glad to reciprocate. If all will do this (and it will not be much trouble individually) the present issue will completely cover the entire telegraph and telephone fields, and the increased number of subscribers will enable us to still further enlarge and improve the paper. Let every manager enter heartily into the spirit of this suggestion and do his share toward making **THE OPERATOR**—if it is not so already—by all odds the best professional or class journal in America. After sending away your own copy, if you want another of this issue to keep let us know, by postal card or when you send in your subscription, and it will be at once mailed you.

Present subscribers, who may receive more than one copy of this issue will please use it or them in getting us as many new subscriptions as they can. Now is the time to “strike while the iron is hot.” As a copy of this issue goes to every office, there ought to be no trouble in securing subscriptions. We would particularly ask our friends to send their copies of this issue, after reading them, to such operators in their towns or cities as may be in branch or railroad offices and would not be likely to see a copy addressed to the manager of the Western Union office. We will supply extra copies to those saving the numbers who may send theirs away in this manner. Extra copies will also be mailed free for use as samples in getting up clubs, or to supply any offices which we may have been unable to reach.

### DENNIS DOREN.

We publish to-day, with great pleasure, the story of the long life of alternations of triumph and defeat—mostly triumph—of Mr. Dennis Doren.

Mr. Doren's career, besides being extremely creditable to himself, is also a credit to General Eckert, as may be seen by a perusal of our interesting narrative. The General, who seems to possess in an eminent degree all of Beaconsfield's and Palmerston's strange secret of selecting clever young men from the vast crowd around them, and of never allowing a promising young recruit to go into the camp of the enemy, has particularly vindicated this foresight in the life of Dennis Doren.

It has been well said that all great men are good natured, and of this theory Mr. Doren is a conspicuous example. With him nothing has been permitted to lie fallow, and his heart has always been in his work, to which to-day some of the staunchest lines in the country bear testimony.

He stands now as one of the great leaders of the telegraph against whom the first breath of suspicion has never yet blown, and the story of his telegraphic life may awaken in many the most grateful recollections of the kindness, courtesy and energy of Dennis Doren.

### WHO IS TO THROW THE FIRST STONE?

It has been said of the Telegraph that it was to be the great promoter of Peace on Earth, but, if the future historian must judge by this number of **THE OPERATOR**—a journal which, as everyone understands, has from its foundation pursued the rather uncourtly plan of caring for nothing but Right and Truth—the Telegraph will appear to him as essentially the great promoter of Discord. This is, however, acknowledged to be the great age of publicity, and as publicity is one of the first principles in the efficient administration of a great telegraph company, the painful duty devolves upon the conscientious telegraphic journal of holding up real and alleged abuses to public inspection, and of invoking public opinion upon them, rather than that of expressing our own opinions.

The grave charges of corruption, lying and theft made by the officers of the Mutual Union against certain officers of the Western Union—which are reported in another column as fully as our space will allow—are either true or not true, and the members of our profession at large, with their usual detestation of wrongdoing, may judge for themselves. But, true or not true, one side or the other—since both cannot be right—is convicted at once of being totally corrupt and utterly devoid of both common sense and common decency; and the principle is fully established that all the virtue, all the keenness of perception and all the impulses of honor are not confined to the so-called higher ranks of our profession.

In judging of the merits of this question, the operators of both companies should remember that the interests of subordinate and chief are forever identical—they must succeed or fail together—and that there is certainly no room for the officers of one company to point with Pharisæic pride to the short comings of the other set. We should make due allowance for the necessities of the situation, and respect all the official rules, traditions and other environments under which these men have been acting. If then they have acted within these bounds, calumny, which is but the breath of the wind—and all public men may expect it—can never hurt them. It must fall from the armor of their honesty like water from the back of a duck. Let their characters be thoroughly understood.

We have always regarded Gen. Eckert, with his stately presence, the natural courtliness of his manner and his personal dignity, as the incarnation of candor, honor and chivalry—strong and sturdy as an oak in his dislikes, and liking nothing that is bad; ever found with a generous heart and a full hand; built in body and mind to last, and lasting to work and triumph, and possessing to the full qualities which would bring him to the front in any profession. It is hard to bring ourselves to believe, therefore, that this strong, manly man, who for twenty years has wielded supreme power among his fellows, leading always by the sole right of intellectual power, has compromised himself in a petty, everyday “job;” that all this great strength of will, this extensive knowledge of the world and this great and cherished reputation have been pros-

trated before a private detective. We are reminded that the General has made no direct reply to the charge; but we prefer to believe that, whatever his reason may be for comparative silence, that strong physique of thew and sinew and of brain denotes too much courage to permit him to shrink for a moment from a responsibility of this kind, "even though it blast him."

Mr. D. H. Bates, fair and flowery, and pure—that is, the purity of the unsophisticated, who has never before been tried in the alembic of temptation—should withstand the fierce light that beats upon a throne equally as well as General Eckert. His doe-like yet (paradoxical as it may seem) conquering nature; his memory like an encyclopædia, and his rare intellectual gifts surely never yet led him so low as to "deal" with irresponsible clerks. Far excelling in worldly success all his contemporaries in age, his career has no parallel in telegraphic history. We believe him to be an amiable gentleman who by his fidelity and sheer pluck has surmounted all difficulties and worked his way upward, step by step, from an obscure railroad station, at Altoona, Penn., to one of the highest telegraphic positions in the land, being now barely thirty-eight years of age, and having been a superintendent of one of the largest Western Union districts at the age of twenty-four. Having looked with admiration upon his well-won and well-worn honors in the past, we have naturally looked to him for honorable and brave service in the future.

We believe that when the inside history of this unpleasant matter shall be known, it will be found that, as in many other cases, the principals on both sides have been imposed upon by middlemen and professional go-betweens—at least we hope so, for the honor of the telegraph profession.

THE charge made by Secretary Peck that the officers of the Mutual Union now hold \$250 belonging to the Western Union, which sum was paid by the latter company to a clerk of the former company to bribe him to commit petty larceny and breach of trust—in fact to lie and steal—is, to say the least, very embarrassing. We would suggest, as the easiest way out of the dilemma, that they once more bring forward that great George Washington of sunny Italy, Giovanni Purissimo Morosini, as they did in a similar emergency last spring. Let him enter a court of law of his country (if he has yet acknowledged America as his country) and, with uplifted hand, solemnly swear before his Maker that his name is Giovanni, not George; that he is a crony of Jay Gould's; that Jay Gould never possessed \$250; that the Western Union never earned \$250; that no such sum was ever paid; that he never drew any salary, and that this tall swearing is purely voluntary on his part. This would settle the matter, since everyone believes Giovanni. It was the great Mr. Jefferson Brick who exclaimed in great ecstasy: "This is a great country," but even he would admit that, in these matters, Italy takes the cake.

THAT strong Western Union Directory turns a bold front to the forthcoming opposition, and it behooves the latter to work still more persistently and vigorously. The old board represented a controlling interest in the Union Pacific, the Wabash and the whole Southwestern system. Since being strengthened by the addition of C. P. Huntington, President of the Southern Pa-

cific, Central Pacific, Chesapeake & Ohio, and virtual master of about 6,000 miles of road; George B. Roberts, President of the Pennsylvania Railroad and manager of 8,000 miles of railroad; Samuel Sloan, President of the Delaware, Lackawanna & Western and one or two other railroads; Amasa Stone, one of the strongest men in the Lake Shore road, and Chauncey M. Depew, who may stand as Mr. Vanderbilt's representative, it is clear that the twenty-nine men composing this strong directory can dictate the policy of the majority of the railroads of this country.

SHOULD the Postmaster-General, in his forthcoming annual report, recommend, as he is reported to contemplate recommending, the adoption of a Postal Telegraph system in this country, he will find himself about as lonesome as his predecessor was, who made a similar recommendation. The companies will require at least \$160,000,000 for the patents, good-will of the business, lines, instruments and buildings. Beyond the great expense there lies the fundamental American doctrine that to engage in the business of telegraphing is not a legitimate function of a republican government. The people of the United States are quite competent to manage their own business, and their common sense rejects any such absurd job as the attempt to establish a government monopoly of the telegraph, so long, at least, as the present "spoils system" is a recognized factor in our politics.

INDEPENDENTLY of the natural course of law in the case of those men arrested in New Jersey for chopping down poles, we hope that the matter will be fully investigated by the employers of the accused men. This course should be taken both for the protection and thorough vindication of the accused and for the honor of the Western Union Telegraph Company. If the men be proved innocent, their traducers should in turn be pursued with all the rigors of the law; but if any officious, over-zealous and unprincipled blackguard has been taking it into his head to devastate other people's property in that manner, we hope to see General Eckert come down upon him like a land-slide, and that afterward he may be left to the tender mercies of Jersey justice.

WE are pleased to see our esteemed London contemporary, the *Electrician*—which hitherto seemed never so happy as when referring incidentally to our "intensely pictorial" American contemporaries—going into the picture business too. In its issue of Oct. 8, it presents its readers with a very creditable engraving of the late Col. Thomas George Glover, of the Royal Engineers (Bengal). We have found the idea very acceptable to our readers, and the *Electrician* will reap its reward in increased popularity by making its countrymen of our mystic craft better acquainted with each other through the medium of intense "pictorialness."

WITH regard to the subject of increasing the hours of labor for operators, it would be well for telegraph managers to remember that in March, 1871, William Orton, President of the U. S. Telegraph Company; E. S. Sanford, President of the American Company, and J. H. Wade, President of the Western Union Telegraph Company, in response to a letter of the Postmaster General, asserted that "six hours' continuous service (steady telegraphing) is all that a young man is capable of performing and maintaining his health." The average official's idea of an

operator's endurance seem to have been revolutionized since that time.

It must be gratifying to American scientists to learn that at the Electrical Exhibition the Americans carried off a very large number of the prizes, considering the relatively small number of American exhibitors. The distinguished recognition given to the merits of Mr. Thomas A. Edison should be particularly gratifying to him and his countrymen; for, while Mr. Edison has been the subject of much derision—and, in many cases, not unjustly—he has, in this case, by his perseverance and public spirit, fairly earned all that has been awarded to him.

THEY seem to have some "grasping corporations" in France, as well as in America, for, when the announcement was made at the Paris Electrical Exhibition that a Diploma of Honor had, by some unseen and mysterious forces, been awarded to the Paris, Lyons and Mediterranean Railway Company, an organization notorious for its bad management, the interesting news was "greeted by ironical laughter and a perfect storm of indignant protest." No American pole-chopper received even honorable mention.

THIS season of the year is remarkable in our history for great losses of telegraphic property by fire. The 10th inst. will be the anniversary of the big fire in Boston, an occurrence apparently so recent that few of the older operators will realize that nine years have elapsed since then. A year earlier the great fire at Chicago swept away many telegraph offices in that city and some hundreds of miles of wire. One year ago, Oct. 24, 1880, the central telegraph office at Manchester, England, and the whole telegraphic system in that city were destroyed by fire.

THIS issue of THE OPERATOR, consisting of 18,000 copies, requires eighty-two reams of white paper of 500 sheets each, or in all 41,000 sheets of paper, 26x40 inches in size. Forty thousand sheets—to make it round numbers—40 inches long, will reach, in a straight line, 1,600,000 inches—that is, 45,000 yards, or 25½ miles. Double this, as the paper is printed on both sides, and we have, in a straight line, three columns abreast, fifty-one miles of reading matter for the profession, or one printed column 153 miles long.

PEOPLE are expressing surprise at the action of the Gould party in "permitting" President Green and other old Western Union officials to retain office for another year. There may be a key to the mystery in the fact that, although Mr. Vanderbilt is "out" of Western Union, his interests are not likely to be badly "left" while he retains in the directory such able lieutenants and staunch friends as Chauncey M. Depew, Augustus Schell and Edwin D. Worcester.

THE practice of changing Signal Service officers from station to station, for no other reason than the senseless one of preventing them from contracting any local attachments, has wisely been abandoned. There is no reason why "local attachments" should be any more demoralizing to a Signal officer than to a telegraph operator, and the abolition of the costly and altogether useless practice is to be commended.

WE learn from the *Mexican Two Republics* that Gen. Grant's project for a submarine cable from Havana to Progreso will come before the Mexican Congress at the present session; and

will probably meet with ready approval. From Progreso Gen. Grant will run a line overland through Yucatan across the Isthmus of Tehuantepec, and then a cable down the coast by way of Aspinwall to Brazil.

READING the allegations of Secretary Peck against certain officers of the Western Union brings to mind the question which Lord Cochrane asked of Lord Nelson concerning naval tactics, and the latter's reply that he knew very little about the subject; his general idea was that he had to get his ship as close as possible alongside of an enemy's, and that he believed he could not go very far wrong on that tack.

ONE year ago, in speaking of the projected Electrical Exhibition at Paris, we suggested that preparations should be made for a similar exhibition in this city at some subsequent date. The idea has been adopted by our English cousins, and the result will most likely be a successful exhibition of electricity at the Crystal Palace, London, in December next.

MR. EDWIN D. MORGAN, who has just been nominated and confirmed as Secretary of the Treasury of the United States, and has declined that distinguished honor, is a gentleman who has been always intimately connected with the telegraph, and is at present one of the Directors of the Western Union.

WE regret to announce the sudden death of Mr. Charles Howard, the publisher of the *Scientific American*. Although only thirty-one years of age, Mr. Howard had earned a wide reputation for keen perception and general business ability, and was justly counted one of the most promising of the younger men in the journalistic profession.

A MAN was paralyzed by a stroke of lightning at Highwater, Minn. Some local electricians reasoned that if earth would receive electricity from the buried end of a lightning rod, it would in the same manner draw out the charge with which they supposed him to be filled. Therefore they dug a hole and covered him up to the chin. He died, of course, in that position.

FIVE hundred pages of THE OPERATOR, tightly pressed, make one inch in height. This edition of 18,000 copies, 36 pages to each copy, makes 648,000 pages—a pyramid, one placed upon the other, 108 feet in height—higher than many of the church steeples in the city.

OUR gratuitous advertising of the Toledo Telegraph School has not been without fruit. The last number of the *Railroader* jauntily says: "October 1st, on account of a press of other business, Mr. Case withdrew from the Toledo Telegraph School." We congratulate Mr. Case.

THIS edition of THE OPERATOR—40,000 sheets, 26 by 40 inches—laid in a square, side by side, would cover a surface ten miles each way—100 square miles.

IT is now thirty years since, Nov. 13, 1851, the first submarine cable—that between Dover and Calais—was opened to the public.

TO-DAY we issue 18,000 copies of THE OPERATOR, of thirty-six pages each—648,000 pages of printed matter.

THE Gould Atlantic Cable, which really worked only forty-eight hours, is still broken.

## TO THE JUNIATA.

[In reviving old war memories, in our sketch of Mr. Doren, the following poem, by an old war operator, seems to be peculiarly applicable. It was composed by David Strouse, one of the four operators who, including D. H. Bates and Richard O'Brien, formed the nucleus of the U. S. Military Corps. Mr. Strouse's labors were too much for his strength. He returned home to Pennsylvania and died of consumption. A few days before his death, while seated on the bank of the Juniata River, near his home, he composed the following lines]:

### TO THE JUNIATA.

Gentle river, ever flowing,  
Where my early days were passed,  
Like thy waters, I am going,  
Sadly to the sea at last.

To that ocean, dark and dreary,  
Whence no traveler comes again;  
Where the spirit, worn and weary,  
Finds repose from grief and pain.

O'er the world I long have wandered,  
Now a stranger I return;  
Hope and health and manhood squandered,  
Life's last lesson here to learn.

Sadly on thy banks reposing,  
I am waiting for the day,  
Whose calm twilight softly closing,  
Bears this trembling soul away.

## Review of the Past Two Weeks.

A sensation was produced in telegraphic circles on Wednesday last, by the following open letter being received at the Western Union headquarters:

EXECUTIVE OFFICE OF THE  
MUTUAL UNION TELEGRAPH COMPANY, }  
NO. 41 PINE STREET, NEW YORK, Oct. 19, 1881.  
TO THE PRESIDENT AND DIRECTORS OF THE WESTERN  
UNION TELEGRAPH COMPANY:

We have in our control and now on special deposit in trust for the Western Union Telegraph Company three fifty dollar United States legal tender notes, numbered as follows: Y 49,067, series of 1869; E 175,733 and E 321,772, both of series of 1874, and one one hundred dollar United States legal tender note numbered A 80,153, series of 1878.

These notes, being in all \$250, were paid by certain officers and directors of the Western Union Telegraph Company (the hundred dollar bill having come directly from the treasury of that company) to a clerk in the employment of the contractors building the lines of the Mutual Union Telegraph Company, to induce him to take from his employers, for the benefit of the Western Union Telegraph Company, certain documents and extracts from documents which it was hoped might be used to the injury of the Mutual Union Telegraph Company.

We have also an original letter of Erastus Wiman, of the firm of Dunn, Wiman & Co., one of the directors of the Western Union Telegraph Company, directing the payment of the money to the clerk, and requesting that one of the documents thus to be obtained from him should be delivered to the general manager of the Western Union Telegraph Company; also the receipt of Thomas T. Eckert, the General Manager of the Western Union Telegraph Company, for the paper delivered in pursuance of Mr. Wiman's request, which receipt discloses upon its face a knowledge of the source from which the paper was obtained; also a memorandum in the handwriting of D. H. Bates, Assistant General Manager of the Western Union Telegraph Company, specifying certain additional information which the clerk was expected to procure; also an autograph letter of Erastus Wiman offering to provide the clerk with a situation at a salary of \$1,000 per annum in the event of his losing his present situation, and we are credibly informed that the assurances of this letter were verbally confirmed in the strongest manner by Mr. Eckert and Mr. Bates.

How far this conspiracy has extended we, of course, cannot positively know. The list furnished by Mr. Bates implies the necessity of suborning confidential clerks in the office of the Mutual Union Telegraph Company, but before it shall be carried any further we make this appeal to the governing body of the Western Union Telegraph Company that it be stopped.

If the persons named are so useful to the Western Union Telegraph Company that their services cannot be wholly dispensed with, we respectfully request that their zeal be restrained within the limits of common honesty, and that in their efforts to break down the Mutual Union Telegraph Company they shall not be allowed to break down all the rules of morality and business honor and all sentiments of fidelity and loyalty in employes toward their employers.

Permit us to remind you that the Western Union Telegraph Company is engaged in a business which

makes its employes the repository not only of papers relating to its own transactions, but of the business and domestic secrets of thousands of others. Such a corporation should be the last to engage in corrupting the clerks of others.

We respectfully request that all of the papers relating to our affairs which have been procured in this dishonorable manner be returned, and that hereafter the opposition to this company be limited to an honorable rivalry.

The very high character of the large majority of the directors of the Western Union Telegraph Company, and the relations which they sustain to the other great corporations of the country, give us every confidence that they will not, even by their silence, appear to approve of this conduct of their associates.

The \$250 will be returned when application shall be made for it and a proper receipt given.

In conclusion, it should be said that the value or importance of the documents obtained in the manner stated is no part of the issue between us. It is the method by which they were procured that is alone the ground of our objection and protest.

By order Executive Committee,

C. F. PECK, Secretary.

This letter was sent registered through the post office, to each director of the Western Union, which, of course, necessitated their signing a receipt for it.

It fell like a thunderbolt among the Gould people. Mr. Erastus Wiman, who is thus charged with trying to "compete" with a rival company by corrupting its clerks, will be remembered as one of the newly elected members of the Western Union Board of Directors. He expressed himself as "perfectly thunderstruck," as, in fact, he must have been. Gen. Eckert acknowledged having received a copy of the communication, but declined to say anything whatever in regard to the matter. He refused to affirm or deny the correctness of the statements.

Mr. D. H. Bates, bland as ever, said, "I have not received any such communication and I have not heard of its existence until now. I know nothing about it."

Other prominent officials expressed a similar degree of ignorance and innocence, it being the general impression that the letter must have been written by that One Man in Charleston, or some other wicked party. It was rumored late in the day that that great exponent of Truth, Mr. Giovanni (not George) Purissimo Morosini, had been carried home in a blanket by four able-bodied line-men, so shocked were his sensibilities at this apparent exhibition of epistolary depravity.

Under the pressure of public opinion something had to be done, and the duty thereupon devolved upon Mr. Wiman of wriggling out of it in some way. At first he said there was "not a shadow of truth" in the letter. Then he said he *might* have written so and so; and then, regarding his alleged effort to bribe a clerk, he said (interview in the New York *Herald*):

"When I come to think of it, I am not sure but I am able to rightly conjecture the origin of the offer of a \$1,000 position to a clerk. In the brief time I have been director I have received many applications for positions. Mr. Martin, of the firm of Messrs. Satterly, Bostwick & Martin, wrote to me for a phonographer. Having heard through my own phonographer of a young man wanting such a place, I wrote to the latter that he could have the place, and that the salary would be \$1,000. This possibly may be the foundation of this part of the story."

Subsequently, Mr. Wiman published a reply, taking the responsibility for writing the letter upon himself, giving his reasons therefor, and absolving General Eckert and the other officers of the Western Union from all connection with it.

The full text of Mr. Wiman's letter is as follows:

NEW YORK CITY, Oct. 20, 1881.

Dr. Norvin Green, President W. U. Telegraph Co.:

DEAR SIR: The Mutual Union Telegraph Company has published a letter to your company containing averments in which I am involved, and in which the attempt is made to connect your company with certain personal transactions of my own.

The simple fact is, that having been for many years interested in Canadian telegraph matters, and being now president of an organization which embraces all existing lines in Canada, I was naturally concerned at the proposition of the Mutual Union Company, under the guise of the Canada Mutual Company, to add to the number of telegraph lines in the Dominion, already more than sufficient for the wants of the public.

I found, also, reason to believe that the proposed line was about to be constructed under a contract of such a nature that, if its provisions were fully and certainly known, no such subscriptions would be made as were necessary to enable the new line to be built.

At this time a person not connected, either with the Mutual Union Telegraph Company, or with its contractors, voluntarily offered to procure me a copy of the contract. Such contracts in England and Canada are public property, invariably accessible to all subscribers to the funds of such companies, who certainly have everywhere a right to know the terms on which their money is to be paid out. I was at the same time an owner of stock in the Mutual Union Company, and was entitled to know its affairs. Friends of mine, moreover, who were large subscribers to the bonds of that company, had in vain endeavored to learn upon what terms the lines of the company were being built.

Under these circumstances, I agreed to pay the person who had offered me the copy of the contract for such a copy, without inquiring as to where he got it. I desired to take it to Canada with me, and he did not deliver it in time; but just as I was leaving on the train he sent me a note stating his inability to deliver it at the time, and asking where it should be sent. I then sent him written instructions to take it to General Eckert, and ask him to pay for it and hold it until my return. It was so taken to General Eckert, who simply signed, without scrutiny, a receipt handed to him with the paper. The payment was made for my account, and afterwards repaid by me.

In receiving and paying for the paper, General Eckert merely did a friendly act for me in my absence, and without any previous knowledge or acquaintance with the matter whatever.

As for Mr. Bates, his connection with the affair was simply this: He was asked by the party to examine the paper after it had been delivered to General Eckert, in his presence. He did examine it, and seeing that the copy of the contract failed to disclose several features ordinarily exhibited in such paper, as, for instance, the security for its performance, who were the custodians of the money and securities, and the amount of securities issued, made a memorandum of these points. This information, with the copy, was afterward delivered to me. No paper of the Mutual Union Telegraph Company is, or has been in the possession of your company, so far as is known to me, and none is, or has been, in my own possession, unless the copy of the contract which I have can be so considered, and to which I believe myself to be fully entitled.

Yours, very respectfully,

ERASTUS WIMAN.

The contract spoken of is then made public. It bears date April 14, 1881. The parties to it were the Mutual Union Telegraph Company, and John G. Moore and Thomas C. Purdy, partners under the firm name of John G. Moore & Co. This firm agreed to build telegraph lines of the aggregate length of 13,000 miles, with an average of four wires, as good as the lines of the Western Union Company; to procure rights of way and all other privileges, including patent rights; to establish and equip offices; to pay expenses of litigation, interest on the company's bonds for three years not exceeding \$300,000 a year, and to advance money for working expenses for three years, to be paid out of the first earnings of the company.

For these and other services the company agreed to pay John G. Moore & Co. the sum of \$14,000,000; \$4,500,000 in six per cent. bonds and \$9,500,000 in stock at par. The firm was required to give a bond of \$500,000 for the faithful performance of its agreement.

Upon reading Mr. Wiman's "explanation," Mr. Peck, the Secretary of the Mutual Union, said:

"Everything we stated in our letter we intend to prove. As to Mr. Wiman's epistle, it is a fabrication from beginning to end, in fact, an afterthought, bosh and nonsense. I can even go as far as to say that his assertions are wilful and deliberate falsehoods. We have not only the letters in our possession, which he yesterday denied ever having written, but we also have three witnesses to prove that those letters are authentic. Two of the witnesses saw Wiman write the letters, and the third one heard him relate the entire story of the transaction. So, you see, he hasn't the smallest loophole of escape."

On the following Monday (24th) the Mutual Union sent a long communication covering nine printed sheets and signed by the secretary, as below, to the directors of the Western Union. It refers at length to the above reply of Mr. Wiman, and says:

Having made these charges, we deem it our duty to you to produce the evidence, which to our minds conclusively proves:

First—That Mr. Erastus Wiman personally arranged for bribing a clerk in the office of the contractors; that he directed the money to be paid to the clerk with full knowledge; that in this way the document was to be surreptitiously obtained; that before the exposure he expressed his anxiety lest the matter might come to light and he and his associates be thereby disgraced.

Second—That Mr. Eckert, vice-president and general manager of the Western Union Telegraph Company, and Mr. Bates, his assistant entered heartily

into Mr. Wiman's scheme, approved of it and aided in carrying it out.

Third—That all three were doing this in the interest of the Western Union Telegraph Company and in their zeal for its service.

The charges are then taken up in their regular order. Discussing the question of Mr. Wiman's personal guilt, the letter refers to the fact that the affidavit of Benjamin M. Plumb (formerly associated with General Eckert and Mr. Bates in the American Union, now president of the Fabric Ornamenting and Manufacturing Co.), which is annexed hereto, recites that Erastus Wiman called on him at his office and asked his assistance in procuring papers of the Mutual Union Company; that he agreed to pay well a clerk in the office of the contractors whom Mr. Plumb said he knew, if he (the clerk) would procure a copy of the contract for him. Mr. Plumb, in his affidavit, details the fact that numerous conferences of the same tenor followed this one, during which the name of Henry G. Fearing was used as the clerk to be bribed. He explains that on a certain day when Fearing was expected to get hold of the paper, Mr. Wiman sent a stenographer to his (Plumb's) office for the purpose of making a rapid copy of the document, which, however, was not then available. At another interview he says Mr. Wiman gave him three \$50 bills to be paid to the clerk for his treachery, and an autograph letter, of which the following is a copy:

HENRY G. FEARING: Mr. Plumb says it may be necessary for you to change your location and may want employment. As I understand you are a good phonographer, I may want a party, and if you get out of employment you may count on me for employment at least \$1,000 per annum.

DUN, WIMAN & CO.,  
ERASTUS WIMAN.

NEW YORK, Oct. 13, 1881.

Mr. Plumb says further that he explained to Mr. Wiman how the clerk would get possession of the paper, telling that he had possession of the keys of the safe on Saturday, when the cashier of the firm was ordinarily out of the city, and that he would have to purloin it from the safe to get a copy of it. "Mr. Wiman," he adds, "acquiesced in this, and said it was of the greatest importance to his company, and to offer the clerk more money than the amount before stated, if necessary, to get the document." On October 13 Mr. Plumb says he sent the following note to Mr. Wiman:

NEW YORK, Oct. 13, 1881.

Personal.

DEAR MR. WIMAN: I have seen "Fearing" and shown him your letter offering him employment. He is all right and has got the copy of the contract all complete, but insists that as he stole it he is running great risks, and now wants more than the \$150 you gave me to give him. The fact is, his cupidity has been excited by the newspaper talk about this matter, and he now wants \$250. Shall I give it to him? and what shall I do with the contract when I get it? Hastily yours,

B. M. PLUMB.

This letter, the affidavit continues, was delivered to Mr. Wiman at the Grand Central Depot, as he was about to take the train for Montreal. After reading it he wrote the following reply and handed it to the messenger for delivery to Mr. Plumb:

DEAR P.: Give him the \$250 after he has read it over to you, if you find it very favorable to contractors. Perhaps it isn't worth it. I would go the \$250 if you like. Keep it till I come, or hand it to the Gen'l.

E. W.

The letter of the Mutual Union's secretary, after reciting the fact that the messenger who delivered these notes read them both and now makes affidavit as to their correctness, says: "These two notes convict Mr. Wiman of nearly all that we have charged, and show the falsehood and weakness of his pretense that he did not know how the papers were to be procured." At a subsequent interview between Mr. Wiman and Mr. Plumb, at which a stenographer was present as a witness and took a verbatim report of what was said, the following remarks of Mr. Wiman are detailed:

Tell Fearing he need not be alarmed at all, to stay where he is for a long time to come; that there is lots of money he can make by remaining there. \* \* \* There are several other documents which are very important, and which we want him (Fearing) to get, if possible. (Then follows an enumeration of the desired contracts, specifying particularly the one between the Mutual Union Telegraph Company and the Baltimore & Ohio Railroad Company.) Tell Fearing he shall be kept in the background all the time, and

need never come forward to be known in this matter if he works properly. We will get these Mutual Union folks on the rack yet.

Mr. Plumb states that he questioned Mr. Wiman as to how Mr. Eckert and Mr. Bates regarded the stolen paper, and he replied:

"Oh, they regard it as a big bonanza. You and I never did such great work as we have done in this matter. It is perfectly marvelous work, performed in so short a time. But we must be very careful. The Western Union folks are anxious that we shall not be disgraced in this matter. \* \* \* I wish, Mr. Plumb, you would arrange so I could substitute another letter for that one Fearing has got. I don't want it on your heading of paper, and I want it written carefully."

"I wrote that letter very hurriedly, and I am afraid I was not guarded enough in its statements. There is no use running deep risks where they can be avoided. Suppose he should drop the letter and it should be found by other parties, it would hurt us."

The letter next considers the question of the complicity in the matter of Messrs. Eckert and Bates, both of whom, he charges, knew as much about it as Mr. Wiman. In that part of his affidavit relating to these gentlemen, Mr. Plumb says that he discussed with them the best way of making the payment of the extra \$100 demanded to Fearing. Mr. Plumb suggested that the best way would be for him to take the company's check to his own order and pay the \$100 in currency. General Eckert, he adds, approved this plan, and Mr. Bates wrote an order to R. H. Rochester, the treasurer, and taking it from the room returned afterward with the money. Mr. Plumb adds in his affidavit:

At this interview the subject of a letter from Gen. Eckert or Mr. Bates to Fearing, guaranteeing the employment already promised by Mr. Wiman at a compensation equal to that he was receiving from John G. Moore & Co. aforesaid was discussed, Mr. Bates saying that he did not think it would be wise for either of them to write such a letter to Fearing; and General Eckert stated to deponent that the objection to the writing of such a letter was that said letter might get astray and be traced. At this interview General Eckert assured deponent that Fearing should be taken care of, as already promised by said Erastus Wiman; that it was all right, but that it would not do for them to write such a letter.

The letter says further that after Mr. Plumb had given the Mutual Union the information contained in his affidavit, he insisted that an interview should be held between himself and Mr. Wiman, at which any witness they might name should be present. The company deemed this but justice to Mr. Plumb and to Mr. Wiman, and they sent as a witness the stenographer mentioned above. At that interview Mr. Wiman asserted that Edwin Lord was about to bring a suit against the company for a bill of discovery. In concluding its history of the affair the letter says:

When a man sets about the commission of an act which, if exposed, will render him infamous, we must look somewhere for a motive commensurate with the risk. That the conspiracy, which was organized to bribe a confidential clerk to commit a larceny, was in the personal interest of Mr. Wiman, will not be believed by anybody; or that it was necessary to steal papers which the Court would compel us to produce, if Mr. Wiman had any lawful ground of complaint as a stockholder of this company. Mr. Wiman is a director of your company, and the President of your Canada enterprise, known as "The Great Northwestern Telegraph Company." Our company, when completed, will, through our allies, compete with you in Canada as well as here, and to defeat our enterprise and thus destroy competition, it would, in the estimate of Mr. Wiman, be advantageous to procure and publish "any information reflecting upon the management of the Mutual Union Telegraph Company, or of the private character or business of the officers thereof."

After offering to produce to the President of the Western Union Company any or all of the original letters and papers mentioned above, including General Eckert's receipt for the contract and Mr. Bates' memorandum of what was further required from Fearing, the letter says it is but simple justice to the latter and to Mr. Plumb to say that they acted in the matter only for the purpose of exposing the misconduct of the persons who sought to make them instruments in the commission of a crime.

In reply to all this Mr. Wiman said to a reporter: "It is a deep laid conspiracy for my betrayal. That it was concocted by the parties concerned is evident from even a hasty perusal of the nine columns of statement of the executive of the Mutual Union Telegraph Company in reiterating its charges against me. That it was a

plot into which even the most wary might have fallen there can be no doubt, from the preconcerted series of events as detailed in the statement."

He said further that the matter of getting a copy of the contract was brought to his attention by Mr. Plumb. He followed it up, he added, because he desired to expose the attempt to "demoralize the telegraph business in Canada," where he has large interests. He said that he may have remarked that the officers of the Western Union Company would be gratified to see the contents of the contract, but that he did not represent himself as acting in their behalf. Mr. Wiman said that when he promised Fearing employment he did not know that Fearing ever was with John G. Moore & Co. "The affidavit of Plumb," Mr. Wiman said, "is a tissue of falsehoods, and most of it can be proved utterly untrue by witnesses present at the interview he describes. That being so, all else falls to the ground."

Mr. Plumb, however, states that after the propositions of Mr. Wiman to obtain the papers and information respecting the Mutual Union by corrupting an employé of that company, took counsel with a number of prominent public men and was advised by them that it was a duty he owed the business community and the public generally to act so as to bring about a thorough and complete exposé of the nefarious transactions of Wiman and those he represented as acting with him. Mr. Plumb adds that should it be found necessary all the gentlemen with whom he consulted—and several of whose names he gives—will not hesitate to corroborate this statement.

In a newspaper card, the Mutual Union and John G. Moore & Co. say that Mr. Fearing, mentioned above, instantly revealed the alleged conspiracy to them, and add that his integrity is unquestioned and that he has their full confidence.

Another shot was fired into the Western Union camp last Monday by the brokers. At a meeting of the Petroleum Exchange on that day, a committee was appointed to lay before the Western Union Telegraph Company the defects of the telegraph service furnished to the Exchange, and to see if they can be remedied. The committee was also instructed to wait on the Mutual Union Telegraph Company and learn what service it is prepared to give.

The existence of the Union Telegraph and Construction Co.—which is the alleged construction company inside the alleged Mutual Union ring and about which Mr. Wiman was so anxious—is strenuously denied by the Mutual Union people and as vigorously reasserted by their opponents.

Meanwhile the Mutual Union is pushing ahead and expects to open for business to-day. The Western Union can no longer be called a monopoly. Many of its operators have left, and more are about to leave, to join the Mutual Union at increased salaries. These resignations are philosophically received by the officers of the Western Union, who make scant comment on them, having evidently some plan in reserve to meet the emergency. In some exceptional cases operators have been induced to withdraw their resignations, the consideration in each case being an increase of salary and a kind of permission to hope that salaries will be made more equitable in time to come. The seceding operators are mainly conspicuous examples of the effects of the pulverizing system which elevates one set of men at the expense of another, and which was introduced at the time of the consolidation. In nearly every instance the defection is from the ranks of the old Western Union force; those who were until lately American Union men having apparently nothing to gain by leaving the new Western Union Company.

The reported "fair action" of the Western Union in paying liberally for Sunday work turns out to be a first-class joke, since no man can be found who has received a single cent for Sunday work. This part of our "Review" is respectfully referred to the Brotherhood of Telegraphers. The rumor probably arose from the fact that in several large offices the men were paid extra for one Sunday—an extraordinary occasion—during the illness of the late President Garfield. We should like to hear from the rank and file on this subject.

The villainous system of chopping the opposition's poles is not allowed to languish, since, for a few dollars a day—or night—a telegraph company is able to hire a few unprincipled ruffians—mostly recent importations from abroad, for we should blush to call them Americans—who, with hatchet and saw, pursue the work of devastation and ruin. It will probably go on until the oppressed party carries the disgraceful system so its natural sequence—blowing up the main office of its rival. Both propositions are beneath the consideration of honorable men, but one is no worse than the other.

On Saturday last, Oct. 22, the grand jury of Essex County, N. J., found indictments against Hugh McAleer, superintendent of construction; Nicholas Y. Bradford, foreman of construction, and John Davis, lineman, of the Western Union Telegraph Company, for conspiracy. The indictments are founded on complaints made against the defendants some weeks ago by the officers of the Bankers and Merchants' Telegraph Company of this city, whose poles in the vicinity of Franklin they are charged with having cut down. A special constable of Essex County, who made the arrests, asserts that he caught at least one of the parties indicted in the act of cutting down the poles of the Bankers and Merchants' Company. Efforts will be made to have them indicted in other counties as soon as the grand juries meet.

We give this statement with caution, since one at least of the defendants—McAleer—is personally known to us as an honorable and conscientious man. We should be loth to believe that he is guilty of a sneaking crime, compared with which burglary and arson are respectable, and should accord to him the common right of being held innocent until he is proved guilty.

Electric light circles have been much agitated by reports of the great danger consequent upon the careless use of the light. The commotion first arose from the statement that the disastrous fire at Philadelphia, on the 12th ult., which caused the death of nine persons, originated from an electric light. An immense amount of newspaper argument followed, opinions being wide apart upon the subject. During the discussion, however, it was shown that fires have originated in this way, and that many men have been killed by electric light machinery. One of the workmen at the mill where the terrible sacrifice took place swore that only a few weeks previously the same electric light set fire to some cotton waste in the same mill, but that it was quickly extinguished and the matter hushed up. To crown all, the coroner's jury found, among other findings, that the building was set on fire by a defective electric light. Among other valuable opinions given, Mr. David Brooks, the electrician, said that "an electric light, with bare wires and unprotected burner, hung in a mill where there is any inflammable material whatever, is like throwing a match among a quantity of powder."

The past fortnight has been remarkable for tremendous storms on both sides of the Atlantic, in which the telegraph companies have suffered severely. At Cheyenne and thence westward the havoc was complete, and while repairmen were re-erecting the wires a sleet storm was tearing them down again. Telegraphic business, greatly delayed, was carried over the breaks by special engines. The hurricane in England, on the 14th and 15th ult., prostrated all the wires in the country; while from breaks and the influence of aurora borealis, the cables connecting that island with the continent were rendered useless. At one time communication with the outside world was completely cut off.

Advices from London report fair prospects for the telegraph in Mexico, Central and South America. One thousand miles of cable for the Central & South American Telegraph Company were completed in London, Oct. 13. Two cable steamers will sail on Nov. 15, and others will follow rapidly. Cable communication with Brazil will be established in May next, via Mexico, Central and South America. The traffic will be controlled exclusively by the four companies, namely: The Western Union Telegraph Company, Mexican Telegraph Company, Central & South American Telegraph Company, and West Coast of America Telegraph Company.

Telegraph stocks have, in the main, been steady during the past two weeks. On the 15th ult. Western Union stood at 86½, and to-day it is 87¼.

## A Short Explanation of the Blanchard Foods, With Suggestions Respecting Their Use.

The Blanchard series of concentrated and semi-digested liquid foods are extracts from wheat, beef and milk. They are adapted to build up the physical system, strengthening at once the mind and body, and repairing all conditions of debility of the nervous tissue and digestive organs.

The first in this series is the beef and milk, which contains in each quart the nutritive elements in thirty-two pounds of beef, and six quarts of milk: This combination having been subjected to the process of artificial digestion, has been found on trial to be the most admirably adapted of any known agents to meet the wants of a torpid, enfeebled or crippled digestive function that in one form or another accompanies scrofulous consumption, Bright's disease, diabetes, chlorosis, cholera infantum, all sorts of uterine disease, carcinoma, syphilis, and all the stages of convalescence in yellow and remittent fever, and also in all diseases of a malarial and miasmatic origin, together with nervous debility, which underlies all forms of chronic disease. For weakly, puny children this food is invaluable.

This digested food the weak and debilitated patient can use, and with it build up so that in a short time the fibrin and wheat can be taken, and later the tonic extract of wheat.

The FIBRIN and WHEAT contains in each quart the fibrin property in sixteen pounds of Beef, and the nerve-building elements in one-half bushel of wheat, which have been subjected to the process of artificial digestion. This is a preparatory food, and should be used previous to the tonic extract of wheat, for conditions of debility and irritation of the stomach and alimentary canal, exhibiting themselves by loss of appetite, failure to retain food, flatulence or oppression in the stomach after eating, dryness of the mouth, etc., and also for all chronic constipated conditions. Usually one-eight ounce bottle of this will strengthen the nervous system and muscular tissue of the stomach sufficiently so that the tonic extract of wheat can be used with greater efficacy.

The BLOOD AND NERVE FOOD, or TONIC EXTRACT OF WHEAT, is manufactured from the exterior of the wheat kernel, by a process peculiar to ourselves, by which the vital nutritive elements, the iron, phosphorous, lime, etc., which are in the highest degree food to the plastic element of the blood and nervous system, are extracted without chemical change, so that the condition called vitalization, given them by vegetable growth, is retained, the product becoming a nutritious, concentrated liquid, every quart of which contains the vital nutritive elements in a bushel of wheat.

This food is designed to meet the wants of the nervous tissue, to repair the waste resulting from vital activity in all cases when there is no serious impairment of the function of digestion.

For those engaged in literary or professional labor, exposed to severe mental strain, this force is invaluable.

The CARBONACEOUS FOOD is designed for external application, and for use in cases of consumption and chronic diseases of a severe type, to assist the function of digestion, by applying elements that are taken up by absorption.

By its use the system may be in a large degree supplied with fat-forming food or fuel for the maintenance of animal heat without taxing the digestive organs. The external application of this food is far more efficacious than the internal administration of cod liver oil, the effects of these two being identical.

The life food consists of a combination of the fibrinous property of beef, and the nerve-building elements of wheat, so thoroughly digested that it will enter the blood within five minutes after being taken into the stomach. A dessert spoonful of this perfect food, taken with a glass of milk, is a beverage of agreeable flavor, which imparts immediate invigoration; it is recommended to all as a strengthening drink. It has no alcoholic property. This food is especially adapted to be taken between meals, in water or milk, to relieve a sense of "goneness," weakness, or craving, which characterizes extreme nervous debility, especially in patients suffering from tobacco, alcohol or opium habit.

Let it be borne in mind that in all of these foods a large proportion of nitrogenous element has been eliminated; as well as all other elements that do not possess vitalizing invigorating quality.

These foods are curative, but no medicine or drugs enter into their composition. The business man, weighed down with commercial affairs, the student, lawyer, minister or doctor, contracting a debilitated condition by over brain-work; woman overburdened with cares of maternity; the child suffering with the ills of childhood; in fact, all conditions are built up by these simple, easily-digested and concentrated foods.

THESE FOODS are to be taken directly after meals in quantities from five drops to a teaspoonful, varying according to age of the person and condition of the digestive organs.

With the foregoing explanation, any one can decide which preparation it is desirable to use first.

#### APPLICATION OF THE BLANCHARD PREPARED FOODS.

In the application of the Blanchard Prepared Foods in the first or premonitory stages of consumption, Bright's disease, diabetes, chlorosis uterine disease, dyspepsia, carcinoma, syphilis, and all diseases of a hereditary or specific origin, as well as after the disease has become developed, the patient should first commence with the beef and milk, taken after each meal, according to directions, the life food being also taken between meals, and the carbonaceous food being applied on going to bed. After the system of the patient has become considerably toned up and invigorated by this method, the fibrin and wheat should be substituted for the beef and milk, the patient meanwhile continuing the use of the life food and carbonaceous food. After the patient's digestion is fully restored and the natural strength nearly regained, the tonic extract of wheat, should be substituted for the fibrin and wheat, and at this point the carbonaceous food may be omitted, although the use of the life food should be kept up. In order to insure permanent results the use of the tonic extract of wheat and life food should be continued some length of time after the patient has regained a normal degree of endurance, weight and vigor. While taking the Blanchard Prepared Foods the patient should avoid as far as possible the use of starchy foods, such as potatoes, rice and farina, and also rich pastries and condiments. Alcoholic beverages, cordials and tobacco should be avoided. Graham bread, gluten, wheaten grits, and oat meal may be eaten. Milk should be taken with each meal in quantities the stomach will bear, to which should be added on each occasion for the first month two tablespoonfuls of lime water. Milk, from which the cream has been taken, is sometimes better adapted for the dyspeptic stomach than in a natural state. Fish, eggs and lean meat (beef preferred) may be eaten freely, also an abundance of ripe, sound fruit. A sponge bath daily, with vigorous friction applied to the skin, is a valuable auxiliary. If the habit of costiveness is present, the patient should use an enema of warm water daily until the natural function is restored. The patient should avoid all laxative and cathartic agents; retire early to bed, and avoid over exertion, mental and physical, until the health is fully restored.

#### DEPOTS.

New York City, 27 Union Square, 163 Broadway.

Harlem, Benson's, 2,334 Third avenue.

Brooklyn, Lizzie S. Hubbard, 284 Fulton street.

Portland, Me., J. W. Perkins & Co., C. H. Wharf.

Hartford, Conn., L. H. Goodwin, corner Main and State streets.

Philadelphia, Pa., Johnston, Holloway & Co., 602 Arch street.

St. Paul, Minn., Noyes Bros. & Cutler.

St. Louis, Mo., A. A. Mellier.

San Francisco, Cal., E. M. Domett, 714 Shotwell street.

Boston, Mass., J. Jay Watson Co.'s Agent, 28 Schoolstreet.

Boston, Mass., Smith, Doolittle & Smith, 24 Tremont street.

Syracuse, Kenyon, Potter & Co.

Cleveland, Ohio, S. P. Churchill, 32 Euclid avenue.

Washington, D. C., W. S. Thompson, 703 Fifteenth street.

Cincinnati, Ohio, Rauchfuss, Naglo & Co., 224 Main street.

Chicago, Ill., Morrison, Plummer & Co.

Chicago, Ill., Gale & Blocki.

General agent for the Southwest, Joseph B. Gribble, 96 Canal street, New Orleans, La.

BLANCHARD MANUFACTURING COMPANY, PROP.,  
27 Union Square, New York City.

#### The Electrical Exhibition at Paris.

[From the Special Correspondent of The Operator.]

As the season wears on and the cool weather approaches, the great interest manifested in the exhibition up to within a couple of weeks seems to be cooling off also, and the crowd becomes thinner and thinner each day. The congress has adjourned and the juries have completed their work and announced the results of their investigations. Now that the serious part of the show is finished the fête season is commencing, and we hear of a number of jollifications that are to take place or have already passed. The Maxim and Weston electric lighting companies gave a dinner on Wednesday, Oct. 12, at the Café Riche to the American exhibitors, several French electricians and members of the foreign press resident here. There were in the neighborhood of 200 persons present, and a most enjoyable evening was spent. The French members of the press gave a dinner to the foreign members in the Hotel Continental on the following day, and on Saturday evening there was a special occasion at the Grand Opera for members of the congress, followed on Tuesday, the 18th, by a promenade to examine the various systems of electric lights that are being placed in the Opera-house. I was slightly in error in my last letter in saying the contract for lighting the Opera-house had been given to the Edison Company. The government authorities having the matter in charge invite the several incandescent and the most prominent arc light companies to place a few of their lights in the Opera-house for a few days for a competitive trial, at which it would be decided which company should have the permanent lighting of the house. The Edison, Maxim and Swan incandescent, and the Brush, Jablochhoff and Werderman arc light companies are among those who have accepted the invitation, and will have specimens of their lights on exhibition. The Edison Company have been assigned to the lighting of the foyer, while the Swan people have the grand chandelier, each system having about 600 lamps.

Among the things to be seen in the American section is a novel method for winding magnets. The convolutions of wire wound one over the other, as at present, are dispensed with and replaced by a copper band about three-eighths of an inch wide and very thin. This band is wound spirally around the cores in such a manner that its inside edges are placed on each core. The parts of the spiral are insulated from each other by being covered with a coating of shellac, which makes such a thin insulation as to allow of from one to five hundred convolutions of the spiral to an inch. The advantages claimed for this system are that much more magnetism can be developed than by the old system, with less resistance; also that there being but one layer of convolutions, with the outer edge of the spiral exposed to the air, there is no heat accumulated near the magnet, because any heating caused by the passage of the current is conducted to and carried off by the air. Experiments made with a magnet wound with one of these spirals showed one-third more power than one wound in the old way having the same total section, weight and resistance. The exhibitor is Mr. Dion.

Professor Bell's photophone and radiophone have just arrived, and the apparatus has been placed in our section. The instruments are not connected up and no experiments are being made, consequently they attract but little attention. Professor Bell himself has sailed from America and is daily expected here.

Mr. A. Pzatz, of Philadelphia, shows a new form of one liquid battery, the mechanical novelty of which consists in a hollow cylinder of carbon dotted with pores, forming a circular row of bars

for the double purpose of increasing its surface and causing a free communication of the liquid, the zinc being suspended in the cylinder. The liquid consists of a compound solution of chloride of zinc and bichromate of ammonia. The initial electro-motive force is 1.65 volts and the resistance 1.6 ohms. This battery is intended for the same purposes as the Leclanché.

#### Medals for American Exhibitors at Paris.

A dispatch from Paris, on the 14th ult., says that the jury of the International Electric Exhibition has awarded gold medals of the highest class to Edison and Brush for dynamo-magnetic machines, and a gold medal to Maxim. Also, gold medals to Edison, Brush and Maxim for arc incandescent lights. Edison takes five gold medals in all, being more than any other exhibitor. He was also awarded the highest prize diploma of honor. Five different juries examined his exhibits.

As a mark of the greatest distinction, diplomas of honor have been awarded to the United States Signal Office, the Smithsonian Institution, the United States Patent Office, and to Messrs. T. A. Edison and A. Graham Bell.

Gold medals were awarded to the Anglo-American, Brush, and United States electric light companies, and to Professors Elisha Gray and Sumner Tainter.

Silver medals to J. F. Bailey; W. G. A. Bonwill, of Philadelphia; Connolly Brothers and McTighe, of Washington; A. Emerson Dolbear, of Somerville, Mass.; Electric Purifier Co., of New Haven, Conn.; Chas. W. Hubbard, of Boston; W. J. Phillips, of Philadelphia; Pond Indicator Co., of New York; Western Electric Mfg. Co., of New York and Chicago; Weston Electric Light Co., of Newark, N. J.; Electro-Dynamic Co., of Philadelphia; also to Messrs. Eccard and Puskas or Puskas, neither of whom we can find on the list of exhibitors.

Bronze medals were awarded to Messrs. V. Chavet; George Cummings, of New York; Hoo-sac Tunnel Tri Nitro-Glycerine Works; August Partz, of Philadelphia; Photo-Relievo Co.; White House Mills; Charles Williams, Jr., of Boston; and a Mr. Dion, whose name we are also unable to discover among the official list of American exhibitors.

Diplomas of honor were given to various railway companies, including English, Australian, Spanish, Italian and American; to the Breguet-Christophle Telephone Company, and to the inventors Baudot, Edison and Siemens.

#### A New Electric Bell.

In our present issue the Long Distance Electric Call Company advertise their new patent call bell. This bell will doubtless attract considerable notice as a novel invention, claiming results which have not previously been attained by an electric bell. It is a simple and most ingenious call, and will probably be advantageously adapted to other purposes than telephone uses. But as a call for telephone exchanges it lays claim to strong points in its favor, and noticeably, among others, the instantaneous warning which is automatically given when a break occurs in the line. With a monitor of that kind at his elbow, the subscriber will naturally feel that he cannot be cut off unexpectedly from the central office without receiving timely notice.

The secret of the invention seems to be the appreciative control of the electric current and the successful utilization of a very slight electric force to operate a most ingeniously devised mechanism whereby the results claimed are obtained.

#### Weather Wisdom.

When you wish to know what the weather is to be, go out and select the smallest cloud you see. Keep your eye upon it, and if it decreases and disappears, it shows a state of the air which is sure to be followed by fine weather; but if it increases in size, take your great coat with you if you are going from home, for falling weather is not far off. The reason is this: When the air is becoming charged with electricity, you will see every cloud attracting all lesser ones toward it, until it gathers into a shower; and, on the contrary, when the fluid is passing off, or diffusing itself, then a large cloud will be seen breaking into pieces and dissolving.

## TELEPHONE DEPARTMENT.

The various fire-brigade stations of Sydney, Australia, and suburbs are to be connected by telephonic communication.

The Swiss government is establishing telephonic communication in Berne. The wires are carried over head on posts fixed to the house-tops.

In a full-page advertisement in this issue, Messrs. Post & Co. give an explanation of the operation of their latest improved and justly celebrated switch-board, which telephone men will find interesting. The most complete and perfect telephone exchanges in this country—including Providence and others—use the Post switches.

A dispatch from St. Petersburg, dated Oct. 25, says that the Russian government has determined to keep governmental control of the whole telephone system now being erected, and by a relay or exchange system involving a repetition its police or other officers in charge will have a knowledge of every communication over the line.

The Herz system of telephony has excited special attention among electricians in Europe, on account of the surprising distances through which telephonic communication has been maintained by it, and especially since the announcement that a conversation had been carried on through the cable connecting Brest and Penzance—a thing generally considered impossible, on account of the comparatively sluggish action of the electric current in submerged cables. The Herz system—by which conversation, it is stated, has been carried on through an actual distance of over 600 miles over circuits having no special adaptation to telephonic communication—claims to have solved two difficult problems, viz., that of increasing the amplitude of electrical vibrations, and of neutralizing currents foreign to the telephonic circuit.

In the suit for infringement of patent by John H. Irwin and the Western Electric Manufacturing Company against the Metropolitan Telephone and Telegraph Company and another, Judge Blatchford in the United States Circuit Court, on the 21st ult., in this city, handed down the following decision: "I think the proper and necessary construction of claims one and two is that the normal pressure of the electrode must be obtained by means of gravity counteracted partly by a delicate retractile spring, elastic in the direction opposed to gravity. The spring must suspend the needle against the force of gravity. The defendant's instrument does not employ gravity to secure pressure, nor a spring to modify the force of gravity, but it obtains the normal pressure of the electrodes by the direct strain of a flat spring. There is no infringement of claim 3. The vibrating disk of the defendants does not have free edges, and is not capable of vibrating bodily in the sense of the patent. In consequence of being held by the spring and the clamp, it bends, and some parts between the centre and the edge move more than others. The bill will be dismissed with costs when the case is disposed of as to the American Bell Company."

One of the attendants at the Ithaca telephone exchange was awakened recently by the gong, and he got up to answer the call. He "helledo" until tired, but heard no response, and then turned in again. About fifteen minutes later the gong again struck, and this time he found two buttons down. He answered each caller and asked what was wanted, but again failed to get any reply. Muttering, he went back to his couch only to be aroused again by the gong. Once more he responded to the alarm, and this time there were five buttons down. The attendant, after going through this sort of business once or twice more, aroused his companion, and they resolved to investigate the cause of the mysterious calls. They assumed a position where they could see what was taking place in the room and quietly awaited another call. They had not been long on picket duty before the innocent disturber of their dreams appeared in the shape of a mouse, which little animal, by running across the key-board, caused the buttons to drop and the loud gong to sound its warning. The operators straightway set a trap for the mouse and soon had the satisfaction of catching him, after which they tried some practical experiments in electricity upon him, resulting in his cremation and undisturbed rest during the remainder of the night.

## DASHES HERE AND THERE.

The letters in the word "telegraph," when transposed, make the words "great help."

Boys, read the offer made by the Acme Mfg. Co. Printing Press and complete outfit only \$2.

What lineman can point us out a pole to beat the champion? It carries 350 wires, and stands in Chicago.

The network of German subterranean cable is completed. It connects 221 towns, and has cost about \$7,000,000.

It is said that the attendance at the Paris Electrical Exhibition is falling off rapidly, and that it will soon be closed.

From Tunis comes the news that the Arabs broke the submarine cable between Bizerta and La Calle on the day on which it was opened.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—*Advt.*

The American Electric Railway and Power Company filed articles of association at Albany, on the 24th ult. Capital, \$10,000,000. The principal office will be in New York.

A Hull (England) newspaper reports that after a month's trial of the Brush electric lights at Scarborough Spa the Directors resolved to go back to gas, and ordered the removal of the electric-lighting apparatus.

A telegraph "college" at Oberlin, O., offers the first month's board free of charge to new students. Although the telegraph business is booming, some of these "professors" do not appear to be overrun with business.

An attractive advertisement of the pianos and organs manufactured by the well-known Mayor Daniel F. Beatty will be found in another column, to which we would draw the attention of the readers of THE OPERATOR.

Farnham's Armaline is a specific and reliable cure for operators' and writers' cramp or pen paralysis. Authentic testimonials from all parts of the country. Send for circulars and treatise to Brown, Pettibone & Kelly, stationers, 194 and 196 Dearborn st., Chicago, Ill.—*Advt.*

The East is just now laughing at the great West for bulling the famous Garfield saying into "God resigns and the government at Washington still lives." The West retorts with the old bull on Sir E. Head, Governor-General of Canada, who received a telegram from an Eastern artist addressed to "Sore Head."

Consumption being more prevalent among telegraphers than any other malady, a long-tested and proved remedy for that disease is a matter of deep importance to the fraternity. For this reason it will hardly be necessary for us to draw attention to the letters of testimony in the full-page advertisement of J. H. Schenck & Son

Little 'Rastus Wiman trying lies to tell, Blund'ring and failing, then swearing like — Well,

Never mind old Peck, wipe your eyes off wid yer frock;

There's lot of money yet to make in Jay Gould's watered stock.

A system of railway carriages, worked by electricity, and constructed for the transport of postal matters through large cities, will be established at Paris, in the Palais de l'Industrie, under the gallery facing the Seine; the line will be 180 metres long. An electric elevator has been constructed, and will be placed at the disposal of the public as soon as sufficiently tried.

The Philadelphia Record, of Oct. 22, says: "A souvenir of the Electrical Exposition in Paris has been brought to this country by the Hon. Strickland Kneass, of the Pennsylvania Railroad. It is a life-like drawing of the shoulders, head, face and mouth of an officer of the French Grenadier Guards, which was transmitted a considerable distance by electricity. The drawing is about 6 inches long by 3 wide, on ordinary white paper."

At the close of the year 1880 there were in the United States 170,103 miles of telegraph lines, and during that year 33,155,991 messages were sent. The miles of wire were about 300,000, but the mileage has wonderfully increased since last New Years. This does not include the lines used exclusively for railroad business. The other countries having the greatest length of lines are

as follows: Russia, 56,170 miles; Germany, 41,431; France, 36,970; Austria-Hungary, 30,403; Australia, 26,842; Great Britain, 23,156; British India, 18,209; Turkey, 17,085, and Italy 15,864.

A full-page advertisement of the Gamewell Fire-Alarm Telegraph Co. will be found in another part of this issue. This company feels so confident of its position that it "challenges any one to show that there is in use at the present time, anywhere, a single valuable feature or improvement in fire-alarm telegraphy which it does not control." Mr. J. N. Gamewell, who has been so long connected with the company, is still the general superintendent.

News did not travel as rapidly a hundred years ago as it does in our day and generation. It was not until the 24th of October, 1781, that Colonel Tilghman brought to Philadelphia news of the surrender of Cornwallis, which virtually took place on the 17th of the same month. But still more strange, the important information of the arrival of Admiral de Grasse with his fleet in the Chesapeake on the 26th of August did not reach General Washington (then near Philadelphia) until Sept. 4 following—as Secretary Trumbull remarks—"News strangely delayed, but very welcome."

Although Messrs. L. G. Tillotson & Co.'s is the largest and oldest telegraph supply house in America, their attractive four-page advertisement in the present issue shows that they have not lost any of the judicious and intelligent enterprise which has always characterized their manner of bringing their goods before the telegraphic public. His wants must indeed be well supplied who cannot find something that he needs among their four pages of advertisements.

The Chicago Tribune is explaining to its readers how Mr. Jay Gould circumvented the Chicago aldermen in introducing the American Union lines into their city. According to the story, the statesmen wanted \$40,000 for the privilege, while Mr. Gould was only willing to buy them at a lump sum of \$20,000, and while the go-betweens were haggling over the bargain Mr. Gould secured the Baltimore & Ohio franchise, thus reaching the heart of the city without dividing a dollar among the city fathers.

"A first-class telegraph clerk in England, under the present system, may, with good luck and good conduct combined, after eighteen years' service, raise himself to a pecuniary pinnacle whereby he would be entitled to a salary of \$500 per year." Young man, if you don't like this country; if it isn't broad enough for you; if it is too new and raw and rude, if its lack of culture and old world refinement starves your intellectual being, as it were; emigrate. Go to England and grow up with the telegraph service. There's a chance for you.—*Hawkeye.*

There is a talk of organizing a pony express, as of old, to get the news each night in time to be published in the morning papers. Owing to the lack of facilities and the poverty of the Telegraph Company in not being able to pay salaries large enough to induce good men to work, the papers belonging to the Kansas & Missouri Associated Press are not in receipt of all the dispatches paid for in time to get them up and get out papers as soon as subscribers want them. Then the dispatches we do get are so mangled as to be almost unintelligible.—*Topeka (Ks.) Commonwealth.*

It is said that the whole of the Paris electric exhibition is to be transferred to London. This action is taken with a view to holding at the Crystal Palace, in December next, an international exhibition of electricity, at which all the existing systems of lighting will be presented. At the same time it is proposed to form a collection of electrical apparatus generally, including the various forms of telephones, secondary batteries and a large variety of scientific objects concerned in the production or employment of electricity and magnetism. An influential meeting at the Mansion House, on Monday last, at which the Lord Mayor presided, approved of a plan for holding an electrical exhibition at the Crystal Palace.

The Dutch claim to have been the precursors of Franklin and of Faraday. Curious old manuscripts have been exhumed in Dutch and Belgian libraries, and are now on exhibition at the Paris Exhibition to show that savans had groped

their way a long distance on the road which the Boston philosopher trod with a sure foot toward the end of the last century. Italy shows many documents to throw light on the part which scientific method and the divining powers of genius played in the discoveries of Volta.

The Buffalo (N. Y.) *Sunday Times* tells a story of an operator of that city who was thinking of emigrating to Russia, and wrote to a friend at Helovisky about wages there. He learned that "operators there received eight cents per day and found himself." "Yes, finds himself pretty hungry at times, I'm thinking," said the Buffalo man, pensively.

Important interview between General Eckert and Mr. Erastus Wiman after the publication of the Mutual Union charges:

Mr. WIMAN.—Well, General, I'm sorry, but you see we had to —

Gen. ECKERT.— — — — — !

Mr. WIMAN.—But, General, we —

Gen. ECKERT.— — — — — !! — — — ? — — —

Mr. WIMAN.—Yes, but the money —

Gen. ECKERT.— !!! — — — — — ? \$250 —

— — — \* \* \* blazes !!! Three fifty-dollar bills !!!

— — — you — — —.

Mr. WIMAN.—You're another, sir !

*Loud sounds*—Whack, thump, bump, bang, whang—(voices of numerous clerks) "That's right, General. Out the fourth story window with him"—whang, bang, thump—"Ha ! out he goes"—bump !!!

*Deep silence, slow music and blue fire.*

## NEW YORK CITY ITEMS.

### Echoes From 195.

During a rush of business to Boston last week, John K. Calvert sent 250 messages in 180 minutes on the motor.

The telegraph machinery at Yorktown, during the recent celebration, was looked after by John W. McLaren, of "195."

One of the most wide-awake, impartial and thoroughly competent men on the floor is Chief Operator Thomas Brennan.

On Oct. 25 Joe Wood, of Boston, sent Operator William Cooke, of "195," two hundred messages in just three hours, on the Boston Morse quadruplex.

When a 195-ite says—Wordsworth slightly altered—"their beauty makes me glad," he refers to the young ladies of the Eastern division.

The boys are taking a last fond look at Mr. Downer's farewell address. Somebody facetiously remarks that mourning should be removed after 30 days.

If General Manager Eckert would cause a few thousand dollars to be expended in ventilating the operating room, he would be erecting a monument more lasting than brass.

On the 15th ultimo the gallant Colonel Lenhart was seeking for the reporter of THE OPERATOR, thirsting for his gore. It was a very wet day for the poor scribe, and perhaps he might have been happier if he had been an umbrella.

### Other City Items.

Mr. W. J. Dealy returned from England on the 25th ult., looking first-rate after his sojourn abroad.

Mr. Edison has just completed a miniature electric lamp, the flame from which, though 500-candle power, will not exceed the dimensions of a silver five-cent piece.

Mr. A. B. Chandler, for the past two years President of the Atlantic & Pacific Telegraph Company, has accepted the Presidency of the Fuller Electrical Company.

Everything at "135" is moving along nicely. There have been some changes in the force, the latest of which is the arrival of Charley Noble from Montreal; also William A. Dempsey and James O'Leary, same place; Mr. Darrah, Providence, R. I.; Mr. Dresser, Rochester, N. Y. and Mr. Stevers, Oswego, N. Y.

There was a report current in some circles on Wednesday last that the Western Union had acquired control of the Postal Telegraph Company. The report is denied by authority of the officers of the latter company. It doesn't seem as if there is very much yet about the Postal Company to control.

A grand annual invitation ball will be given at Irving Hall on Wednesday evening, Nov. 9, by the Telegraphers' Benevolent Association, an organization numbering among its members all the principal linemen, repairers, etc., in this city and vicinity, and of which Mr. Robert Carter is President and Thomas H. Morse, Secretary.

The many friends of Mr. George Cumming will be glad to know that his periphery-contact Morse telegraph key has been awarded the prize of a bronze medal by the jury of the Electrical Exhibition at Paris. The key has been so well received by American operators, that it is gratifying to find the noted electricians composing the jury of the Electrical Exhibition also recognizing its merits in so substantial a manner.

The stockholders of the American District Telegraph Company held their annual meeting on the 18th ult. The directors elected are as follows: T. C. Platt, A. B. Cornell, A. B. Johnson, Chauncey M. Depew, D. N. Crouse, E. W. Andrews, F. B. Wallace, William A. Williams, Theodore A. Roundy. The treasurer's report showed the total receipts to be \$467,948.08; the aggregate expenses and repairs, \$380,207.56; net receipts over expenses, \$82,740.52; surplus, \$117,127.14.

Mr. H. F. Ogden, whose resignation as Manager Met. T. & T. Co.'s 21st office was chronicled in this column last issue, can be found by his friends in the office of the electrical manufactory of Mr. J. H. Longstreet, No. 9 Barclay street. We are glad to add that Mr. Longstreet is just now doing a very large business in telegraph, telephone and electrical instruments and supplies, and his factory is running to its fullest capacity.

The Met. T. & T. Co. have sold their territory and plant outside of Manhattan Island. The portion sold embraces Long Island, New Jersey, and the territory north of Harlem River, including Yonkers, etc. The headquarters of the new company are at present with the Metropolitan Co., corner Liberty and Greenwich streets, New York, but will be removed to Brooklyn about Nov. 1. Mr. L. B. Harris, of Manchester, N. H., has been appointed General Manager. Mr. Harris is also one of the principal stockholders. Mr. F. C. Mason, recently a private line contractor in Brooklyn, has been appointed Manager of Construction, and Mr. J. Powers, of Pittsburgh, Pa., Manager of the central office of Brooklyn and Williamsburgh.

## PERSONAL.

Mr. W. D. Scott, late of North Sydney, C. B., is now working at Canso.

Mr. Elmer A. Cook, of Huntsville, O., was in town last week, and paid THE OPERATOR office a visit.

Mr. J. S. McClelland has resigned his position in the Montreal Telegraph office, Toronto, Ont., and accepted one in this city.

Mr. P. V. Mehen, Manager G. R. & I. city office, Grand Rapids, Mich., and family are spending a few weeks with friends and relatives in Wheeling, W. Va.

Mr. George Roland, formerly press operator in the Houston (Tex.) W. U. office, has resigned, to accept the position of train dispatcher for the I. & G. N. Ry. at Palestine, Texas.

The officers of the Mutual Union Telegraph Company are John O. Evans, President; Geo. H. Holt, Treasurer; Chas. F. Peck, Secretary; Walter Katte, Engineer-in-Chief.

Messrs. E. J. Holden, J. M. Sullivan, J. H. Hutchinson and J. H. Burke have resigned their positions in the Boston, Mass., W. U. office and gone over to the Mutual Union, same city.

Mr. M. G. Bagley has resigned his position as W. U. manager at Rutland, Vt., and gone into partnership in the manufacture of marble mantels and other house-furnishing goods. The firm is Brown and Bagley.

P. W. & B.—At "Ba." we have Mr. C. M. Thompson, an old timer, and Mr. W. B. Curry, days, and Mr. Davis nights. At Canton, F. H. French day man and Johnny Roberts at night. At Bay View Junction (Tower), Phil Brown day and Jack Glenn at night.

Mr. F. C. Lacey has resigned his position with

the W. U. at Topeka, Kan., Oct. 1, to accept one as train dispatcher for the C. H. & H. R. R., at Houston, Tex. Mr. Lacey has the best wishes of a host of friends for his success in his new and more responsible field of labor.

Mr. William Davidson, of the Milwaukee Western Union office, has resigned, and gone to Chicago. Mr. MacDonald, of the same office, is substituting at Madison, Wis., and A. C. Shape has resigned, to accept the managership of the Marquette, Mich., office.

Mr. Charles Howard, the publisher of the *Scientific American*, dropped dead in a drug store at the corner of Broadway and Forty-first street on the night of the 13th ult. The cause of his death is supposed to have been heart disease. Mr. Howard was 31 years of age.

Mr. S. J. Dennis, brother of Mr. J. R. Dennis of the San Francisco W. U. office, was shot near that city, Oct. 16, by the accidental discharge of a Winchester rifle. His face was badly burned, but it is thought that he will recover. He was brought to San Francisco for treatment.

A short and sharp correspondence recently took place in the Milwaukee papers between Chief Operator Shape and an alleged outsider, in regard to the ability of the W. U. operators throughout the Northwest. The outsider seemed to get the best of it, and appeared to have the sympathy of the operators.

Mr. Harry A. Gray, of Arapahoe, Neb., has gone to Florida for his health. On his return he will take a position that has been offered him in the dispatcher's office of the B. & M. R. R., Lincoln, Neb. Mr. Gray is agent for THE OPERATOR, and will, we hope, secure us some new subscriptions during his travels.

Messrs. A. G. and E. B. Saylor, well known and efficient operators, have resigned their positions in the Portland W. U. office, to accept situations with the same company in Philadelphia. The vacancies will be filled by Mr. Charles H. O'Brien, night owl, Augusta, and Mr. Charles Stevens, operator Eastern Railroad, Portland.

Nearly all the telegraphers on the Illinois Central Railroad are both agent and operator. Salaries range from \$30 to \$75 per month. Some of them work from 7 A. M. till 10 P. M., and two hours every Sunday for \$35 or \$40 a month. Independence office pays \$30 per month, and the operator (a lady) furnishes office fuel, lights and message boy. Yet it is a city of 5,000 inhabitants.

Mr. Richard Smith, of the Cincinnati *Gazette*, who now leases a wire of his own from Washington to Cincinnati, was at one time a telegrapher in the latter city, and assisted at what was then thought to be a great telegraphic feat, viz.: Telegraphing the annual message of President Polk, an achievement in wholesale telegraphing which had never before been attempted.

The present force at the Salamanca W. U. office consists of T. W. Potter, Manager; W. F. Melhurs, Chief; J. S. Taggart, Night Chief; G. R. Rigdon, D. Collins, J. Flanagan, G. Leveridge, J. Shields, G. R. Spencer and T. E. Williams. They all say they have as much as they can attend to. Manager Potter, while on his wedding trip recently, lost all his baggage by the sinking of the steamer on which he took passage.

Wm. J. Sipple, a former Erie Railway operator, has been arrested in Jersey City for attempting to rob the Erie Railway Company of \$60,000, by telegraphing, in the name of Treasurer Spencer, to the paymaster to hand the money to a man who should call for it. It was a carefully planned and daringly executed attempt at robbery, but failed through a telegram being delivered to Mr. Spencer and a speedy investigation by that gentleman.

Mr. A. C. Man, manager of the Burlington, Iowa, office, having resigned that position to accept a more lucrative one in Chicago, was relieved Oct. 15 by Mr. J. F. Ludwig, formerly manager of the same office. There are no other changes in the office, with the exception of the addition of Mr. A. L. Nash to the force, and filling the vacancy of night press man, caused by Mr. Keene's promotion to the day force.

ATCHISON, KAN.—Mr. J. Levin is still the efficient manager here. Mr. H. M. Scholls, night report man, has resigned his position to accept a better paying one in Kansas City. His successor

is Mr. Cox, from Texas. Mr. Raymond, besides being a first-class operator, is very well known in musical circles. Mr. Johnston, of Kentucky, works the Kansas City wire. Mr. Reid, who was manager of the G. W. Tel., at Bloomington, Ill., in days of yore, is working here.

At the examination, in Washington, of Captain H. W. Howgate, on the 18th ult., upon the charge of embezzling government funds while in charge of the Signal Service, several officers of the Western Union Telegraph Company were examined, among them D. H. Bates, the general manager, J. B. Van Every, auditor, and R. H. Rochester, treasurer, all of New York. On the 21st ult., the Grand Jury found an indictment against him, charging him with embezzling over \$90,000 from the government.

Mr. Paul W. Bossart, Supt. of the Telephone and Telegraph Co. at Kansas City, and wife, were guests of Mr. Jim Nelson, of St. Louis, during the fair week. Mr. Nelson thinks he has a good joke on Paul. After viewing the Veiled Prophets' procession up town, they came down to Fourth street. Mr. B., becoming weary, sent Paul for a carriage. In half an hour he returned with an immense paper bag, and reported he was unable to get a carriage, but that *he had found some peanuts.*

Mr. C. Dougherty, a veteran telegrapher, who for many years has had charge of the "C. & D." for the Western Union at St. Louis, has been appointed manager of the Mutual Union in that city. The company has secured a very desirable location at No. 207 North Third street, and expects to be ready for business early in November. Mr. W. E. Mulford, late of the W. U. office, St. Louis, and formerly of the American Union, has been appointed manager of the B. & O. office in St. Louis, which is expected to open shortly.

H. A. Lyon is day dispatcher, Mr. J. E. Seyster, formerly agent and operator at Kempton, night dispatcher, and C. J. Croninger, agent Illinois Central Railroad at Pontiac, Ill. A. F. Osborn is agent and operator at Chatsworth; John Brice, at Colfax; W. S. Kettinger, at Kempton; B. Hutchinson, at Cabery; S. R. Crawford, at Buckingham; F. B. Whittum, at Hersher; J. D. Leterneau, at Griswold, and John Kane, at Eylar. Mr. A. J. Esken, manager of the repeating office at Otto, is among the best operators on the line. Business is booming.

HOUSTON, TEX.—Mr. Phil Fall, for many years operator and at one time manager of the W. U. office here, has resigned, to accept a position with the G., H. & H. Ry., city office. Mr. George H. Leach has been appointed day chief, *vice* J. A. McNabb, resigned. Mr. Mike Connolly, our ex-lawyer, and once mayor of a town, is working here now. Mr. George B. Ashley, one of our late arrivals from New Mexico, works the New Orleans quad. Mr. Shaw, formerly press man at St. Louis, is now taking report here. Mr. William Petty, formerly of the G., H. & H. freight depot, is now operator in the general office of the San Antonio Railway.

ILLINOIS CENTRAL R. R.—C. P. Illingsworth has resigned a \$30 position at Epworth, Iowa, for one of night train dispatcher at Oxford Junction, on C. M. & St. P., at \$60. W. T. Kendall has left Winthrop, and H. Martin Masonville, to accept better positions on the D. M. & Ft. D. and C. & N. W. Rys. Their successors are C. H. Dodd and his brother, A. L. Dodd. J. B. Fuller is located at Epworth, and W. G. Bolger at Peosta. M. J. Goodrich goes to New Hartford and M. G. Egloff to Cedar Falls. Mr. Nels Munger still gets trains safely over the road in good shape, and Johnny Norman performs the same duty at night. Mr. Kelsey is at Manchester, Mr. Chesley at Delaware, Mr. Jones at Earlville, Mr. Morley at Dyersville, Mr. Barker at Farley, Mr. Tabor at Raymond, Mr. Smith at Jesup and Mr. Durham at Independence; all good men.

N. Y. D. A. V. & P. R. R., Daisy Moon, chief train runner, Dunkirk, N. Y., is assisted by James Shaughnessey. At Fredonia, W. T. Chapman is in the R. R. office, and W. P. Jobs in the W. U. At Laona we find J. M. Woodcock; at Cassadaga, L. D. Jones; at Sinclairville, E. F. Patterson; at Vermont, S. W. Padlock; at Falconers, James Hughes; at Junction, C. A. Sloon; at Fremsburg, Mike Glaspy; at Fentonville, S. J. Sparks. Then we come into

Pennsylvania. At Russelsburg is C. E. Cobb; at North Warren, Mr. Hapgood; at Warren, C. Mead and Will. Youngs; at Iron-ton, an old timer, Geo. Stillman, an old army operator; at Youngsville, L. McDowell; at Garland, Geo. Woodcock, "M. D."; at Grand Valley, Mr. Klock, and at Titusville, G. M. Lyons.

OMAHA.—Salaries, which have hitherto been small here, have recently been raised to correspond with those paid in Chicago. The work seems to grow heavier every day. On the night of Sept. 29, when the equinoctial storm swept with such fury over this part of the country, we lost Chicago, and about 2,000 messages hung on the overland hooks waiting for a turn in the tide. There are no signs of the Mutual Union here as yet, but we hope to see it enter the town by spring. Leith is here, fresh from Cheyenne. E. Dennison and Warren Tice have turned their faces toward the sunny South, where they will probably pass the winter. Men still come and go; each day brings a fresh arrival or sees one depart, and thus the poetry of motion is seen, felt and appreciated by the management. Huey is still with us. Vacancies have been filled by Messrs. Murphy, Sedgewick and others. Luke Fisher and Perry Chamberlain have decided to stay here all winter.

ST. LOUIS DIVISION, N. C. & ST. L. RY.—This road consists of 170 miles of railroad, and has 15 telegraph stations. Mr. W. P. Sweeney is train dispatcher for both divisions. At Kingston Springs, Mr. W. C. West is agent and operator; C. A. Arnold fills a similar position at White Bluff; Clayton Smith, ditto, at Dickson; J. K. Maret is operator at Gilleon; Robt. Hart, at Waverley; W. H. Johnson, agent and operator at Johnsonville, assisted by Mr. Harrison; J. S. Yarbrough is operator at Camden, Frank Brevard has charge at Hollow Rock, E. B. Teach-out is at Huntingdon, Geo. McKenzie at McKenzie; "Happy" Haynes Ayres (a distant relative of the great "Patsey") is at Dresden. At Martin we have J. I. Wilkes, agent and operator, with Mr. Parham as assistant. Mr. John Boyers is agent and operator at Paducah Junction, W. J. Hall manipulates at Union City, and J. C. Hellner is operator at Hickman, Ky., the end of the line. Mr. Archy Mack, the assistant train dispatcher is a late arrival, and is very popular. D. B. S.

Referring to the complaint made by O. M. Chesney, of Topeka, Kan., in THE OPERATOR of Oct. 1, in reference to his ill-treatment by Mr. H. C. Brown, of the Texas & Pacific Railway, Wild Bill Wagner writes to say that if Mr. Chesney had stuck to railroading long enough he would have eventually got a good position. "I started railroading," says Mr. Wagner, "four years ago, and have had a pretty rough time, but I chose to stand it and make my way. Operators from the North expect to come and get the best positions immediately, and when they find they have to work for a reputation they are very apt to exaggerate statements. As to Mr. Chesney's pay, he received double time for his work, and was not beaten out of a cent. Our officials are gentlemen and good business men. Mr. Brown has only been here a short time, and has proven himself a very competent gentleman, and is well liked. I make this statement in justice to Mr. Brown. He has nothing whatever to do with me, or I with him, only I know the facts above to be true."

OIL CITY (PA.) NOTES.—Several changes worthy of notice will occur in this office on or about Nov. 1, several of our best men leaving for different parts of the country. Mr. Klumph will probably go south; Sam McKee to Pittsburgh; Ed. Keene and Plum Brigham—the team who have worked the Bradford quad, for a number of years—to New York, where they go into the main office. This Bradford wire has been a very heavy one for a long time. On one occasion, several weeks ago, during a spurt in the oil market, 1,870 messages were exchanged between 10 A. M. and 4 P. M. (change hours). Keene and Brigham rank with the strictly first-class men of the country. Their work in every respect is excellent. Mr. Keene worked in New York five or six years ago. It is rumored that two old Oil Region boys, George Farwell and Bob Shannon, now of New York, are to fill vacancies in the O. C. office. Messrs. William Hunter, of Wheeling, John Hagan and C. E. Johnson are new

acquisitions. Colonel Drake, formerly manager Oil City office, is now at Pittsburgh with the W. U. SAMUELS.

WASHINGTON TERRITORY.—Mr. Ed. Bowden is the gentlemanly manipulator at Walla Walla for the W. U. Mr. J. H. Woollard is operator at the depot for the O. R. & N. Co. Mr. J. F. McElroy, formerly of California (weight 217 lbs.), is night man at Walla Walla. Mr. H. G. Stim-mel, lately from Kansas, is now agent at Waitsburg. Mr. Greenwood handles the W. U. and O. R. & N. Co.'s business at Dayton. Mr. Radcliffe is operator at Bolles Junction, Mr. Ed. Waring at the end of track. Mr. O. H. Joy is agent at Whitman, ably assisted by Mr. Fish as operator. Mr. J. Rogers is agent and operator at Fouchet; Mr. Charlie Erwin, "the genial," at Wallula Junction; Billy Teague and Mr. Lamb at Umatilla. Mr. Halleck, late of Portland, is now operator at Cayote. Mr. Davis, late of S. F., has charge of Willows station. Mr. F. P. Arbuckle, who comes from Kansas, is agent and operator at Alkali. Mr. J. H. Martin at Blalocks and Mr. John Cooper at Grants. Mr. J. V. Sutton is acting agent at Celilo. Mr. W. O. Gore is our efficient dispatcher, and has his office at The Dalles, where he is ably supported by Messrs. Parker and Don, alias J. Don-ley, formerly of S. F. office. J.

A correspondent at Cheyenne, Wyo., who commences his communication by saying: "THE OPERATOR, with its familiar pages overflowing with matter of interest to those connected with the telegraphic fraternity, finds its way safely here, but, as we depend a great deal upon it for the workings of 'the inner world,' it seems to reach us a little too seldom," appears to have fallen quite in love with the far West and the U. P. Ry. He says that before going West he had often wondered why complaints from that section were so few. After, however, mingling with "the boys" a little, listening to their musical Morse and learning their salaries, he says he doesn't wonder they are satisfied. "The lowest salary that the U. P. pays for day work is \$65 a month," he goes on, "and the salaries of night men have been increased to \$50. Paying enough to command good men, the U. P. employs no other. If dispatchers and train masters in localities where cheap labor is at a premium could listen to the Waltham movement of every department dependent upon the telegraph here, they could not help realizing the advantages of employing good men, paying them a fair remuneration. Many old timers will remember an operator whom the world knows as Bogardus. He is here, as ready as ever to relate wonderful tales. He is not in good health, but he's fretful and preevish, and seems to be drifting away toward the sunset of life."

## BORN.

GLENN.—Oct. 23, to Mr. J. A. Glenn, operator, Bay View Junction, Md., P., W. & B. R. R., a son.

SMITH.—Oct. 7, to Mr. S. H. (Bert.) Smith, W. U. Tel. Co., Halifax, a daughter.

## MARRIED.

WHITEMAN—STAUFFER.—October 15th, at Nappanee, Ind., by Rev. Tom C. Neal, Mr. C. H. Whiteman, agent and operator, Nappanee, to Miss Florence Stauffer.

HURLBURT—HACKETT.—On October 12th, at the Methodist church, North Sydney, C. B., by the Rev. J. B. Giles, Mr. C. W. Hurlburt, W. U. Cable Staff, North Sydney, to Mary M., third daughter of Mr. William Hackett.

JANKE—DEPUY.—October 11th, at St. Paul's Protestant Episcopal church, by Rev. J. F. Garrison, D.D., Charles A. Janke to Emilie Hooper, daughter of Mr. J. Stewart DePuy, all of Camden, N. J.

## DIED.

BRENNER.—September 30th, Mary Catharine, eldest daughter of Wm. F. Brenner, agent and operator, Alexandria & Fredericksburg R. R., Woodbridge, Va., aged 11 years.

CONNORS.—Oct. 21, at Toronto, Ont., after a brief illness, John J. Connors, of the Montreal Telegraph Co., aged 21 years.

# GILLILAND ELECTRIC MANUFACTURING CO.,

E. T. GILLILAND, General Manager, INDIANAPOLIS, Ind.

**STANDARD  
Magneto Bell.**

40,000 now in use.

This Secrecy Switch has many advantages over the old style. It can be attached to any or all of our Magneto Bells by a change in the connections and the addition of the Indicator, for in their construction this change was provided for. In all the Secrecy Switches heretofore made, it was necessary to turn the switch every time it was used, but with this latest improved, the Gravity Switch is employed. The Indicator controls the talking, and when set for the Exchange, no further attention is required until desired to talk in the opposite direction. When the Telephone is hung up, the line is restored for the use of others upon the same circuit, the Indicator simply governing the talking.

Additional to the superiorities it possesses as a Secrecy Switch, it has an excellent feature in that all of our Bells can be converted from a Gravity to a Secrecy Switch, or vice versa, and provide for the possibilities of the Individual Bell in the future.

**SECRECY SWITCH.  
STANDARD MAGNETO.**

TEN-LINE COMBINATION SWITCH BOARD.

## 10-LINE and 20-LINE SWITCH BOARDS,

For the club system of small towns and villages.

INVALUABLE FOR

State and County Institutions, Hospitals, Factories, Depots, Offices, Stores, etc.

Being complete, compact and handsome

our COMBINATION SWITCH BOARDS are universally used; the demand is extraordinary and continuous, giving satisfaction in every particular.

## 50, 100-Line & Upward SWITCH BOARDS

FOR EXCHANGES.

Over 1,200 of our Switch Boards in use in this country and in Europe.

## SUPPLIES OF ALL KINDS.

SEND FOR CATALOGUE AND PRICES.

Cell of battery, complete..... 65  
"Morse" Learners' Instrument, without battery, sent by mail..... 4.30  
(Battery cannot be sent by mail.)

GOODS SENT C. O. D. TO ALL POINTS IF ONE-THIRD OF THE AMOUNT OF THE BILL IS SENT WITH THE ORDER.

REMIT BY DRAFT, POSTAL MONEY ORDER, OR REGISTERED LETTER.

Favorable Arrangements Made With Agents Everywhere.

## THE "MORSE"

Is a full-size, well-made, complete MORSE TELEGRAPH apparatus of the latest and best form for learners, including handsome Giant Sounder and Curved Key, and a large Cell of the best Gravity Battery, latest form.

It is the best working set of Learners' Instruments for short or long lines, from a few feet up to 20 miles in length.

## YET OFFERED!

You are SURE of Getting  
THE BEST THAT IS MADE

IF YOU SELECT THE "MORSE."

We will in every case refund any remittance made us for these goods, if they are not found to be Entirely Satisfactory.

J. H. BUNNELL & CO., 112 LIBERTY ST., NEW YORK.

## THE WONDER OF THE AGE.

Piano or Organ  
playing learned in  
ONE DAY!

### MASON'S CHART.

A child 10 years old can understand it perfectly.

This most wonderful invention has been before the public (in its perfected form) but a short time and the sales have been immense, which is the surest test of its unparalleled merit; and orders are received from every country on the globe. It is a new theory, and a decided departure from the old method. **Mason's Chart** fits over the keys of a Piano or Organ, indicating exactly where and how the hands are to be placed, and the proper keys to strike, changing its position and arrangement to suit the key in which the piece is written that you wish to play. They are perfectly infallible in their results. If you can read you can play the Piano or Organ in one day better than some teachers could teach you in three months. If you have no Piano you can learn at some friend's house, and astonish all with your knowledge. **DEXTER SMITH**, the editor of the *Leading Musical Paper in the world*, says: "They should find a place in every house, whether there is a Piano or Organ or not. They are to *Musicians* what the *Multiplication Table* is to *Arithmetic*. It gives decided satisfaction in every case. It cannot do otherwise than *save as it does, a hundred times its cost*, and in its great simplicity lies its unequalled success. **MUSIC TEACHERS THEMSELVES UNHESITATINGLY ENDORSE IT.** The price is one dollar for a complete set (4 forms) and includes payment of postage by us. \$7 per doz. to Agents, or the trade by express. Special offer, to every purchaser of **MASON CHARTS** who will state in what paper they saw the advertisement, and will agree to show the Charts to their friends who will give as a **FREE PRESENT** our Music Album with 47 CHOICE PIECES OF MUSIC WITH COMPLETE WORDS AND MUSIC. Those wishing the Album sent by mail pre-paid will enclose 15 cts. extra, otherwise send by express. Price of Album without the Chart 75 cts. No one will regret learning to play the Piano or Organ, it is the greatest of all accomplishments. Address **Spaulding & Co., 57 WASHINGTON ST., BOSTON, MASS., Agents.**

## \$5. The Wonderful Mechanical Piano-ette.

The most marvellous mechanical invention of the age. It will play any tune in a melodious and pleasing manner. Difficult and simple music produced in a masterly style, and it can be played by a child as well as by a grown person and will furnish music for social gatherings of any description, playing hour after hour, without any knowledge of music being required in the operation. The most wonderful of all musical inventions; a machine which in a purely mechanical manner produces any kind of music, Waltzes, Polkas, Marches, &c., &c., without any practice or knowledge of music whatever; in this respect far superior to any music-box, for there is no limit whatever to the number of tunes it will play. The perforations in a flexible strip produce the effect. It has just been perfected (the accompanying cut showing it in its improved form), and is having the largest sale ever obtained by a musical instrument in the country. It has fine black walnut cases, highly decorated, the notes or bars (the music producers) are metal, on same principle as a tuning fork, which produce clear and most melodious notes, and never get out of tune; the bars are by strikers, the same as the wires are in a piano, only they work automatically instead of by the fingers. The strip of prepared which the tune is stamped or perforated, is about 10 inches wide, and as it passes through the rollers and over the keys, the spring through the perforations in the paper and strike the right note; this is all done automatically, without any assistance of operator (except turning the rollers), and the tune is played perfectly. It would be one of the most appropriate presents to one, especially where there is no other musical instrument. Its execution is admirable, and its capacity or capability almost limited. It is selling faster than any musical instrument ever invented. The music is fine, and everybody delighted. The price Piano-ettes only \$5, including a selection of popular tunes. Address, **The MASSACHUSETTS ORGAN** 57 Washington St., Boston, Mass., U. S. A., Sole Manufacturers.

## BEATTY ORGANS & PIANOS.

### BEATTY'S PIANOS.

GRAND SQUARE and Upright \$125 to \$1600.

WRITE FOR HOLIDAY CATALOGUE, ELABORATELY ILLUSTRATED. Address or call upon **DANIEL F. BEATTY, Washington, New Jersey.**

## \$7.50 THE OLIVER SHOT GUN & RIFLE \$7.50

Wonder and Admiration of THE SPORTING WORLD. The Handsomest and most complete Sporting Gun ever offered to the public, at any price.

By a simple and ingenious invention it is so constructed that it can be loaded with ball and shot cartridges at the same time. In placing this new Shot Gun and Rifle combined on the market, at a price far below that of other first-class Fire-Arms, we give the RETAIL PURCHASER the benefit of every possible reduction. The price we offer the Patent 5-SHOT Breech-Loading Rifle and Shot Gun at barely covers the cost of manufacture, but it will ensure a sale in every town in the United States, the result of which would take years of advertising to accomplish. The offer of the PATENT 5-SHOT BREECH-LOADING SHOT-GUN and RIFLE at our present low prices, holds good only for a limited time, and is for the purpose of introduction solely, in fact, if all our contracts for material and work had not been placed months ago, before the great rise in metals and labor, we could not make these FIRE-ARMS at the present cost. The PATENT SHOT GUN and RIFLE are WARRANTED and GUARANTEED to be thoroughly made and of as fine material as any Fire-Arm in the world! Every part is made by special and expensive machinery, in large lots. Fire-Arms, like Sewing Machines and Pianos have always paid an enormous profit to the manufacturer, the actual cost being but a small part of the selling price. The Patent Combination Breech-Loading Shot-Gun and Rifle will never be sold at the immense profit asked by the makers of other fire-arms, but only for the purpose of introduction will it be sold at the present price. We know this to be in the end the most effective and cheapest way to introduce a meritorious article. FIRES FIVE TIMES with one Loading and is very ACCURATE and EFFECTIVE at both Short and Long Distances. It can be loaded with either ball or shot cartridges in less than a half minute, and every shot discharged in six seconds if necessary. The barrel is manufactured from the best material and tested in the most careful manner, all the trimmings are Nickel Plated handsomely designed, Rocky Mountain Muzzle Sight, and the best of Steel Locks. This marvelous invention as a Breech Loading Shot Gun, has been pronounced equal to the best imported English Guns that are selling at \$100 each, and as a RIFLE it is warranted perfect. It is only by manufacturing these Patent Combination SHOT-GUNS and RIFLES in very large quantities that we are enabled to supply such an Excellent and perfect Fire-Arm for such an extraordinary low price! All other Breech-Loading and Repeating Rifles without the Shot Gun, retail from \$15.00 to \$50.00. We will send the PATENT 5-SHOT BREECH-LOADING SHOT-GUN and RIFLE COMBINED, with Cleaning Tools, for \$7.50, carefully boxed. If desired we will send Rifles C. O. D. on receipt of \$3.00 to insure us against loss of Express charges. When full amount of cash is sent with order, we will send cartridges free. Send money by Registered Letter or Post Office Money Order.

**WHAT CUSTOMERS SAY.**  
Find enclosed Draft for \$24.00 for three more Rifles. If they prove as good as the one I have I can sell a hundred. Oct. 7th, 1881. W. Z. Seawell, Neilville, Ark.  
Hundreds of Similar Testimonials.  
**Order at once. WORLD MANUF'G CO., 122 Nassau Street, New York.**

Rifle at hand. I enclose \$25.00 for three more balance in cartridges. Oct. 7th. A. S. Twitchell, Post Master, Gorham, N. H.

The Rifle proved highly satisfactory. Enclose \$15 for two more Guns. Sept. 21st. C. C. Foutch, Probate Judge, Gladwin Mich.

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

**SIMPLICITY AND EFFICIENCY**

## In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

**ADOPTED AND USED BY THE** American Bell Telephone Company. Metropolitan Telephone and Telegraph Company. Western Union Telegraph Company. Gold and Stock Telegraph Company, with their battery telephones. And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

**Infringements and Worthless Imitations.**

Every genuine Leclanche Battery has the words **Pile-Leclanche** stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

## The Leclanche Battery Co.,

40 West 18th St., New York.

# 1860. A MARVEL OF INGENUITY! A MODEL OF PERFECTION!! 1881. THE ACME PRINTING PRESS AND COMPLETE OUTFIT.

Delivered free anywhere in the United States on receipt of \$2.00.

In introducing our new Holiday Printing Press for 1881, we unhesitatingly proclaim the ACME PRESS the most perfect LITTLE WONDER ever yet brought before the public under the name of a Printing Press. We have been engaged in the manufacture of Printing Presses since 1860, and we will forfeit our 21 years' reputation if we do not prove that the work done on the ACME PRESS is equal in every respect to the same done by an experienced printer upon any high-priced printing press. DESCRIPTION—The Press is made entirely of Malleable Iron, japanned in black with Gold Stripes, ornamented in red and blue. The Type Chase is also of ornamented metal, silver-plated and surmounted by a polished maple wood Handle. The Press is mounted on a Solid Black Walnut Stand, to which it is firmly riveted, and upon which is also arranged an ingeniously constructed Inking Disc, by which device the Press is rendered absolutely SELF-INKING in its operation. ONE THOUSAND IMPRESSIONS PER HOUR can easily be made after a little practice. THE OUTFIT accompanying each Press consists of 1 Font of Fancy Card Type (this is a full regular font of ornamented card text type); 1 Box Fine Black Card Ink; 1 Lye Brush; 1 Adjustable Inking Disc; 1 Kid Centre Impression Pad; 1 Type Case with a separate compartment for each letter. The whole put up in a neat Wooden Cabinet with Drawer. Full illustrated directions how to set type; how to print, &c., accompany each press. Every Press Warranted. REMEMBER—We box and ship the Press and outfit, as above described, free of expense, on receipt of \$2.00. In ordering, it is best to send (Post Office Money Order or Registered Letter. Give your Post Office address, and state nearest Express office. Address ACME MFG CO. 53 Ann St., New York. Printing Press Manufacturers, Type Founders, Dealers in Printers' Materials, Chromo Goods and Cards of all kinds.)

## THE 'LONG DISTANCE' PATENT ELECTRIC CALL BELL.

"No Limit to the Distance it can be Operated."

OUR NEW PATENT CALL BELL is constructed on entirely novel principles, and has points of merit not possessed by any other electric or magneto bell. It is the perfection of convenience; requires a minimum of electric force, gives instantaneous assurance to the sender that his call has been properly made at the opposite end of the line, and the construction is such that a break in the line is IMMEDIATELY INDICATED AT BOTH ENDS BY THE AUTOMATIC OPERATION OF THE BELL.

We are now ready to supply the above call to Telephone Companies, Exchanges, Private Lines, or to any one wanting a CHEAP, DURABLE AND THOROUGHLY EFFICIENT ELECTRIC BELL.

Address,

THE LONG DISTANCE ELECTRIC CALL COMPANY  
257 and 259 Water Street, BROOKLYN, N. Y.,  
WHERE THE BELLS CAN BE SEEN IN OPERATION.

This Key has just been awarded the first prize at the Paris Electrical Exposition, Oct. 20, 1881.

## The Cumming Periphery-Contact Telegraph Key.

NO JAR OR STICKING POINTS.

CLOSE NEEDLE-POINT CONTACT.

RETAIL PRICE,  
\$4.40.

BY MAIL,  
REGISTERED,  
\$4.65.

(PATENT APPLIED FOR.)

The device consists in the placing of two wheels or discs swinging one upon the other, at right angles; one disc inside the arch of the lever and the other crosswise in the insulated standard. The electrical contact is attained on the rims or tires of these platina discs, instead of by the two wire points in general use for telegraph keys. These said discs are capable of a thousand surfaces by adjustment. The wheels are firmly held in place by small set screws working on the axles of the same. Advantages—The least possible contact surface which produces perfect electrical connection; circular surface of the rim; adjustability of the electrodes; no lateral motion; close contact and no jar.

This key has had unusual tests during the past five months, and has come out of the trial victorious. Every operator who has handled the Cumming Key testifies to the truth of these claims, and also as to its capability of giving the fastest transmission under the strongest battery without sticking. It is the most economical key any company can use for, saving time and avoiding mistakes. It contains many keys in one by having so many possible points of contact on each wheel easily adjusted. Upwards of 200 autographic testimonials by experts and operators, placing its merits at the highest, are offered for inspection by the inventor, GEORGE CUMMING, 303 East 19th street, New York.

Sample Key Sent Post-paid on Receipt of Price.

## MANNER OF SETTING UP AND OPERATING Post & Co.'s "Improved Switch Board."

Please examine thoroughly. This Board has been perfected at great expense, and after thorough trial as to its practical working, the contact points (rubbing) are so made as to clean themselves by each connection—a very important point. The Board is simple and substantial, NO CORDS TO BREAK, nothing to get out of order; it can be run by a Child, and the connections made as quick or quicker than by any other table.

THE OPERATION OF THE TABLE IS AS FOLLOWS:

A call comes in and drop No. 4 will fall, showing party desiring to talk. You answer by taking out plug No. 1 on his line and insert in second strip on board No. 2. Then move treadle, which answers subscriber by a ring. After answering, push the large button No. 7, on the lower right-hand corner, when you are thrown in circuit with microphone and telephone. After answering and asking what is wanted, take the same plug, No. 1, that you first used and insert in any of the ten strips, No. 3, that is not in use. Call up the party that is called for in the same manner above described.

TRUNK LINES, A, B, C, D, E and F. Tables having trunk lines are operated in the same manner as described, with this exception: that when parties are wanted on any other tables connect in strips marked A to F on any table desired. Can make connections for any number of additional tables of five lines each.

TABLES—Black Walnut highly ornamented and veneered.

Send for Illustrated Circular.

**A. G. DAY,**

MANUFACTURER OF

**Kerite Insulated Telegraph  
 Wire and Cables.**

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

### DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

### Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, Sir WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

**Kerite Insulated Wire and Cables**

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
 of the Insulator."

For sale by all dealers in Telegraphic Materials.

## THE "LATTIG" [AUXILIARY LEVER] KEY.

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very finely finished, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the endorsement of the best operators in the country. It embodies the only true principle to prevent a key from sticking, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of sticking keys. We claim this key will never fail to make contact.

## "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY OF BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

## The Giant Sounder Perfected.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

# THE OPERATOR

is published semi-monthly—on the 1st and 15th of each month. It is devoted to telegraphic news, commercial, railroad and telephonic branches, social as well as scientific; it is a record of the wonderful growth and progress of the telegraph and telephone, and a faithful chronicler of all the changes and improvements in electrical science.

## WHAT SUBSCRIBERS GET.

THE OPERATOR in the course of a year furnishes its readers with 24 numbers, each containing an average of 20 pages of interesting reading matter, being 480 pages, or 1,440 columns during the year. This is equal in one year to at least 2,500 PAGES OF AN ORDINARY BOOK. In addition to being kept fully informed on every matter of interest to them occurring at home or abroad, subscribers, by saving their copies, can readily turn to dates and events with which it might be desirable at any time to refresh their memories. More or less complete files, bound or unbound, are always salable, and generally bring many times their original cost.

## IMPROVED, INCREASED IN SIZE, BUT REDUCED IN PRICE.

THE OPERATOR has been enlarged and improved until it is now eight times as large as (and certainly of at least eight times more value and general interest than) it was when first started. Yet the price to-day is actually LESS than it was then. In fact, the paper is now furnished to subscribers at a price that DOES NOT COVER THE BARE COST OF PRODUCTION, our object being to secure a large circulation, and trust to advertising for our profits.

## THE GROWTH OF "THE OPERATOR."

Any one who will take the trouble to compare the little four-page OPERATOR of seven years ago with the twenty-four page, cosmopolitan journal of to-day, will see the vast improvement. The paper was then managed by two working operators in the intervals between more serious undertakings. It now occupies the undivided attention of several business men and a large editorial corps, and circulates in every quarter of the globe, wherever the telegraph is worked. We are still anxious to make THE OPERATOR as efficient as the unstinted expenditure of money and the exercise of diligence and discrimination, with the aid of every modern appliance, can make it; and we hope that those who have found instruction or pleasure in its columns in the past will repay us for our efforts by giving us their co-operation in our endeavor to place a copy in every telegraph office and telephone exchange in the United States and Canada. The greater its circulation the stronger will be its influence, and a journal devoted to the interests of the toiling operator can never be too strong.

## A STALWART, UNCOMPROMISING JOURNAL.

THE OPERATOR is a stalwart, uncompromising telegraphic journal. Its cardinal principles are honesty of purpose, integrity in business affairs, courage, independence, genius and industry, and its chief aims are to elevate the profession, to popularize electrical science, and to cement the fraternity in one compact body, thus rendering it proof against assault from all quarters. THE OPERATOR has already become known as the sturdy friend of the widow and orphan, the unfortunate and oppressed, wherever found.

## AN AVERAGE OF 61 COLUMNS OF MATTER PER ISSUE.

Acting upon these principles, and in order to accord the widest range to every subject, THE OPERATOR has, from the first of January last until the present issue, Nov. 1, ten and a half months, published

## 428 PAGES OF SOLID, SUBSTANTIAL READING MATTER,

being an average of 20½ pages, or 61 columns for each issue. Every issue has been teeming with news, scientific essays and the social gossip of the profession, including the airiest fancies and the gravest facts, but all worthy of the culture and great intellectual power now so marked in our profession.

## CAREFULLY AND CONSCIENTIOUSLY EDITED.

THE OPERATOR is carefully edited in every department by a large and well-chosen editorial staff, which includes some of the finest telegraphic statisticians, astute thinkers and philosophers in this most remarkable business. We regard it as our peculiar province to find out at any cost what is going on telegraphically; to make it public in a truthful and lucid manner; to expose shams and frauds of all kinds, high or low; to give praise where praise is due, irrespective of prejudice, and to do some courageous and vigorous thinking thereon. As every item is, as far as possible, tested and proved before being printed, we find our editorials largely quoted, both at home and abroad, as authority upon all telegraphic subjects. Under the title of "editorial" we might also, perhaps, class a subject which is now attracting wide attention for its conciseness, truthfulness and sweeping scope, viz.: The

## "REVIEW OF THE PAST TWO WEEKS,"

covering all telegraphic events of importance, and the doings and sayings of those who are written and read about.

## A FAITHFUL RECORD OF CURRENT EVENTS.

THE OPERATOR also aims to be a complete record of the births, marriages, deaths, appointments, promotions, transfers, resignations and all the social gossip of the profession, refraining, however, from all that might be injurious or offensive to innocent or well-meaning persons. It maintains

## INTELLIGENT AND LIVELY SPECIAL CORRESPONDENTS

at all important telegraph and telephone centres; on the frontier, in Europe and the Pacific Archipelago; and it uses the telegraph freely for news of events transpiring a short time before going to press.

## CONDENSED PRACTICAL SCIENTIFIC INFORMATION.

While not aiming to be severely scientific, THE OPERATOR's "Scientific Column" contains a carefully prepared epitome of all current thought and experiment in electrical matters, as communicated to us by our leading scientists, or culled from the scientific journals of America and Europe. Foremost in this department are the excellent

## "NOTES AND QUERIES" OF MR. T. D. LOCKWOOD,

which have won a well-deserved place in the record of electrical science. These articles, plainly written, form one of the most efficient helpers for a young man desirous of studying the science.

## LONG SEMI-MONTHLY LETTERS FOR 4 CENTS EACH!

Just think of this: If you had a friend who proposed to send you twice a month a long letter, containing all the news and other information mentioned above, and such other matters connected with your business as it was to your interest to know, and if he agreed to do this for ONE DOLLAR A YEAR—less than sufficient to pay for writing paper and postage—and you knew that he was perfectly responsible and would do as he promised, don't you think it would be rather short-sighted on your part not to accept his proposition? Yet that is precisely what THE OPERATOR offers to do, and is doing, although it spends THOUSANDS OF DOLLARS A YEAR in carrying out the contracts.

## WHY EVERY OPERATOR SHOULD READ "THE OPERATOR."

It is controlled by no company or faction, and aims solely to serve the best interests of the telephone and telegraph employees. The average newspaper, propitiated with liberal orders for advertising, never dares to give the true state of affairs with regard to the working operator; indeed, it may truthfully be said that the American telegrapher never had a journal say one word in his behalf, and never had any influence or weight in telegraphic affairs until he commenced to do his own printing. All the traditions, all the history, and even the very existence of THE OPERATOR depend upon the great rule of allowing

THE LOWEST OPERATOR AN EQUAL CHANCE WITH THE HIGHEST OFFICIAL to "speak his piece," and to spread his suggestions and grievances before his superior officers or fellow-workers. In fact, all the thoughts, all the aspirations, and all the hopes of the profession were utterly lost until THE OPERATOR caught them up, bound them into sheaves and preserved them by "the art preservative of all arts" for all time.

As an organ of opinion, THE OPERATOR is

## FIRST, LAST AND ALL THE TIME FOR OPERATORS AND THEIR BEST INTERESTS.

Telegraphic and kindred topics are recorded and discussed as they arise, while its record in defending the widows and orphans of unfortunate telegraphers requires no comment. While it is a well-known, staunch supporter of the members of our craft, it is, at the same time, never to be blinded to their faults, if any are found to exist; and, believing it is better to touch and heal, to cast out and chastise those who are unworthy of confidence, it points them out,

## NO MATTER WHAT POSITION THEY MAY OCCUPY.

While aiming to expose, and so to correct, all that is deceptive, unjust or corrupt in official life, we do not regard it as productive of good results to the profession at large to give these unpleasant matters undue prominence before an effective effort is made privately to correct them.

But, to the toiling operator, clerk and lineman THE OPERATOR should need no word of indorsement; for, as the accredited organ of the profession, it has advanced so far in prosperity as to be

## ABSOLUTELY INDEPENDENT OF ALL OFFICIAL INFLUENCE,

as well as cliques and factions of all kinds. THE OPERATOR has never yet hesitated to face any emergency, no matter from what quarter it came. The position we take on any question is the one which seems to us to be for the best interests of the profession and of the fraternity, and any threat or pressure tending to make us swerve from

## THE TRUE PATH OF CONSCIENTIOUS DUTY AND PROFESSIONAL ETIQUETTE

can have no possible effect in changing our course.

There are also other reasons why THE OPERATOR justifies the generous support which it now receives. The wonderful fecundity of our inventors, whose discoveries are following rapidly one after the other, and the great number of gigantic enterprises already projected, present

## A WIDE AND PROMISING FIELD FOR THE AMBITIOUS

and promising young man. Now, it stands to reason that the operator who does not read his class paper must soon become a kind of telegraphic Robinson Crusoe. He must necessarily remain

## IGNORANT OF THE PROGRESS OF TELEGRAPHIC EVENTS,

and it is certain that no one who is badly informed on this subject can ever hope to raise himself above the level of the ordinary ruts of daily life. Therefore, no operator who expects to

## PROFIT BY THESE ENTERPRISES,

or even to secure for himself a better-paying situation in the thousand and one changes which these new plans, schemes and ever-changing combinations produce,

## CAN AFFORD TO MISS "THE OPERATOR" FOR A SINGLE ISSUE,

since he cannot in any other way be made acquainted with his general prospects; and the odd number which he misses may be the very one which would otherwise have given him the hint that led on to fame and fortune.

## THE NATIONAL PORTRAIT GALLERY AND OTHER ILLUSTRATIONS.

This year, so far, THE OPERATOR has published pictures of Gen. Eckert, Messrs. Bates and Doren—the trio that made the American Union famous—Theodore N. Vail, General Manager of the American Bell Telephone Co., all full-page illustrations; Operators Albert S. ("Patsey") Ayres, of Cincinnati; William D. West, of New Orleans; P. J. McMahon ("Paddy Mack"), of Boston; John C. Sherer, of California, and John Lenhart, the Citizen of the World. Besides these, the present volume has produced some splendid illustrations, with full description, of the Chicago Police and Patrol system, and other matters of current news.

## REVIEWS AND ESSAYS

of great interest and intrinsic value appear in each issue, while the occasional humorous articles of "Werner" are too well known to need commendation.

THE REVIEW OF THE YEAR 1880, published in our issue for January 1, 1881, is alone worth a year's subscription to the studious telegrapher.

## CONTENTS OF ONE VOLUME.

The back numbers for the current year also contain an exhaustive review of the Consolidation of the Western Union and American Union Companies, and the ensuing lawsuits; the effort of the Postal Telegraph advocates; full and dazzling accounts of the Paris Electrical Exhibition and the Congress of Electricians at the same place (THE OPERATOR having had a special correspondent in the Palais de l'Industrie during the whole of the Exhibition); gradual progress of the telegraph and telephone; valuable statistics and important and most interesting comparative statements; financial reports; railroad telegraphs; salaries paid; fast sending—time made and number of words sent in a given time; new companies formed; biographies and obituaries of noted men and women; the electric light; new inventions; telegraphic and telephonic conventions, telegraphic journalism; the telephone, in all its phases; ocean cables; remarkable anniversaries, and the progress of the telegraph in England, the continent of Europe, India, Australia, South America and all other places abroad.

## PROMPT SERVICE AT AN INSIGNIFICANT COST.

All this reaches you regularly, just as a faithful correspondent would write you a long letter by mail twice a month, and costs you only four cents a letter! In providing for this slight expense, there are many small outlays which could be abolished to counterbalance the cost. You might dispense with the daily papers, and you might even get along without your local paper, but you ought not to think of being without the journal of your own profession—the operators' organ—the only paper in the world published in the interests of the fraternity of which you are a member. The price,

## ONE DOLLAR FOR A WHOLE YEAR,

is nothing compared with the benefit you will receive from a perusal of THE OPERATOR during the next twelve months.

## WHY ALL WIDE-AWAKE OFFICIALS SHOULD READ "THE OPERATOR."

No official organ of any particular company can ever be of use in guiding the wide-awake official. It is admitted that nothing in the newspaper world could have less influence than an "official organ," since its recognized position and common fame put it in the light of piping always to the same creaking key; and its reports being always colored are consequently utterly valueless as matters of record. THE OPERATOR, on the other hand, looking merely at its independent position, must be an admirable corrective instrument, for the better class on both sides study its reports, and all admit that it is the fairest field for friendly controversy, exhortation, explanation and good-natured criticism regarding all that pertains to the interest of telegraphers. It is, as has been well said of the press in general, like an eruption of Vesuvius—a sort of safety-valve by which ideas and feelings which, if they remained imprisoned, would result in earthquake, are released, ejecting with them a good deal of mere steam, a great quantity of ashes, and a certain amount of lava, which, by its crumbling ultimately covers the soil with smiling vineyards and benefits to mankind.

These facts are gradually becoming understood among officials, and the journal which, in a manly, straightforward way, tells them when they are wrong commands their respect. THE OPERATOR is the

## ONLY COMPLETE INDEX OF AMERICAN TELEGRAPHIC LIFE,

a continued story of our thoughts and actions as a body, without a knowledge of which any one is unfit for successful telegraph leadership.

## WHY ALL TELEPHONE MEN SHOULD READ "THE OPERATOR."

The progress of the telephone has been such, and so many of our very best men have gone over to that branch of our profession, that it demands especial attention at our hands. We have, therefore, commenced a new department of this paper, devoted exclusively to the telephone, its rise and progress, and every-day gossip in connection therewith. We receive regularly items of this kind from the various telephone exchanges throughout the country

Indeed, the Telephone Department of THE OPERATOR jumped at once into popular favor, and is now eagerly read by the members of that important and fast-growing branch of telegraphy. In the present volume are to be found complete accounts of the famous litigation between the English government and the telephone people; the telephone conventions, with much interesting data, and a record of long-distance telephoning. The lucid and elaborate papers of Mr. T. D. Lockwood, discussing practical telephonic subjects in popular language, are so well known and are so deservedly popular among telephone men as to need no comment here.

#### WHY EVERYBODY SHOULD READ THE OPERATOR.

A profession like ours, growing daily, hourly, and with its various branches in the telephone companies, the railroads and Signal Service, the working members of all of which are unsurpassed in activity, ingenuity and the importance and effectiveness of their work, should support a FIRST-CLASS, THOROUGH-GOING, INDEPENDENT PAPER, to be spread broadcast over the civilized world.

SCIENTIFIC MEN AND STUDENTS SHOULD READ "THE OPERATOR," because it is a complete, connected and well edited record of electrical progress. Avoiding the redundant fulness and dry details of scientific research, it is careful to preserve the important facts in all that it is necessary for the scientific student to know. Ever since the introduction of the telegraph, men have been writing voluminously upon electrical subjects, but their efforts have been rather too deep for the ordinary student. Our articles are, therefore, written with a special desire to avoid that great stumbling block to the acquisition of electrical knowledge; to disentangle the multiplicity of knotty questions and to

PRESENT THEM STRAIGHT AND SMOOTH TO OUR READERS, thus affording the junior members of our profession an opportunity of mastering, in an easy way, the most intricate questions.

#### A WORD FOR OUR ADVERTISERS.

The support so generously given to THE OPERATOR has enabled us to print, each issue, many extra copies for circulation abroad, in addition to our regular edition, until the paper is now mailed regularly to all parts of every State and Territory on this continent, and to every country abroad, wherever the English language is read. The reduction of our subscription price to ONE DOLLAR A YEAR, together with the attractive make-up of the paper, and the fearless, enterprising and reliable attitude which it assumes, have made it a great favorite, and promise to induce

EVERY TELEGRAPH AND TELEPHONE MAN IN THE UNITED STATES AND CANADA to become a subscriber; in fact, the paper is more than keeping pace with the existing development of the telegraph.

THE OPERATOR has now the largest circulation among regular paying subscribers of any telegraphic paper in the world. It is, therefore,

#### A VALUABLE FIELD FOR ADVERTISERS,

and, in connection with the reasonable rates which we afford them—for, notwithstanding that OUR CIRCULATION HAS MORE THAN DOUBLED DURING THE PAST YEAR, our advertising rates have not been increased—it forms the very best means of spreading their wares before the world.

#### TERMS OF SUBSCRIPTION

INVARIABLY IN ADVANCE):

One Copy, One Year, Postage included, - - - \$1.

The Postage to any part of the United States, or the Dominion of Canada, is always prepaid by the publisher, and addresses changed as often as desired, without extra expense. To foreign countries in the Universal Postal Union—which includes Newfoundland, Eng-

d, France, Germany, Australia, etc.—the price, postage prepaid, is only \$1.25 per annum. To countries not in the U. P. U., the subscription is \$1.50.

We much prefer yearly subscriptions, and they are more satisfactory to subscribers themselves, but to those who desire to subscribe for a shorter period we will mail the paper, postage prepaid, for nine months, for 75 cents; six months for 50 cents, or three months for 30 cents.

Should any difficulty arise in procuring copies, direct communication with the publisher is requested. Specimen copies, singly or for getting up clubs, mailed free on application to the publisher. In case subscribers should at any time fail to receive their copies of the paper regularly and promptly, they have only to notify us, when the matter will be immediately investigated and remedied.

Should you change your residence at any time—no matter how often—you have only to notify us and the paper will be sent to your new address. We prepay all postage, too, so that you have no further expense of any kind, except the subscription price, and you are under no obligation to take the paper for a longer period than that for which you pay. If the subscription be not renewed when it shall expire, the paper (as is our invariable custom) will promptly be stopped.

Subscriptions can commence at any time.

We will send THE OPERATOR from November 15, 1881, until January 1, 1883, postage prepaid, for ONE DOLLAR.

Send in your name at once and take advantage of the above SPECIAL OFFER.

#### INSTRUCTIONS ABOUT REMITTING.

A one dollar bill, in an ordinary unregistered letter, addressed to W. J. JOHNSTON, PUBLISHER, No. 9 MURRAY STREET, NEW YORK CITY, will almost unquestionably reach us. Larger amounts should be sent by post-office order, draft, registered letter or express, in which case they are at our risk. For fractions of a dollar, or where it is inconvenient to send cash, U. S. 1, 2 or 3 cent postage stamps will be accepted. If Canadian postage stamps are remitted, 12 per cent. additional should be sent to cover discount on them here. Canadian currency will be accepted at par. Don't send mutilated or worn-out currency. Silver, except in small amounts, should not be sent in an unregistered letter. It is always more satisfactory to send remittances to the publisher direct, in which case you will know that the money will be received and the order promptly attended to.

Many would doubtless like to send for THE OPERATOR who are deterred by the supposed great trouble and risk of sending money by mail. The fact is, however, that there is very

#### LITTLE TROUBLE AND ALMOST ABSOLUTELY NO RISK

in ordering in this way. We get thousands of letters every year ordering the paper and some of our books, and it is very rarely indeed, either that a letter sent to us goes astray (and then only when the sender has addressed it incorrectly), or that a package mailed by us fails to reach its destination. If you have never hitherto ordered anything from New York, send us an order now for THE OPERATOR and some of our books, and you will see that they will reach you by return mail. All orders, unless in cases where there is a necessary delay, such as in the printing of names on cards, are attended to and sent by mail or express the same day they are received. Be sure to give your full name and address, and you will have no trouble about receiving the goods promptly. Should they, however, for any reason, not reach you in a reasonable time, drop us a postal card and we will ascertain the cause of delay and rectify it. REMEMBER, WE PREPAY POSTAGE ON ALL OUR PUBLICATIONS—BOTH THE OPERATOR AND THE BOOKS.

Remit by post-office order, draft, registered letter or express. U. S. postage stamps taken. Address communications and make orders payable to

W. J. JOHNSTON, Publisher,  
NO. 9 MURRAY STREET, NEW YORK.

## A Magnificent Work for a Holiday Present!

# POEMS OF WILLIAM WORDSWORTH

Edited, with an Introduction, by Richard Henry Stoddard.

320 Large Pages, Elaborately Illustrated. Cloth, Gilt Edges, Price \$3.00.

This is the most pretentious volume we have yet attempted. Every illustration it contains was engraved especially for it, by the foremost of American engravers. There are no fewer than 74 engravings in the book, and they are all large, nearly every one being what might be called full page.

The book is unusually prettily bound, with a profusion of gold on the side and back, and gilt edges. The design for the cover was made especially for it, by an artist whose reputation for such work is national.

For the purpose of securing the proper margin, the paper—which is thick, fine and of a rich cream tint—was also made to order; and throughout no expense was spared to add to the beauty, value and attractiveness of the book.

### This is no Reprint of an English Edition.

The cuts are all new and the plates made from new type. No such elaborate edition of Wordsworth has ever been published on this side of the Atlantic. Similar works published in England, not any handsomer than this, and, indeed, not so handsome, cost from \$9 to \$12 a copy. The price of the present volume, however, puts it within the reach of every telegrapher wishing to make a holiday present. The book is all ready and orders will be filled as soon as received.

Agents Wanted for the New Book, to whom we will allow liberal commissions. Telegraphers can sell large numbers before the holidays.

"The Operator" for One Year and a Copy of Wordsworth will be Mailed Together, Postage Prepaid, for \$3.50.

"Tales and History," or any of our other \$1.00 Books, at the same Price.

"Tales and History," "Christmas Evergreens" and "Wordsworth," \$4.50.

All ten books we publish (nine cloth; Telephone and Oshkosh, paper), postage prepaid, only \$7.50. THE OPERATOR one year and all ten books for \$8.00.

# A CHEAP, SEASONABLE AND ELEGANT WORK! CHRISTMAS EVERGREENS.

A COLLECTION OF CHOICE

TELEGRAPHIC AND GENERAL POETRY,  
SUITABLE FOR A

HANDSOME HOLIDAY PRESENT.

Illustrated by a Frontispiece and Fifty Fine Engravings.

HEAVY TINTED PAPER. CLOTH EXTRA. FULL GILT. PRICE, \$1.50.

**CHRISTMAS EVERGREENS** has been so ENTIRELY RE-ARRANGED, by the addition of much new matter—including a dozen fine cuts and a beautiful frontispiece—that it is now virtually a new book and, the publisher thinks he can safely claim, at least as handsome a volume at the price as has ever been issued by any publisher, American or foreign.

Indeed, an examination will demonstrate that the edition of "Christmas Evergreens" for this year compares very favorably with any of the ordinary three, four, or even five dollar holiday books, either as to contents, illustrations, typographical appearance, paper, printing or binding.

## LIST OF AUTHORS:

HENRY W. LONGFELLOW,  
JAMES MONTGOMERY,  
ALFRED TENNYSON,  
BENJAMIN F. TAYLOR,  
OLIVER GOLDSMITH,  
I. McLELLAN, JR.,  
MEDORA CLARK,  
A. C. BOLTON,  
JANE TAYLOR,

WILLIAM CULLEN BRYANT,  
WILLIAM WORDSWORTH,  
SIR HENRY WOTTON,  
GEORGE T. LANIGAN,  
SARAH E. HENSHAW,  
WILLIAM KNOX,  
THOMAS GRAY,  
J. C. SHERER,  
ELIZA COOK.

## OPINIONS OF THE PRESS ON "CHRISTMAS EVERGREENS."

A very pretty compilation.—*N. Y. Evening Post.*

The poetic selections are of the very best character.—*Providence Press.*

The book is well illustrated and handsomely printed.—*Boston Transcript.*

Engravings superior and typographical appearance excellent.—*Philadelphia Record.*

Prettily bound and reasonably priced, \* \* \* comprising gems from many of the first American and English poets, accompanied with a profusion of wood cuts on varied subjects.—*Publishers' Weekly.*

We can indite no word notice of this volume that will do justice to its merits. It is a beautifully printed and bound souvenir for the holiday season, and is among the rarest and best of that class of literature.—*Washington Republican.*

The book contains specimens of the choicer productions of Bryant and Longfellow, Goldsmith, Gray, Montgomery and other prominent English poets, is neatly illustrated, and furnishes an acceptable gift at a moderate price.—*N. Y. Tribune.*

"Christmas Evergreens" is an elegant, full gilt, well-printed and finely illustrated volume. It displays excellent taste in mechanical execution, while its poetic selections are of the very best character. Many of the selected pieces are old favorites which will continue to hold their place in the affections of the lovers of true and elevating poetry for many centuries to come. The volume makes a fine Christmas present.—*Providence Star.*

PRICE REDUCED TO ONE DOLLAR.

# Lightning Flashes and Electric Dashes,

A VOLUME OF

Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.

CONTRIBUTED TO BY

ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.

COPIOUSLY ILLUSTRATED.

176 Large Octavo Pages. Cloth. Price, \$1.

This book is a lasting example of the literary talent and native wit of American telegraphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader.*

"Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic.*

"The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent.*

"Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist.*

THE OPERATOR, 15 Months, and Lightning Flashes, only \$2.00.

Address,

W. J. JOHNSTON, Publisher,  
No 9 Murray Street, New York.

# Telegraph and Telephone New Year's Calling Cards, 1882.

For the last four years we have prepared each year New Year's Cards for telegraphers. Our object has been to give the fraternity a distinctively telegraphic New Year's Card, one that was neat, pretty, appropriate; different from any other New Year's Card, and so unique and handsome as to attract attention and deserve preservation. Our success has been much greater than we could have expected, and this year we have, in addition to those for telegraphers, also one for telephone men.

Every telegraph or telephone man who expects to make New Year's calls should have some of these cards, and those who don't should have some anyway and mail them to their friends. The cards can be used by ALL TELEGRAPHERS AND TELEPHONE MEN respectively—managers, operators, clerks, bookkeepers, receivers, linemen, messengers and others.

## PRICE LIST.

25 cards, with one name, mailed to any address on receipt of	\$ 35
50 cards, with one name, " " " " " "	50
25 cards, without name, " " " " " "	25
125 cards, without name, " " " " " "	1.00

Cards furnished by the thousand at special rates.

There will be no delay in filling orders. The cards will be mailed in each case as soon after receipt of the order as it is possible to have the name printed. Order early. U. S. postage stamps taken. Samples of either the Telegraph or Telephone Cards mailed on receipt of 2c. stamp. Samples of New Year's Cards and messengers' addresses on receipt of 3c. stamp.

25 New Year's Cards, with name, or 25 Messenger Addresses, will be mailed free to any one sending us two yearly subscriptions for THE OPERATOR. Their own and that of a friend will do.

# Telegraph Messengers' Christmas and New Year's Greeting, 1881-82.

These addresses can be used either at Christmas or on New Year's day, as the messengers many prefer. They are suitable for the messengers of ANY telegraph company. They are for presentation to patrons of the telegraph, merchants and others; and messengers will find them neater and handsomer than anything of the kind heretofore used for this purpose, and cheaper than they could possibly get them printed for in their own towns.

## PRICE:

25 Copies, postage prepaid, only	\$0.35
50 Copies, " " " "	0.60
100 Copies, " " " "	1.00
250 Copies, " " " "	2.25
500 Copies, " " " "	4.00
1,000 Copies, " " " "	7.00

Order early; U. S. postage stamps taken. Samples mailed on receipt of a 2c. postage stamp. Sample of both the Messengers' Address and of the New Year's Cards will be mailed on receipt of a 3c. stamp.

Messengers are recommended to order a supply of our Telegraphers' New Year's Visiting Cards, with their name printed on them, to be presented in connection with the Messengers' Address. We will send 25 addresses and 25 cards on receipt of 60c; 50 addresses and 50 cards on receipt of \$1.00, or 125 addresses and 125 cards on receipt of \$2.00.

## DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together the purchaser may deduct

25 Per Cent.

from the regular retail price before remitting. The books will then be forwarded, postage or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and THE OPERATOR for fifteen months in connection with any one dollar book for \$2.00.

# How Enterprising Operators may Add to their Incomes.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

W. J. JOHNSTON, Publisher,  
No. 9 Murray Street, New York.

## HOW SOME OF OUR BOOKS MAY BE SECURED FREE.

Although the subscription price of *THE OPERATOR* is so low that little margin for liberality remains, yet to any one sending us a club of four yearly subscriptions (old or new)—their own and three others will do—we will mail, *free and postage prepaid*, as a premium, a copy of either "Telegraphic Tales and Telegraphic History," the Dictionary, "Lightning Flashes," "Christmas Evergreens," or "General Grant," bound in cloth, or a copy of *THE OPERATOR* for one year.

Any two of these books for a club of eight yearly subscriptions; any four for fifteen yearly subscriptions; or the five for eighteen yearly subscriptions.

To any one sending us three yearly subscriptions as above, we will mail a copy of "Oakum Pickings," cloth, "Wired Love," cloth, or "Sam Johnson," paper.

To any one sending us two yearly subscriptions, as above, or their own and that of a friend, we will mail a copy of "Oakum Pickings," bound in strong paper, or a copy of "Telephone and Oshkosh."

All 9 Books for 25 Yearly Subscriptions.

A Silver Watch for 60 Yearly Subscriptions.

A Gold Watch for 160 Yearly Subscriptions.

We are anxious to secure a very large number of agents everywhere, both for *THE OPERATOR* and for the books we publish. Those in a position to act for us will oblige by making a beginning at once.

Should specimen copies be desired, drop us a postal card and they will be immediately mailed you free.

## Telephone and Oshkosh: TWO SPARKLING TELEGRAPHIC BURLESQUES.

By THOMAS C. NOBLE, JR.

32 Pages. Paper. Price 25 Cents.

"Telephone, and Her Dad who Loved to Whistle Her" is considered the finest Pinafore burlesque extant. "The Carnival of Oshkosh: a Tragedy in Three Acts" is equally as bright and witty. They will be read with peculiarunction by telegraphers. Both complete for 25 cents.

## OAKUM PICKINGS:

A Miscellaneous Collection of Stories, Sketches, Essays, and Paragaphs, Telegraphic and General, By Walter P. Phillips, "John Oakum," with a fine Steel Plate Portrait of the Author.

Fourth Edition, 188 pp.; Medium 12mo; Paper, 50c.; Cloth, 75c.

The welcome accorded this, the first book ever published with the object of giving the telegraph profession a literature of its own, has been general and hearty, on the part of both telegraphers, press, and general reading public in all parts of the country. Mr. Phillips, the author, is well known to the fraternity as a spicy, original, witty, entertaining, and popular contributor to telegraphic and humorous literature, and his character sketches of "Jim Lawless," "Tip McClosky," "Posie Van Dusen," "Cap. De Costa," etc.—all of which are contained in *Oakum Pickings*—have won for him an enviable reputation as a humorous sketch writer.

## SPECIAL AGENTS' OUTFIT.

Experience has demonstrated that the best selling books we publish are

WORDSWORTH,

CHRISTMAS EVERGREEN,

TALES AND HISTORY,

THE DICTIONARY,

WIRED LOVE AND

OAKUM PICKINGS.

That agents may be equipped for taking orders at an insignificant cost, we will send all of these books, each bound in cloth, for use as samples, prepaid, on receipt of \$5 (regular price \$8).

"THE OPERATOR" for fifteen months can be added to the above for one dollar extra.

W. J. JOHNSTON, Publisher,

9 MURRAY STREET, NEW YORK.

## SAM JOHNSON:

The Experience and Observations of a Railroad Telegraph Operator.

By J. ALBERT CLIPPINGER,

Author of "The Pedagogue of Widow's Guich," "Samson" Papers, etc.

176 Pages. Price, in Paper, 75c.; in Cloth, \$1.

This book consists of a series of short stories or sketches, illustrative of the checkered life and experience of a representative Railroad Telegraph Operator—a near view of the daily and nightly working of the busy bees who manipulate the two greatest agents of modern civilization—electricity and steam.

"Sam Johnson is one of the most entertaining books in the whole library of railroad literature. It is a series of well-told sketches and stories relating to every phase of railroad life. Some are humorous, some thrilling, some pathetic, and all interesting. The book is written by a practical railroad operator, with a ready pen and a quick eye for the salient points of a joke or incident."—*Railroader*.

THE FIRST AND ONLY TELEGRAPHIC NOVEL!

## "WIRED LOVE:"

A ROMANCE OF DOTS AND DASHES.

BY ELLA CHEEVER THAYER.

The "Old, Old Story" in a New, New Way.

256 PAGES. HANDSOMELY BOUND IN CLOTH. PRICE 75 CENTS.

Having already issued the THIRD EDITION of this admirable Telegraphic Love Story (which fact sufficiently demonstrates its popularity, both in and out of the profession), Mr. Johnston takes pleasure in recommending the book to telegraphers and others as a most entertaining, bright, sprightly and amusing work, either for summer or winter reading.

Those employed in offices where reading is not allowed, are cautioned that if they commence the perusal of the book in the office, they may find themselves unable to let it out of their hand until they finish it. The temptation is irresistible to "g. a." without a break until the last chapter, "O. K.," is reached.

Copies promptly mailed prepaid on receipt of price, 75 cents. Postage stamps taken. Send for a copy, now while you think of it.

A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE.

## THE AMERICAN POPULAR DICTIONARY:

CONTAINING

Every Useful Word to be found in the English Language.

WITH ITS

TRUE MEANING, DERIVATION, SPELLING AND PRONUNCIATION.

ALSO A VAST AMOUNT OF

ABSOLUTELY NECESSARY INFORMATION

UPON

SCIENCE, MYTHOLOGY, BIOGRAPHY, AMERICAN HISTORY, CONSTITUTIONS, LAWS, LAND TITLES, CITIES, COLLEGES, ARMY AND NAVY, RATE OF MORTALITY, GROWTH OF CITIES, INSOLVENT AND ASSIGNMENT LAWS, DEBTS, RATE OF INTEREST, AND OTHER USEFUL KNOWLEDGE.

BEING A

## PERFECT LIBRARY OF REFERENCE.

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the *AMERICAN POPULAR DICTIONARY* claims for it the support of telegraphers and the public, for the following among other reasons:

It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than *The American Popular*.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the *American Popular Dictionary*, and get the best Dictionary at the price published.

The *American Popular Dictionary* is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—*N. Y. Times*.

A perfect dictionary and library of reference.—*Leslie's Illus. News, N. Y.*

We have never seen its equal, either in price, finish or contents.—*Chris. Advocate*.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

*THE OPERATOR* for fifteen months and the Dictionary, only \$2.00.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00

The three books and *THE OPERATOR* one year, or any of our other \$1 books..... 2.75

The three books, *THE OPERATOR* one year and the Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with *THE OPERATOR*, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,

P. O. Box 3,332.

No. 9 Murray Street, New York.

## PRESERVE YOUR PAPERS.

Every subscriber should have a binder for his paper. We can send a handsome and durable full-cloth binder, made especially for THE OPERATOR, and with the name embossed on it in gilt letters, postage prepaid, on receipt of ONE DOLLAR. These binders have all the latest improvements. They can be used as a temporary binder, and when the volume is complete, made a permanent binder of in a few minutes. They are "just the thing," and give the best of satisfaction everywhere. Binders cannot be sent to Canada by mail, but can go by express. Mailed, postage prepaid, to any part of the United States on receipt of \$1.

## Recent Telegraphic Publications.

Any of the above promptly mailed, postage prepaid, on receipt of the price.

## THE FIRST AND ONLY TELEGRAPHIC NOVEL!

"WIRED LOVE,"  
A ROMANCE OF DOTS AND DASHES.

BY  
ELLA CHEEVER THAYER.

"The old, old story" in a new, new way.

TWO HUNDRED AND FIFTY-SIX PAGES.  
Handsomely bound in cloth. Price, 75 cents.

This brilliant little story should be read by every member of the telegraphic fraternity. Cupid "on the wire," although he meets with "breaks" and "crosses," is not dismayed, and refuses to be "switched off." The different features of an operator's daily life are ably set forth, and, aside from the novelty of the plot, the book is written in an easy, humorous style. The chapter on "The Feast," and the mishaps and adventures of Poor Quimby, will cause the heartiest laughter.

Get the book by all means, and you will wish to "G. A." without a break until the last chapter, "O. K.," is reached. Copies promptly mailed, postage prepaid, on receipt of price, 75 Cents, by Currency, Post Office Order, or Post stamps.

## American Popular Dictionary

The following order is a sample of what we are receiving every day, and shows how the American Popular Dictionary "takes," both among Telegraphers and outsiders:

"Package of nine American Popular Dictionaries received and delivered. All seem well pleased with them. Please send me by Express same as before, ten more copies of the Dictionary and one copy "Wired Love."

Yours respectfully,

Andover, O., Aug. 5th.

A. W. GATES.

Many of our readers could sell a large number of the Dictionaries if they only tried. Liberal discount to agents. Send \$1.00 for a sample copy, and see how many orders you can get.

To any one sending us \$3 for three copies, we shall send an extra copy free and postage prepaid.

# AN IMMEDIATE AND IMMENSE SUCCESS!

## Telegraphic Tales AND Telegraphic History

A POPULAR ACCOUNT OF  
THE ELECTRIC TELEGRAPH--ITS USES, EXTENT AND OUTGROWTHS.

By W. J. JOHNSTON, Editor of "The Operator."

Handsomely Printed on Tinted Paper and elegantly bound in cloth and gilt.  
254 pages. Price only \$1.

The remarkable favor with which this our latest and most popular telegraphic publication has been received, both by

TELEGRAPHERS, PRESS AND THE GENERAL READING PUBLIC,

will be seen from the following extracts, selected from a large number of complimentary letters received since the book was published.

Those given without signatures are from telegraph or telephone officials, managers, operators and others from whom we had not received (or asked) permission to use their names. Where names are given permission has been obtained.

"Neatly gotten up, tasty and full of fun."  
"After a day's toil, to pick up such a book is a pleasure and relief."  
"An excellent book, and contains many interesting reminiscences."  
"It is unquestionably one of the prettiest books of the year for the money."  
"It is very cheap, and should have a place in every telegrapher's library."  
"It is most interesting and readable, covering the entire field of electrical inventions down to the present date."  
"I consider 'Telegraphic Tales' the best of your publications, and shall take great delight in recommending it among my friends."  
"You will know my opinion of the book when I tell you that I glanced at it to see what it was like, and did not stop till I read every word in it."  
"A book that one can keep as a thing to refer to in case of a question in telegraphy coming up, and one that every telegrapher at least should have."  
"Extremely interesting. Keep on, and at some future day your adopted sign may be as well known to the public as that of any of our greatest publishers."  
"During sixteen years' connection with the telegraph nothing I have read has proved so entertaining. I shall certainly recommend it to friends and acquaintances."

"All well-posted operators know how much you have honored them as a profession heretofore, first in the publication and continuance of so fine a journal as THE OPERATOR, and afterward by publishing many splendid books. In publishing 'Tales and History' you have added another claim for our reverence, respect and hearty support. It is a most interesting work. No operator who has pride of profession in his heart can afford to be without it. The chapters detailing the scenes at the War Department on receipt of the telegram to Lincoln and Stanton, announcing the fall of Richmond, is alone worth more than the price of the book, while the history of the part that operators took in the war will be read by all with deepest interest. Let all 'toilers at the key' send for it at once."  
"Tales and History' is one of the best books I have ever read."  
"A. U., BROOKLYN, N. Y." R. FERGUSON.  
"Am very much pleased with it. Every one pronounces it a gem."  
"ASHTABULA HARBOR, O." CARL M. FOUST.  
"Instructive and entertaining, and without any doubt worth twice the money asked for it."  
"W. U., PORTLAND, ME." A. MATHEWS.  
"Externally the book is a beauty, and its contents are equally as attractive. It is a mystery how you can offer it so cheap."  
"A. U., BINGHAMTON, N. Y." C. H. NEWMAN.  
"I have found it so very interesting that I neglected

sleep to finish it. I would recommend it to every operator in the land."  
"PINCONNING, Mich." F. T. LILLOTTE.  
"I think it is a beauty outside, and the inside contains very valuable and interesting reading. Every one, whether an operator or not, should have a copy of 'Tales and History'."  
"CARLTON, Mich." CHAS. H. SUTHERLAND.  
"Tales and History' received. Am delighted with it. Besides being interesting, it is an ornament to any table. Every telegrapher should have one. Shall try and have my friends send for a copy."  
"W. U., SALEM, MASS." FRANK B. GRAY.  
"Handsomely printed and elegantly bound. It contains a great deal that is instructive to the operator, and at the same time very entertaining. It far exceeds my expectation, and merits all that is claimed for it."  
"A. U., JESSUPS, Md." C. HELMS.  
"It presents a very fine appearance, being in a neat binding, and its contents cannot fail to interest any telegrapher. The information it contains is worth twice its cost. It will ornament the shelves of any library. Every operator should have a copy."  
"B. & A. R. R., ENFIELD, MASS." E. S. LAUREE.  
Being printed from new type, purchased especially for this book, on handsome tinted paper, elaborately bound in gilt and black, "Tales and History" makes a most appropriate holiday present at a very low price.

### PRESS NOTICES OF "TALES AND HISTORY."

#### WHOLE HISTORY OF THE TELEGRAPH.

"This quite interesting volume, the work of the editor of THE OPERATOR, gives the whole history of the telegraph in a brief and intelligent manner. The topic chosen by the author is a most interesting one, and by his thorough familiarity with the subject, theoretically and practically, he has succeeded in making not only a useful but a most amusing volume."—*New York Times*.

#### COVERS THE ENTIRE FIELD.

"Judging from the cursory examination we have been able to give the above book, it promises to eclipse in interest any of Mr. Johnston's other works. The new book very thoroughly covers the entire field of telegraphic literature. The crude methods of signalling in use among the ancients; the invention, perfection and introduction of the electric telegraph; the telegraph in war; cable telegraphs, railroad telegraphy and train dispatching; weather reports; the most recent applications of electricity; the telephone; electric light; electric railways; the photophone; telegraph operators and messengers; humors of the telegraph; telegraphic 'bulls'; swindling by telegraph, are among the matters treated of. The book deserves a liberal sale both among telegraphers and outsiders."—*Journal of the Telegraph*.

#### AS UNIVERSAL IN ITS METHODS AS THE TELEGRAPH ITSELF.

"The scope and value of the pretty volume bearing this title are best indicated by a general statement of its contents. A chapter on pre-electric telegraphs is followed by an account of the invention and of its introduction into this country. Then follow a talk about operators and messengers, and a chapter on the use of the telegraph in war, in which prominence is given to the war of the rebellion. Cable telegraphs and the Atlantic cable—a valuable contribution to history—is succeeded by humorous stories and 'bulls.' Next the freaks of the lightning find place, succeeded pleasantly by an account of abuses wrought by the employment of lightning as a messenger. Weather reports, railroad telegraphy and new and curious uses of the electric fluid, with a whole chapter on 'Electricity and Life,' and another on 'Outgrowths of the Telegraph,' complete an outline survey of the work, which seems to be as universal in its method as the telegraph itself in its presence throughout the world. The author, W. J. Johnston, labored in its preparation, as he states in the graceful preface to his book, 'in the hope and belief that it will occupy an unique place among those books which instruct without being tedious and entertain wholesomely.' We think that it will, without question, especially as it has been brought out in such excellent style—in dove-colored cloth, suitably adorned in black and gold. 'Telegraphic Tales and Telegraphic History' is admirable as a gift book."—*Geyer's Stationer*.

PROPRIETORS OF

THE "OLD AND ONLY RELIABLE"

## AMERICAN FIRE-ALARM TELEGRAPH,

which has been in successful operation for more than a quarter of a century, and has been thoroughly tested and approved by

Over 110 of the Leading Cities in the United States and Canadas.

L. G. TILLOTSON, New York, President and Treasurer.

JOSEPH KINSEY, Cincinnati, First Vice-President.

B. S. CLARK, New York, Second Vice-President.

HENRY L. BRUNS, New York, Secretary.

JOHN N. GAMEWELL, New York, General Superintendent.

The GAMEWELL FIRE-ALARM TELEGRAPH COMPANY continues to contract with cities and towns for the construction of this

### Invaluable Adjunct of Every Well-Regulated Fire Department.

THIS IS THE ONLY

### PERFECT, COMPLETE AND RELIABLE SYSTEM of Fire-Alarm Telegraph in the World.

#### WHAT IS SAID OF THE GAMEWELL SYSTEM.

From a very large number of testimonials on file we select the following, as sufficiently evidencing the high estimation in which the American fire-alarm telegraph is held by those who have fully tested its practical working :

##### BOSTON.

I take great pleasure in adding my own testimony to the great value and success of the telegraph fire alarm; and I feel confident in saying that wherever once tried it will thereafter be deemed indispensable.

ALEX. H. RICE, Mayor of Boston [1856].

##### ST. LOUIS.

The superintendent of the fire-telegraph of St. Louis, in his report for 1860, says :

"A comparison of the two years' working of the department, prior to the establishment of the electric alarm, with the two subsequent ones, shows the following results : From April, 1856, to April, 1858, there were 568 alarms, of which 175, or nearly one-third, were false.

"The losses by fire during the same period show greatly in favor of the last two years. From 1856 to 1858 the amount of losses was \$1,803,315 against \$710,404 from 1858 to 1860, showing a diminution of \$1,097,911, or a sum equal to \$548,955 annually; and, on the principal that prevention is better than cure, we claim for the fire-alarm telegraph a large share of the credit in saving that amount."

##### TWENTY-ONE YEARS LATER.

The same official in his report for 1881 says:  
"In 1858, when the Electric Telegraph, as applied for fire alarm purposes, was in its infancy, the nucleus of the present system was introduced into this city. It was accepted by the authorities with considerable misgiving as to its practical utility, and it was looked upon generally as an experimental adventure, involving quite a sum of money. As time passed by, however, it gradually began asserting itself; skepticism as to its practical value faded little by little, until finally, guided by scientific research and mechanical improvements, it stands before the world to-day as being one of the most valuable achievements of man."

##### ALBANY.

In this city we would much prefer to have four steamers with the telegraph than eight steamers without it; and the same will hold good in any city. JAS. H. McQUADE, Chief Albany Fire Department.

The fire-alarm telegraph is in complete order, and has worked most satisfactorily during the year. In fact, it has never failed since its construction. It is a most valuable auxiliary to a fire department; for, in truth, without it, it would be unable to maintain the high degree of efficiency shown in our organization. Always reliable, the citizen feels assured that within a few minutes after the discovery of a fire the means will be at hand to extinguish it.—Report of Albany Fire Commissioners, 1874.

##### MONTREAL.

As the simplest illustration of its great value, we have the fires and loss for a fair average year, before and since its introduction.

Before, 85 fires.....	\$140,088 loss.
Since, 99 fires.....	35,428 loss.

A. BERTRAM, C. E. F. D. [1866].

The cost of construction will, of course, depend upon the amount of apparatus required and the extent of territory to be covered. But we have placed the prices of fire-alarm telegraph within the means of all towns, either large or small, willing to expend from \$500 upward to tell their Fire Department on the occurrence of a fire instantly and exactly where it is.

LETTERS FROM THOSE WHO HAVE USED

# DR. J. H. SCHENCK'S MEDICINES.

**From Mr. Harley P. Hopkins,  
of Providence, R. I. He is  
Cured of Consumption by  
Dr. Schenck's Medicines,  
After Being Given Up  
to Die by Some of  
the best Phy-  
sicians of  
the City.**

Dr. J. H. Schenck :

DEAR SIR: I have been cured of what three of the best physicians of this city told me was Consumption of the Lungs, by the use of your medicines. I was first attacked with the disease in October, 1880, and although I was from that time continually under the care of a physician, I grew worse and worse, until I was confined to my bed. I can hardly say that I was first attacked with the disease in 1880, for my lungs had been weak for many years previous to this, and I would quite often have severe pain in my breast if I took the least cold or exerted myself too much in any way. I grew worse, my cough became very bad; I had night sweats so severe that my bed, through the night, would be as wet as though water had been thrown over me. I was continually raising blood and large quantities of offensive matter from my lungs, and at last had all the well-known symptoms of Consumption in its last stages.

At the request of my family, my physician called in two other doctors of this city, and they, after an examination, agreed that my case was hopeless. They informed my wife that I had better be told that I could not live, as my time would be very short for arranging my worldly affairs. They also said that no medicine would be of any use to me. The next day my friend, Mr. H. I. Leith, hearing of my condition, sent me a bottle of your Pulmonic Syrup, thinking it might relieve my cough and make my expectoration easier. I began using it, never even hoping that it would cure me, but finding great relief from its use. When the first bottle was gone I sent and got more, so I continued it until I had used seven or eight bottles. All this time I was in bed and was so weak that I had to be lifted. This was not a difficult thing to do, however, as I only weighed about ninety pounds. As I have said, I commenced the use of the medicine with no thought of its curing me, but after taking the eighth bottle I would sometimes feel a little hungry, a thing I had not before done for many months. I omitted to mention that after taking four or five bottles of the Pulmonic Syrup I also began taking the Seaweed Tonic, and I also took some of the Mandrake Pills.

It is needless for me to give you an account of all my feelings during my recovery. Of course it was slow, but it was also sure. I gradually gained strength, the character of what I raised from my lungs was changed—not being so offensive—and at last I was able to get up and walk about my room. From this time my recovery was rapid. I gained flesh fast and soon went out doors, and now I am entirely well, a wonder to all my acquaintances who saw me when I was so low.

I weigh one hundred and sixty-two pounds, appetite good, and I can truly say that I never felt better in my life. I consider your medicines as wonderful in their effects. They have saved my life, and I feel so thankful to you that I am anxious that all who are suffering with lung troubles should know how good they are. Of course I can give a better account of my case in telling of it than in writing, and if any who read this are interested, they are welcome to call on me at my residence.

Yours truly,

HARLEY P. HOPKINS,  
No. 2 Howell street, Providence, R. I.  
May 19, 1881.

Mr. Harley P. Hopkins, who writes the foregoing letter to Dr. Schenck, of Philadelphia, is an old resident of Providence. I have known him well for the last fifteen years, and I can assure the public that all he has written in regard to his sickness and recovery is strictly true. He was considered a consumptive, in the last stages of the disease, by his physician and friends, and I believe that his recovery is entirely due to the use of Dr. Schenck's medicines.

H. I. LEITH, Druggist,  
No. 282 N. Main St., Providence, R. I.  
May 19, 1881.

**From an Old Resident of Albany,  
New York.**

WHITE LINE CENTRAL TRANSIT CO.,  
George C. Redden, Agent.  
N. Y. Central Freight Depot,  
Corner Orange and Water Sts.,  
ALBANY, Feb. 16, 1881.

Dr. J. H. Schenck, Philadelphia, Pa.:

DEAR SIR: I write this to let you know that my little daughter Henrietta, whom you saw on your visit to this city in the fall of 1879, has entirely recovered her health by the use of your medicines. I wish also at the same time to give you some facts in regard to her case which I did not have time to do when you were here. My daughter was considered a healthy child until the month of November, 1878, when she was attacked with Remittent Fever, with which she was sick for a long time. As she was recovering from it she took a heavy cold, which settled on her lungs, producing a constant hacking cough. As several of her mother's relatives had died of Consumption, we were much troubled in regard to her case, especially as our physician told us that her lungs were weak, and after her cough had continued some time, that they were seriously affected. He prescribed many things for her, principally cod-liver oil and stimulants; but she kept getting worse and worse, until at last he told us that there was no hope for her recovery; and to satisfy us that he had done all that was possible for him to do, called in two other doctors. They, after consultation, agreed that she must die, and that all we could do was to make her comfortable while she lived. This was in the month of September, 1879. Although we were assured by our physician that our little daughter could not get well, yet we were always looking over the papers to try to find something that would at least preserve her life for a time. One evening I read in the *Albany Evening Times* the statements of many who had been cured of serious lung diseases by your medicines, and feeling that they at least could do her no harm, I concluded to give them a trial. I therefore went to the drug store of Mr. Miller, a gentleman with whom I was well acquainted, and asked him what he knew or thought of your medicines. He said: "I have heard them highly spoken of by my customers, and believe them to be good." I then bought a bottle of the Pulmonic Syrup, as well as some of the Mandrake Pills and Seaweed Tonic, and my daughter commenced to use them according to the printed directions. We all soon saw that they were doing her good. When she had taken them about two weeks, we noticed by the paper that you were to visit Albany professionally, and, taking advantage of this opportunity, we had you see her. Although you did not see her at the worst, you of course remember her apparently hopeless condition. We can only say that from the medicines you gave her she soon rapidly improved, and became healthy and strong. We give you this certificate or letter, that others may know of your great medicines. I am satisfied that you saved the life of my child, as she was pronounced beyond medical aid by three of the best physicians of this city.

Respectfully yours,  
GEORGE C. REDDEN.

**Cured of Consumption after Two  
Years of Severe Illness!**

NEWBURGH, N. Y., March 4, 1879.

Dr. J. H. Schenck:

DEAR SIR: I feel that I am doing good to others by telling you what your medicines have done for me. I was sick with Consumption for over two years, and after trying many remedies and employing the best physicians in this city, without benefit, I was induced to use your medicines. I had hardly taken the first bottle before I felt much better, and after continuing their use for some time was entirely cured. This was over six years ago, and as I have continued to enjoy good health since, I feel that my cure is permanent. I am happy to add my testimony with many others to the efficacy of your medicines. I know many others in Newburgh who have been benefited by their use.

MRS. SOPHIA M. LAWSON,  
No. 59 Ann street, Newburgh, N. Y.

**From Springfield, Ohio.**

SPRINGFIELD, O., Jan. 29, 1880.

Dr. J. H. Schenck:

DEAR SIR: From a feeling of gratitude and a desire to benefit others, I send you this certificate that all may know of the virtues of your remedies. For over one year my case seemed hopeless; I had night-sweats, loss of appetite, a very severe cough, and a complete prostration of my whole system. My physician pronounced my disease Consumption. I was reduced almost to a skeleton, and all the medicines I took failed to give me any relief. I had fully made up my mind that I was incurable when an acquaintance recommended your remedies. I had little faith in them, however, having lost all hope; but in a very short time after commencing their use, I found to my great surprise that I was getting stronger and that my worst symptoms were fast disappearing. I persevered in taking them until I was restored to perfect health. I assure you that language fails to express the gratitude I feel toward you for your skill in preparing so good and great a remedy.

Gratefully yours,

CATHERINE A. STEWART.

**Consumption Cured—From Hop-  
kinton, Mass.**

Dr. Schenck:

DEAR SIR: Last fall I caught a severe cold, which, through neglect, gradually settled in my throat and lungs, causing, as I was told by the doctor who attended me, Ulceration of the Lungs. He, however, said he could cure me, and I was under his care for some time, but I continued to grow worse. At last he told me that my lungs were so bad that he did not think I would ever get well. At this time I was having severe hemorrhages very often, on several occasions raising as much as a cupful of blood at a time. My cough was constant, my nights sleepless, and I had such severe night-sweats that it seemed in the morning as if some one had thrown water over my bed. I was so low that I was not expected to live more than a few days, and it was once reported in the neighborhood that I was dead. When so sick, my father was persuaded by a druggist of this place to give me your medicines. Although he could not believe that they or anything else would cure me, he, as a last resort, concluded to buy a bottle each of the *Pulmonic Syrup* and *Seaweed Tonic*. I used these up according to the directions, and we thought there was a slight improvement in my worst symptoms; so we concluded to continue their use. I used a bottle of the *Syrup* every four days until I used three bottles; then my appetite began to come back and I felt a little stronger. Soon after this my cough left me, and I had no more hemorrhages, and my night-sweats stopped. I am now well, and I write you this to show what a wonderful cure your medicines have made in my case. Any one is welcome to call on or write to me, if they doubt the genuineness of this letter, and I can refer to hundreds who know me in this place and who knew of my severe illness.

Yours truly,

WILLIAM JOHNSON,  
34 Wood street.  
HOPKINTON, MASS., June 9, 1881.

I am the mother of Mr. Wm. Johnson, who writes the above letter to Dr. Schenck. I nursed him through his sickness, and I wish to say that all he has written is true. In fact he could not write it worse than it was. He was in the last stages of Consumption, having all the symptoms—feet swelling, cough, hemorrhages, and night-sweats.

MRS. OLIVER JOHNSON.

**From Henry Morgan, Esq., of  
Springfield, Mass.**

Dr. J. H. Schenck:

DEAR SIR: In the winter of 1862, having been in delicate health from weakness of the lungs for over two years, I took a heavy cold, which settled on my lungs and completely prostrated me. I had a very bad cough, which kept me awake nights and racked me so that I gradually wasted away until I did not weigh more than two-thirds

my usual weight. I was at that time living at Chicopee, Mass., and I consulted the best physicians in that place, but they only gave me temporary relief. It was the opinion of all that I was fast going into Consumption, and I was advised by my friends to consult a prominent doctor of Boston. I did so, but his remedies did not benefit me any, although I took them for a long time. I was very much discouraged, and thought there was no hope for my recovery. About this time I happened to read your advertisement, and among those who testified to the benefit they had received from your medicines I noticed the name of the Rev. Henry Morgan, of Boston. Being personally acquainted with him, although no relation, I concluded to write to him, as I had some doubt about the genuineness of the letter. He answered my letter, saying that it was all true, advising me to at least give your medicines a trial, and he believed they would cure me if I was not too far gone.

I at once began using the *Mandrake Pills*, *Seaweed Tonic* and *Pulmonic Syrup*, as directed by you on the printed wrappers, and I soon saw a marked improvement in all my symptoms; my cough began to get better, my appetite improved, the soreness left my lungs, and I could see that I was gradually getting stronger every day. I continued with the medicines faithfully until I was entirely well, and although my business is one that is considered injurious to the lungs (brass-finisher), I have enjoyed good health ever since.

I thoroughly believe in the curative properties of your remedies, not only from my own experience with them, but from the cures I have heard of their performing among my acquaintances, some of whom were very much worse than I was. You are at liberty to refer to me, and I will cheerfully answer letters from those who are similarly afflicted. Yours truly,

HENRY MORGAN,  
No. 200 Carew St., Springfield, Mass.

The originals of the foregoing letters, as well as many thousand others, which lack of space in this paper prevents our publishing, can be seen by any one at the office of Dr. J. H. Schenck & Son in Philadelphia.

We ask the afflicted to go and see the people who write these letters. If this is impossible, write to them, inclosing a stamp for return postage.

For other Certificates of Cures send for Dr. Schenck's Book on Consumption, Liver Complaint and Dyspepsia. It gives a full description of these diseases in their various forms; also, valuable information in regard to the diet and clothing of the sick; how and when exercise should be taken, &c. This book is the result of many years of experience in the treatment of Lung Diseases, and should be read, not only by the afflicted, but by those who, from hereditary taint or other cause, suppose themselves liable to any affection of the throat or lungs.

## HOLCOMB'S NEW AMPLIFYING TELEPHONES

FOR PRIVATE LINES.  
PATENTED IN THE U. S. APRIL 26, 1881. PATENTED IN CANADA, JULY, 1881.

The Only Reliable Substitute for the Costly Electric and Magnetic Telephones.

NO ROYALTY! NO EXORBITANT RENTAL FEE!

SOLD OUTRIGHT AT MODERATE PRICES.

They transmit Conversation, Music, Signals, Commercial Orders or any audible sound with almost electric speed and surprising fidelity. The tones are clear, natural and distinct; every word is easily understood.

These instruments work well in all kinds of weather, and may be relied upon for effective service at all times. They are complete in themselves, and are perfect and durable in every part. They are unquestionably the best instruments of their class. We warrant them to work better on all lines within their compass than any other (non-electric) telephone. Elegantly finished. Warranted to work two miles; Reliable and efficient. Price, \$10 per set net. WIRE.—With these new Telephones we use Galvanized Steel Cable Wire of great strength and conductivity. It does not stretch or break, and makes a very permanent line. PRICES.—Double wire for short lines, 3 cents per rod, by express; treble wire for long lines, 5 cents per rod, by express. Metal Insulators, 5 cents each.

**\$4.00 Telephones.**—We also furnish the Improved Automatic (Patented) Telephones for short lines. They work excellently, and are certainly the best telephones for the price now made. Price per set, \$4.00 net. Galvanic Wire for these Telephones, 3 cents per rod, by express. Insulators, 3 cents each.

Illustrated descriptive circulars, testimonials, etc., sent free on application. Correspondence solicited. Terms, cash with order. Address all orders to the Patentees and Proprietors,

### The Sheffield Telegraph Hand Car.

We take pleasure in presenting to our readers in this issue a sketch of a novelty in the way of a hand car which is giving excellent satisfaction wherever introduced.

It is very light, being much less than half the weight of an ordinary hand car and so constructed that nearly every pound of force expended in propulsion is utilized for motion, the friction and loss of power so noticeable in the common car being reduced to the minimum.

The materials are mainly ash and the very best quality of wrought and cast iron, combined in such a way as to secure the utmost lightness and strength, with every part fully braced. The wheels are so made as to avoid very largely the flange friction so destructive of power on ordinary styles of cars. Power is applied by an upright lever worked by two men who sit facing each other, the feet of both also engaging mechanism which aids in propulsion.

The strength of this machine is adequate to the power applied and to the usage it is likely to receive, while at the same time it is so light as to be easily lifted from the track when occasion requires. And although it is made to accommodate two men, it may be easily operated by one person, or it can be readily run by two men, who may carry the third man in place of the tools and if necessary a fourth man on the rear seat.

The value of this invention will be appreciated by those whose duty requires them to pass frequently over railway tracks, and who have heretofore used only the cumbersome and power-wasting hand car. It is invaluable to telegraph-line men, track repairers, bridge builders and inspectors, and, in fact, to any class of men having to do with railways and telegraph lines. It is also well adapted to light section work, and has been adopted by several roads for this purpose, and so far with excellent success.

This car is having a very large sale, the firm finding it difficult to fill their orders. As an evidence of the manner in which they have been received by railroads, it is stated that a sample one was sent to New Zealand about a year ago, from which an order for twenty has recently resulted.

Any further information may be obtained from Messrs. Geo. S. Sheffield & Co., sole manufacturers, Three Rivers, Mich.

nal Office, United States Patent Office, Smithsonian Institute, Washington.

and Fire and Burglar Alarms; Pond Indicator Co., New York, Electric Indicator; Western Electric Manufacturing Co., Chicago, Telephone Exchange; Weston Electric Light Co., Newark, N. J., Electric Lamps and Dynamo Machines. Bronze Medals.—Clinton M. Ball, Troy, N. Y.,

THE SHEFFIELD TELEGRAPH HAND CAR.

### The Closing Days of the Paris Exhibition.

[From the Special Correspondent of The Operator.]

The result of the juries' labors was announced at a meeting of exhibitors and others connected with the exhibition, held in the Conservatory of Music, on Friday, Oct. 21. The following is a list of the recompenses awarded to America:

Diplomas of Honor for Ministries, Administrations and Scientific Societies, United States Sig-

ted States Electric Lighting Company, Maxim's System.

Silver Medals.—Bailey & Puskas, Railroad Signals; Dr. W. G. A. Bonwill, Philadelphia, Electric Mallet for dental purposes; Connolly Bros. & Tighe, Washington, Automatic Telephone Exchange; A. E. Dolbear, Telephone; Sergt. A. Eacard, U. S. Signal Service, Meteorological Recording Instruments; Electro-Dynamic Co., Philadelphia, Electric Motor; Electric Purifier Co., New York, Electric Middlings Purifier; Charles W. Hubbard, Boston, Electric Hotel Indicator; Wm. J. Philips, Philadelphia, Printing Telegraph

Electric Lamps; Victor Chavet, Paris, Carbon for Electric Lamps and Batteries, American manufacture; George Cumming, New York, Periphery-Contact Telegraph Key; Chas. Dion, Montreal, manufacture of Copper Spirals for winding magnets; Hoosac Tunnel Tri-nitro-glycerine Works, North Adams, Mass., Fusees and Insulated Wire; August Partz, Philadelphia, Battery; Photo-Relievo Company, New York, Photographs in relief and bas-relief obtained by the action of light and electricity; White House Mills, Hoosac, N. Y., Dynamo Machines; Charles Williams, Jr., Boston, Telephonic Apparatus.

Thus America receives five diplomas of honor, three gold, twelve silver and nine bronze medals, which, when we take into consideration the fact that our exhibit is a small one, is a very creditable showing. England receives ten diplomas, eight gold, thirteen silver and fifteen bronze medals, and France gets twenty-five diplomas, forty-one gold, seventy-nine silver and one hundred and fifty-eight bronze medals, out of a total of one hundred and twenty-one diplomas, seventy-eight gold, one hundred and fifty-two silver and two hundred and sixty-two bronze medals awarded. The French exhibit comprises rather more than one half of the entire exhibit, but, as I mentioned in a former letter, a great deal of it is mere electrical clap-trap. It may be an ungrateful thing to say, but it is the general impression among the foreigners that the medals have been distributed too profusely among the French exhibitors. No exhibitor was awarded more than one diploma or one medal, but Edison was recommended for a diploma by three different juries. The report telegraphed to America that he had received five gold medals was erroneous, although he received the highest award in the power of the jury. The Brush light took a gold medal also, but was exhibited in the British section, so that America does not receive the credit for it.

At last, after many delays, and after the juries have made their examinations, the great Edison engine has been got ready and commenced to work. It is said to be capable of lighting 1,200 lamps, but at the present writing not more than 500 have been put in circuit at any one time. It was originally intended to light the grand staircase with this system, and during the delay in getting the lamps and engines placed the lighting of the staircase has been done by arc lights. The work of installing the Edison lamps is now being pushed vigorously. The effect, so far, is very fine, but it seems to be almost a needless waste of work, as the exhibition closes in another fortnight.

Mr. Marcel Deprez's system for the division and transmission of power is also late in being placed. Enough of it is working, however, to show that he has accomplished some very wonderful things. He has now in circuit twenty motors running small machines, from a sewing machine up to a printing press; and, on the same circuit, fed from the same generator, are two arc lights. The power for all this work is derived from a four-horse power gas engine, driving a small Gramme machine. Mr. Deprez has proven himself to be one of the foremost inventors and electricians of the day. The principal objects shown by the Ministry of War for measuring the velocities of projectiles, and by the different railroad companies in the shape of railroad signals and speed indicators, are among his inventions. He has been awarded a diploma of honor, and his was the only case in which a diploma was awarded by a unanimous vote of the jury.

The lighting of the opera-house by electricity has not been the brilliant success that was predicted. The arc lights did well enough, but the incandescents were so poor that the gas was lighted to help them out. The Maxim light gave the most satisfactory result of this class and has been promised another trial soon, but the fate of the Swan and Edison lamps may not be so favorable.

The Prince of Wales has visited us twice this week, the last time in the afternoon, when he was shown around the different sections by the British Commissioners. He manifested quite an interest in the objects exposed and particularly in the various multiple telegraphs. Professor Bell, happening to be in the building at the time, was presented to His Royal Highness and had quite a long chat with him. The party were afterward conducted to Edison's rooms, and among other things were shown the phonograph. Mr. James Hipple, who "causes to function" this instrument, regaled the Prince with "Yankee Doodle," some plantation songs, laughing, crowing and coughing, which amused the guest very much. This Mr. Hipple has had the honor, so unusual for Americans, of singing several times for royalty—in the phonograph. He entertained King Kalakaua one evening with "There was an old nigger, and his name was Uncle Ned."

The Crystal Palace Electrical Exhibition is

advertised to open about Dec. 24, and is beginning to attract considerable attention. Many of our exhibitors here have already secured space, among whom are Messrs. Connolly Bros., Dolbear, Bell, Edison, Maxim, Weston, the Electro-Dynamic Co., the White House Mills and others. Some of the American Commissioners have already sailed for home, and a number of the exhibitors intend leaving just as soon after the 15th as they can. Everywhere there are signs of the approaching dissolution of the exhibition, and to those of us who have spent three months here these signs are very welcome. The novelty has worn off, and those who expect to go home next month are longing for the sailing day to arrive. The closing is officially announced to take place on Nov. 15.

### The Telephone Switch-Board.

Nothing is more important to the telephone exchange manager than the switch-board. It is, as it were, the central sun around which all his other apparatus revolves—the medium through which his respective instrumentalities gain an operating hold upon the lines radiating from the central office, and thereby to the subscribers' offices located thereon.

Culley, one of the old masters on electrical literature, particularly that class of electrical literature relating to the transmission of intelligence from one point to another, defines a switch-board in the following terms:

#### SWITCHES OR COMMUTATORS.

"These are employed for connecting one circuit to another, for dividing a circuit, or for any purpose where connections have to be altered more frequently than it would be convenient to do at the test box."

Pope, an equally good American authority, uses almost the same words, viz: "These are employed for the purpose of connecting one circuit with another, for dividing a circuit into two parts, or, in short, for any purpose where it is necessary to alter the connections of a line or circuit."

Prescott says the object of a switch is to "facilitate the making of the necessary changes in the connections of the wires," and "for interchanging the wires among themselves."

This last definition gives the key to the name, "commutator," generally given in European countries to this piece of apparatus. The word "commutator" may be explained literally by the word "interchanger."

The switch-board, as generally used by telegraph offices in this country, has never found much favor in England, its place being filled to a measurable extent by the testing board, a plain board on which binding screws are symmetrically arranged, to which the several wires are led, and which are then connected as may be found desirable by short wires.

The above-mentioned fact may account for the absence of switch-board patents taken out by English inventors.

It is a fact that the published abstracts of English electrical patents, from the earliest ages of antiquity to the year of 1868, A. D., disclose no patent for the switch-board; consequently that class of inventors who make these abstracts the basis of their productions have had to go it alone, if we may so speak. Moreover, extremely little was done in this line of invention, or rather patented invention, even on this side of the Atlantic, until 1867, when Brownson, of Wells-ville, Ohio, patented a switch-board whose front was so covered with little brass studs and buttons as to remind one of a French accordeon, while its rear was such an inextricable network of wires as to compare favorably with the celebrated labyrinth of Crete. The writer, in the days of his ardent youth, ordered one of the first of these switches, and well remembers the unspeakable awe with which he was wont to contemplate its mystic glories. This, however, though one of the first patented, was by no means the first invented. The first switch-board of which we have personal knowledge, was that devised by that veteran of the Telegraph, J. Murray Fairchild, of New Haven. It consisted of a series of dials, arranged each with metallic studs round its periphery, connect-

ing with the several lines and provided with a button pivoted at the centre of the dial and capable of being placed upon any one of the studs, thus changing the course of the line which was permanently attached to the button. This switch-board was invented by Mr. Fairchild away back in the fifties, and until quite recently held a place in the Western Union offices of New Haven, Bridgeport, Stamford and South Norwalk. For its time, it was a really ingenious and useful piece of mechanism, as is unwillingly attested by several subsequent inventors, who, without knowing anything of the Fairchild board, have independently invented or devised the same thing. No switch-board has had the honor of such frequent invention as this. Mr. Fairchild did not patent it.

The Culkan switch was a Pittsburgh idea and came out in 1868. In it the line wires were led to upright metallic strips ranged on the face of the board, and attached to them by screw posts at the top. Cross wires run on the reverse side of the board, in connection with binding screws on the edge, to which the instrument wires were led, and with pivoted buttons arranged between the strips and capable of being turned on to the strip on either side. This had a fairly long and useful life, and is even now used considerably in Western Pennsylvania and New York. Those who desire to know more of this board will find it fully described in "Pope's Modern Practice of the Electric Telegraph."

This switch, though fairly satisfactory, yet had some disadvantages. The pivots would work loose and invisible troubles would arise, and the circuit manager would need a good "eye-glass in his ocular" to discover their source. Its general employment, too, was but evanescent. It was in due course succeeded by the Western Union pin switch, which is now known, we may almost say, the wide world over. It is, indeed, so widely and well known that a description seems superfluous.

None of these switches were ever patented, although more worthy of that honor than many of the nondescript appliances lately given to a confiding public, and protected, for no earthly reason, by the mystic formula, "My invention relates to electric switch-boards, etc." All the switches heretofore mentioned were designed for telegraph service, and the inventors of the same appeared to recognize the fact that they were all mere modifications of one wide principle—namely, that of two sets of conducting strips, arranged upon a frame at right angles with one another, and some means to connect any one of one series with any one of the other series.

This principle is known as that of the Swiss Commutator or Universal Switch. It is very old, and has been liberally used on the continent of Europe. Like *Topsy*, "it never was born; it grew."

One other of the old switch-boards deserves notice; namely, the Jones lock switch. Its distinctive feature was that two sets of metallic plates were arranged transversely with regard to each other, holes bored at each crossing point, and a slot cut in the hole of the upper plate. The connection was made by a plug or pin, provided at its lower end with a spiral spring, and higher up with a pin fitting loosely in the slot of the hole.

To insert the plug, it was turned so that the pin slid in the hole, and as soon as it had passed the upper plate, it would be turned round. The pin, no longer coinciding with the slot, would, of course, hinder the plug from coming out. In later years this board was used as a telephone switch.

When the central office telephone business was introduced, it was largely manipulated by men who, though possessing marked ability, yet had no previous knowledge of telegraphy or experience in electrical communication; and, in fact, this lack of experience was emphasized by a supreme contempt for the professional ability of telegraphic electricians.

The cry was: "Gentlemen, the telephone is a new thing, an instrument of surprises, and you must unlearn all you know before you can successfully handle it." In some things this was partly true, but our telephone friends made the mistake of jumping at a conclusion from incomplete premises, and to-day, when the telephone exchange is one of the institutions of the land, none have achieved greater success, or have attained a more abiding prominence, than those

who first graduated as telegraphic electricians. Holding the views enunciated above, it might have been expected that the labors of the condemned class would also be ignored, and such was the case. Instead of improving the switch-boards and other electrical appliances ready to their hands, new ones must of necessity be invented, and the new inventions protected by patents.

Hence the tremendous influx of switch-board and other patents. A careful examination of late switch-board patents will, however, show that very few really new ideas are exhibited by any of these so-called inventions, the majority of them being for some new and alleged improved form of connector between the vertical and horizontal-conducting strips. Occasionally—as in the device of Mr. Ellsworth, who shows a method of readily ascertaining which connecting strip is already in use—we find a new object gained, but not often.

To make a good telephone exchange switch-board, however, out of an ordinary telegraph switch, we concede that considerable remodelling is necessary; and after the first heat of invention was over, practical men began to look about them, to see the disadvantages they were laboring under and endeavor to overcome them. It was seen that time and money were, in telephone offices, the two main articles to be economized. Time, because speed of connection is the very life-blood of the business. Money, because in many of the exchanges the telephone business was managed and owned by men of little or no capital; and, in others, the expense, in any case, would be great, and economy was necessary to make anything at all out of the business.

Soon, therefore, it became obvious that the telephone switch must be compact; all the apparatus must be easily and quickly under control; everything about it must be well made and well put together; the motions required in a connection must be reduced to a minimum, and yet the apparatus must be cheap.

The cry of cheapness for a long time obscured the vision of the practical man, and many switch-boards unworthy of the name were sent over the country; but a healthy reaction has taken place, and the general character of the telephone switch is much improved.

It was early discovered that an escape or a ground through a telephone did not have the ruinous effect upon telephone lines that it has always had upon a Morse telegraph line, and this fact was utilized by the construction of appliances for listening at the central office, and thus supervising a connection which, instead of looping the listening telephone completely into the line circuit, merely connected it by a third leg to the ground; or, technically speaking, to the two lines connected for conversation.

This practice was generally cheap, both in first cost and results, and does not rank as a success, especially where a long line is connected to a short one. It is found in practice that the listening telephone takes way much of the electricity. The best manufacturers now arrange to have the try-telephone looped in.

The telephone switch-board, as at present made and sold, comprises the following features: Annunciators to receive calls, battery keys or magneto-generator to answer calls and to signal subscribers when wanted, appliances for connecting any two circuits for intercommunication, appliances for supervising connections and listening off, and frequently an annunciator between two circuits when connected, to allow the subscriber, if he pleases, to ring off. Vain hope!

It is not to be expected that in an article of this general character, any special telephone switch will be described; that pleasure the writer reserves for special articles. But to those who are going to buy, one word. Get a board by which the necessary functions are performed first, well; secondly, quickly, and you will in the end be better satisfied, even if you have to pay well for it, than if you paid a nominal price and bought a patent scarecrow.

T. D. LOCKWOOD.

A clerk in a Cincinnati store, in attempting to remove some goods from a show window by means of a brass rod, recently, accidentally touched an electric light wire and received a shock that threw him headlong through the plate glass to the pavement. His face was badly cut, but he was not permanently injured.

### Review of the Past Two Weeks.

The past fortnight has been very quiet, telegraphically. Nothing further has been heard from the Mutual Union's charges of bribery, and that company still retains the one hundred dollar bill and the three fifty-dollar bills, which they claimed had been used to bribe one of their clerks.

Perhaps the most important event of the fortnight was the gathering of telegraphers on Sunday last, in the United States Hotel, this city. The occasion was a general meeting of the organization heretofore known as the Telegraphers' Mutual Union. Mr. E. T. Howell acted as chairman of the meeting. Considerable discussion took place as to whether alien members from other associations of the fraternity could come into the Mutual Union without the payment of dues and on the strength of this connection, resulting in an appeal to the constitution of the organization, which effectually settled the question by forbidding any coalition except by those having offices and employment in the district, which is bounded by Albany on the west. It was stated that confusion had arisen, and was likely at any time to arise, confounding the society, on account of its name, with the Mutual Union Telegraph Company. The name of the organization, therefore, was changed to the "Telegraphers' Union." It was agreed, for the protection of members, that no member of the association shall, during the next five years, instruct any outsider in the mysteries of the profession. It was also proposed to take action looking to the protection of the profession, as regards the cutting down of salaries, the desired remedies to be sought without the intervention of "striking" or refusing to comply with rules, which is a line of action distinctly opposed to the genius of the Union, the constitution of which distinctly reprobates "strikes."

The operators at Washington, D. C., also held a meeting on the 6th inst., at which they talked over their grievances. Chief among them is the employment of employes, telegraph operators from the signal office and other government bureaus to do extra work. They claim that, having borne the burden and heat of the day last summer, they are entitled to consideration when extra work, at extra pay, is to be done.

Gen. Hazen instituted an investigation in regard to this subject last week, the only result apparent from which was the return of the Signal Service men to the Western Union office to continue their depredations on the pockets of the regular force. These "extra" men are not only a disadvantage to the regular force, but also to the fraternity at large, as their withdrawal would create six first-class vacancies in the Washington office.

Another grievance is the non-allowance of extra compensation for Sunday work. The meeting was preliminary to another, out of which will probably come a proposal to enter the National Association of Telegraph Operators, with a view to the righting of their wrongs.

The Mutual Union Company opened formally for business yesterday, although it is not soliciting custom at present. The main office in this city has been stationed temporarily at No. 45 William street, and 15 branch offices have been opened at various points in the city. The lines now approaching completion will reach Albany, Buffalo, Cleveland, Cincinnati, Chicago, Milwaukee, St. Paul and Minneapolis, and all intermediate points on the lines of the New York Central, Lake Shore, and Milwaukee & St. Paul railroads; Glen's Falls, Rutland and St. Albans, in Vermont, and Canadian points to Montreal; Tonawanda, Niagara Falls, Hamilton and Toronto, Ontario; Portland, Bangor and Augusta, Me.; all points on the Chicago & Alton Railroad between Chicago and St. Louis and between St. Louis and Kansas City; also all points South and West touched by the Baltimore & Ohio Railroad system. The company has made a contract with the Lehigh Valley Railroad for the use of its telegraph system, and with the Brooklyn bridge trustees for a cable of ten wires upon the bridge. The company pays better salaries to operators and leases private wires at 33 per cent. less than the Western Union, and will begin to take general messages at ten per cent. less than that company, although there is some doubt as to the wisdom of the latter course.

The New York Produce Exchange has granted leave to the Baltimore & Ohio Railroad Com-

pany to furnish to the Exchange telegraphic facilities to the West. As the Mutual Union Telegraph Company has a contract to perform the work of the Baltimore & Ohio Company, it is thought that it is actual mover in the matter. The Produce Exchange, it will be remembered, has recently complained bitterly of the service of the Western Union Company.

The "Central Construction Company"—Jay Gould's double in the bogus American Union Company—has taken strange action lately. The Central Construction was organized to build the lines of the American Union Telegraph Company. When it had completed that work and the American Union wires had passed into the possession of the Western Union Telegraph Company it was supposed that there was no reason for the longer existence of the Central Construction Company. A petition for its dissolution was, therefore, in July last presented to the Supreme Court, and a referee was appointed to inquire into the matter. Since then some reason has arisen for the continuance of the corporation in existence, and Messrs. A. H. Calef, Giovanni Purissimo Morosini, W. E. Connor and Joseph Owen, a majority of its directors, petitioned for leave to withdraw the petition for dissolution, but without stating what impelled them to take this course. Judge Barrett, in Supreme Court Chambers, on the 5th inst., made an order discharging the referee and discontinuing the proceedings for dissolution.

The underground system has been submitted to a most successful test, a report of which will be found in another column.

The idea of electric railways has also received a boom by a visit to this city from Dr. Siemens, who constructed the electric railway in Berlin. He became intimate with Messrs. Jay Gould, Russell Sage and Cyrus W. Field soon after his arrival in this country, and is reported to have interested them in the idea of adopting the electrical motor upon the elevated railways here. A few days ago, in company with the three gentlemen named and General Manager Hain, he made a trip of inspection over the different lines. Mr. Russell Sage says that it is possible—he declines to say that it is probable—that the result of that conference would bring about a complete revolution in elevated railroad management, so far as relates to a propelling force.

Chestnut street, Philadelphia, from the Delaware to the Schuylkill rivers,  $2\frac{1}{2}$  miles, will soon be ablaze with the electric light.

At the fire at Woodstock, N. B. last Thursday night, both the telegraph offices were destroyed.

Western Union stock is quoted at 86 $\frac{3}{8}$ . Last issue it was 87 $\frac{1}{4}$ .

### A Model Office.

The Western Union main office at Tenth and Chestnut streets, Philadelphia, built entirely of gray granite and iron, thoroughly fireproof and elegantly frescoed, is probably the finest telegraph office on the continent. It is three stories in height, and surmounted by an immense mansard roof and with a "New York basement" and sub-cellar forms a spacious edifice.

The upper floor, or mansard roof, one large room on the third floor, and the basement and sub-cellar, leased by the Western Union Company, are fitted up most elaborately, no expense being spared in rendering everything as perfect and convenient to the employes as possible. In the sub-cellar are the batteries, which have been systematically arranged for the greatest convenience and efficiency. The steam engine for furnishing power to the net-work of pneumatic tubes is also stationed in the cellar.

The Receiving Department is situated in the basement, and fitted up in a style which is rarely seen outside of the Capitol at Washington. The Delivery Department is also on the same floor.

On the third floor is the office of Mr. John E. Zeublin, the Superintendent, and one of the most efficient and popular executive officers in the service. His district comprises the entire States of New Jersey, Delaware and Maryland, the District of Columbia and the State of Pennsylvania east of the Allegheny Mountains, including Bedford and Altoona. The efficiency of the service in this great district is sufficient testimony to the executive ability of Mr. Zeublin.

On the fourth floor, reached by two elevators and easy flights of marble steps, is situated the operating room, coat room and clerk's room. The operating room is a chamber seventy-five

by sixty feet, with a ceiling fifteen feet in height beautifully frescoed in light blue and gold. The original floor—marble tiles—has been overlaid with a flooring composed of alternate strips of walnut and ash two inches in width. There are fancy wood tables for 106 instruments, exclusive of the tables occupied by quads., duplexes and repeaters, arranged in compartments of four, six and eight, with French plate glass partitions.

The switch-board, which is of the new Western Union pattern, consists of four sections, each section capable of accommodating fifty wires. Even with this capacity it is so crowded at present that it has been found necessary to run all the city wires direct to the instruments, without passing through the switch-board. Arrangements are now, however, in progress to add two more sections to it, thus giving it a capacity of 300 wires.

In the office there are four quadruplex circuits working between Philadelphia and New York, in addition to the motor-printer, and including one from the Philadelphia Stock Exchange to the New York Stock Exchange. A sixth quadruplex circuit is formed by the "C. N. D. quad." to Baltimore, and all of them are kept constantly manned. The duplex circuits in the main office are: Chicago, Cincinnati, Pittsburgh, Baltimore, Washington, Boston, Harrisburg, Atlantic City and Cape May; at "C. U." (Third and Chestnut) there is a duplex to the New York main office, and there are two duplex circuits from brokers' offices on Third street to the New York Stock Exchange—twelve duplex circuits in all. In addition to these, eight branch offices work direct to branch offices in New York, independently of the main office in either city, beside separate wires to the New York main office.

There are 88 first-class working wires, which, if necessary, could be increased to 120, between New York and Philadelphia, owned by the Western Union, exclusive of "way" and railroad wires. They also own and operate 53 first-class wires between Philadelphia and Washington.

The business is enormous, the average number of messages exchanged between Philadelphia and New York being 3,500 daily. This estimate does not include the business of the branch offices, which amounts to from 1,000 to 1,500 more each way per day. It is safe to assert that the two cities named are the two busiest, telegraphically, in the world.

The operating force consists of 145 operators—105 day and 40 night—including the city line, among whom are about 25 lady operators.

Since the late consolidation the entire working force has been remodeled, and the *personnel* of the office has been improved. Inferior operators at low salaries have been replaced by more able men, generally at higher salaries, while 35 more men are employed on the force—an increase of help which has been needed for two or three years back. Indeed, Philadelphia has not only to answer her own demands for prompt service in cases of emergency, but, being centrally located between New York, Baltimore, Washington and the West, it has to supply frequent demands from other towns where there is an unusual rush of business, and there is scarcely a day passes when it has not to respond to some such demand from an adjacent town. Sometimes the sudden and urgent demand is for eight or ten men at once, and even for more, as was the case at Long Branch and Washington during the late President's illness.

The following changes, in the nature of reform, have been made during the past summer: Mr. William G. Jones, manager, vice Mr. Heber C. Robinson. Mr. John D. Clarke, late chief operator of the American Union, to be chief operator in the place of Mr. George W. Porter, promoted to be chief clerk in the superintendent's office, Mr. Porter having general supervision of the accounts in the district offices. Mr. William H. Dillon, late of the American Union, to be assistant chief operator, with general supervision of the wires and business of the office. Chief Joseph T. Wilde retains his old position, looking after the wires north and east. Mr. Charles H. McConnell, late of the Western Union office, Pittsburgh, to be assistant chief operator, with supervision over the wires south and west. Mr. Charles Jamison to be cashier, vice Mr. William Carley, resigned. Mr. S. S. Garwood to be manager at "C. U." (Third and Chestnut), vice Mr. Frank W. Griffin, who will remain in the

same office to look after the American Union wires and business—this office and the American Union main office having been combined to facilitate business. In these duties Mr. Griffin is ably assisted by Mr. D. J. McLoraine. The combined W. U.-A. U. office is kept open day and night, and is operated by about 12 day and 3 night men.

Mr. A. G. Wallace takes charge of the office at Front and Chestnut streets, one of the most important branch offices in the city, vice Mr. John C. Benckert, resigned. Mr. David A. Curl remains at "C. D." (307 Walnut street), where he has done such yeoman service for years past.

The position of transfer agent, made vacant by Mr. Garwood's change, is abolished. The money order department has been placed in charge of the cashier, Mr. Jamison, who will have for his assistant Mr. Joseph Kenney, late cashier of the American Union Company.

This entire system is under the supervision of Manager Jones. Mr. Jones, though a very young man, has made a long and honorable record—as an operator unexcelled in judgment and skill, as an electrician, as the agent of the Associated Press, and as an able and indulgent executive officer. He has been continually at work, literally night and day, since entering the American Union service, July 5, 1879. This incessant labor was maintained even after he returned to the Western Union service in their Philadelphia main office, until now, under his fine discipline, it is the model office of the country. He is at present absent on a well-earned vacation, and will during his trip visit New Orleans and other cities in the South and Southwest.

The operating room loses one of its oldest standbys and most able electricians in the withdrawal of Chief George W. Porter, and while all rejoice at his promotion, and the wider field opened to him in Superintendent Zeublin's office, there is noticeably a feeling of regret at his departure.

Mr. Carley, late cashier, who has been for 30 years in the telegraph service, also leaves a void hard to be filled. He was private secretary to Mr. William M. Swain, when that gentleman was president of the Magnetic Telegraph Company, and has always stood high in the estimation of each succeeding set of officers. He resigns to establish himself as a member of the firm of John T. Vansant & Co., manufacturing silversmiths, in Philadelphia.

#### A New Species of Telegrapher.

BY W. L. ALDEN.

It was the birth of a child in this city last February with a peculiar pair of feet that led a devoted student of anthropology—a member of the Royal Development Society—to begin that remarkable investigation of the nature and habits of the telegraph climbers which has resulted in establishing the fact that we have a new species of man among us. The child in question—a boy—had on the inside of each foot, and at a distance of two and a quarter inches in a southerly direction from the inner shoe-string, a sort of horn, two inches long, half an inch in diameter at the base, and tapering to a sharp point. The resemblance borne by this extraordinary natural spike to the iron spike worn by the professional climber of telegraph poles, and the fact that a telegraph climber was the father of the child, suggested to the anthropologist that here was a wonderful illustration of the theory of development, and led him to make the first thorough study of the telegraph climbers that has ever been made.

The existence of the professional telegraph climbers has been known for many years, though the first mention of them by any scientific authority occurred in 1870 (*cf.* Harkness' monograph on "Poles; Geographical, Hop and Others"). The telegraph climber, who may now be almost daily seen in this city, resembles an ordinary man in appearance, with the exception that he wears spikes in his shoes, which enable him to climb telegraph poles with great ease and

rapidity. Most people pay no attention to a climber unless they happen to see him in the act of running up a pole, or unless he drops a hatchet or other heavy tool on their heads, and they will learn with surprise that in the course of the last ten years he has undergone a most extraordinary and interesting development.

We learn from the investigations of the anthropologist already mentioned that the telegraph climber is shy and silent. When on the surface of the ground he walks awkwardly, and hence, in order to avoid attracting attention, he rarely, if ever, walks along the street except under cover of darkness. This assertion may seem novel at first glance, but if the reader will reflect for a moment he will probably be compelled to admit to himself that he has never seen a climber in any other situation than that of clinging to the upper part of a pole or of leaning quietly against a pole while standing on the sidewalk. That the climber never speaks, but communicates with his kind solely by signs, rests wholly upon the assertion of the anthropologist, but there is really no reason to doubt the truth of the assertion. He may not have entirely lost the power of articulate speech, but that he should lose it is what might be expected in view of his isolated life among the lofty telegraph wires.

The telegraph climber never sleeps in a house or on the ground. At nightfall he seeks a convenient perch on the cross-bars of a telegraph pole, where he slumbers till morning with his arms clasped around the body of the pole and his spikes driven into the back of the cross-bar. The position is a very peculiar one, since the climber's legs are doubled backward so that his feet are in close proximity to his back; but it is also a very secure one, and no instance of a climber losing his hold and falling on the head of a midnight drunkard has been reported. The favorite poles for sleeping perches are those on the Battery and in some of the small city parks, where the foliage of the trees partially hides the sleeping climbers. They are, however, safe from observation, since no one thinks of gazing upward toward the top of a telegraph pole after dark.

A tendency to construct nests among the telegraph wires has been noticed in several instances. The investigator found a climber's nest on the top of a pole in the Central Park and another on the top of a pole near the Palisades. These nests were little more than rude platforms of boards covered with straw, but in each case the nest was occupied by the mate of the climber with a family of young climbers. Usually, however, the climber makes his nest on the roof of some high building over which the telegraph wires pass. Thither he stealthily carries straw and bits of old canvas, and in these quiet retreats, far above the predatory boys of the street and the too-curious policeman, he rears his young, who, with their mother, never descend to the street. The young male climbers learn to climb from house to house and from pole to pole by means of the wires, and on reaching maturity join the adult climbers in their daily occupations. Of the food of these curious people the investigator was able to learn nothing with certainty, but he is inclined to believe that they have forgotten the use of fire and that they take their food whatever it may be, uncooked.

There is every indication that the telegraph climber is gentle and inoffensive, and that when he drops a hatchet or a glass insulator on an unfortunate pedestrian it is by accident. Whether the development of this singular species, which the able anthropologist has named *homo perticensis*, can be called progressive, or whether it is retrogressive and in the direction of the aboreal *quadrumana* is a question which every evolutionist must decide for himself. The opinion of the anthropologist himself is that the telegraph climber is a new species of man adapted to meet the conditions of telegraph poles, and that if we admit the telegraph to be an improvement upon earlier means of communication we must consider the climber as an improved man. It is possible that this argument is not as forcible as it seems, but the fact that a new species of man has been developed, and that this species is well worth the study of all believers in the theory of development, will hardly be denied. The report of the anthropologist's investigation, which has as yet been printed only for private circulation

will soon be issued by the Royal Development Society, with the imprint of the well-known London publishers, Shortmans & Co., and will then be readily accessible. Until then he has modestly decided to keep his name, as far as possible, out of the papers.

#### Presentation to Mr. Dealy in England.

Mr. W. J. Dealy, who has been in England since last June selecting offices, organizing staffs, etc., in that country, for the American Telegraph and Cable Company, was the recipient, before leaving London to return to New York, of some handsome souvenirs from the staffs of the London and Penzance stations.

Mr. Dealy's passage had been secured for the Wisconsin, sailing on the 22d, but, owing to a sudden call from headquarters, he was using every effort to obtain a berth on the Arizona, sailing on the 15th. On the 14th the metropolis was visited by a terrible gale, which caused great destruction of property and loss of life. Telegraphic communication was entirely stopped, poles being blown down in all directions. On this account Mr. Dealy desired to start for Liverpool and see if a stray berth could be procured at the last moment.

At 6 P. M. on the evening before he left, the full London staff—with the exception of Mr. J. Ball, who has been in ill-health since his return from New York, and was then lying ill in bed at his home in Birmingham—mustered at the office at 21 Royal Exchange, and Mr. Dealy having been sent for from the executive offices in Gresham House, was surprised to find them waiting for him. He said he was glad to have the opportunity, and commenced saying "good bye," but was stopped by Manager H. E. Robson, who said that, excepting to himself, Mr. Dealy had arrived a perfect stranger to all those who were now around him; yet, as he was about to return to America, those who had been so short time ago strangers to him could not let him go without some slight token of esteem. His genial manner and kindness of heart—all so foreign to many they had as superiors—made them feel that they were parting with a friend of long standing. Mr. Robson said he had a second pleasing duty to perform on behalf of the Penzance staff, who also desired to show their appreciation of the sterling qualities inherent in the true gentleman, and though they regretted that they should not see him before he left England, they sent their farewell in the shape of a letter signed by the whole staff, and deputed him to select and present their souvenirs.

After some further remarks, in which Mr. Robson said that, having had the pleasure of nearly twelve months' acquaintance with Mr. Dealy in America, where he was liked and esteemed by all, he was not surprised at the feeling exhibited by the Englishmen toward one who could show consideration for and treat those who were his subordinates as men, he concluded by saying that the peculiar troubles which seemed to reach all new cables had reached their's particularly early, and though they were having an enforced time of leisure he trusted that when once the A. T. & C. Co. was in active operation those selected by Mr. Dealey on this side would be found ready and able to handle the rush of business they all desired. They hoped they should meet him again, and that he would always be able to look back with satisfaction on those he had banded together under the American shield in England. Mr. Robson then presented Mr. Dealy, on behalf of the London staff, with a box of Havana cigars, to assist in whiling away the tedium of the passage; a meerschaum cigar holder and Morocco leather cigar case, bearing the inscription in gold letters: "Presented to W. J. Dealy by the London staff of the A. T. & C. Co., Oct. 22, 1881," and on behalf of the Penzance staff with a splendid black calfskin, silver-mounted, illuminated album, bearing the inscription on a silver shield: "Presented to W. J. Dealy by the Penzance staff of the A. T. & C. Co., Oct. 22, 1881," and a silver watch case, with the monogram, "W. J. D." Had time permitted they would have sent their *cartes* for insertion in the album, but he could be assured these would follow at no distant date, and on behalf of the two staffs he wished Mr. Dealy, after four months' sojourn in the old

country, which he hoped had been pleasant, a safe, speedy and pleasant passage, and a happy family reunion.

Mr. Dealy, who was greatly affected, said that the occasion being a thorough surprise he thanked them. Here he broke down, and said he could not speak, but would have to write his thanks.

#### The Beginning of the Telegraph.

The practical problem with Mrs. Dods was "to find your hare." The practical problem in electricity is, if not to find your force, to keep your current. It ceaselessly aims at flying from you, losing itself in the air, in the earth, being diffused, dissipated. The ancient Greeks, by rubbing amber or electron (which has left its record very clear to all time in the word electricity) got a kind of current; but they could not catch it properly and tie it to a wire as we now do; and the aim of scientific men has been, and still is, the search for the most effectual means of tying the current to the wire, or finding the most efficient insulators. And as it is throughout the whole world of nature, so it is here. As the old divine eloquently said, "All things are set over against each other and there is nothing single or separate." When you have once chained your current well enough, by an inevitable law it generates another. One of the greatest discoveries of Faraday—that most patient, imaginative, and self-denying of investigators—was that, if a current of electricity passes from a battery along one wire, it develops a current along another and passive wire stretched near it. When Faraday's wonderful discovery of the generation of a current of electricity in a passive wire stretched near a charged one had led to the discovery of relays, new possibilities for telegraphy seemed to be opened on all sides, and these do not seem even yet to have been practically realized even remotely. But to enable the reader to realize even faintly the high point which telegraphy has now reached, we must take a hurried glance at the development of the system from the beginning. The assertion is certainly fully justified that the first great step in practical telegraphy was made when the true function of a wire in maintaining a current and producing a signal at the end was clearly grasped. Oddly enough, the first realization of this seems to have fallen to a Scotchman. In the *Scots' Magazine* for 1753 we find record of an "expeditious method of conveying intelligence" described under the initials C. M. There is some doubt now as to who this C. M. was. Sir David Brewster says that he was a Greenock man named Charles Morrison; others give his name as Charles Marshall. Be that as it may, C. M. had caught a vision of the great goal. He aimed at the complete insulation of the conducting wire, and producing a signal at the end of the wire which should be visible and intelligible. He did not attain to the next step of producing many signals by one wire; he used a separate wire for each letter of the alphabet. But the principle in his case was clear—he telegraphed. The little that is known of him may be given in the words of an elderly Scotch lady, who remembered a "very clever man of obscure position who could make light write and speak, and who could light a room with coal-reek." It was a considerable time before the idea clearly dawned on electricians that one wire and needle could be made to represent several letters of the alphabet. When, by slow degrees, the wires and needles had been reduced to the lucky number five, we may say that a great step in the needle-form of telegraphy has been inaugurated. It was by means of one of these five-needle instruments that the capture of the notorious Tawell, the Quaker murderer, was effected, and a quaint incident is told in connection with it which fixes it the more firmly in the memory. In spite of its five needles the instrument could not make the letter "q," and but for the ingenuity of the telegraphist, who spelt the word "Quaker" "Kwaker," the murderer would in all probability have escaped. But five-needle instruments, useful as they proved in those days, are now looked upon by practical telegraphists as odd specimens of antiquity. It took nearly a whole century from the date of C. M.'s somewhat rude invention to make the next fruitful and definite step. Then it was that Messrs. Cooke and Wheatstone introduced what is known as the double needle

telegraph. On the night of June 25, 1837, it was subjected to trial by wires stretched from Euston Square to Camden Town. At the one end stood Mr. Cooke, at the other Prof. Wheatstone. "Never," says one of the inventors, "never did I feel such a tumultuous sensation before as when, all alone in the still room, I heard the needles click, and as I spelled the words I felt all the magnitude of the invention, now proved to be practical beyond all cavil or dispute." The double needle telegraph held its own with considerable distinction for many years, and even now at many of the smaller post-offices and on most railways its lineal descendant is to be found in the handy single needle instrument, which is electrically and mechanically just a double needle cut in two.—*Fraser's Magazine*.

#### What the Doctors Say about the Blanchard Foods.

NEW YORK, Nov. 1, 1877.

From the practical tests I have given the Blanchard Foods, I think they will prove of great value to the invalid, and they should be thoroughly indorsed by the medical profession.

EGBERT GUERNSEY, M. D.,

18 West Twenty-third street.

NEW YORK, Oct. 17, 1877.

I have prescribed the Blanchard Foods to a large number of my patients, with good results in the great majority of cases. As many pretentious "medicinal foods" had proved unsafe in prolonged administration, I hesitated to sanction the use of these until assured of the honesty of the preparations and claims of Dr. Blanchard. I have seen their beneficial action upon persons exhausted by mental strain, wasting disease and by the insufficient nourishment of extreme poverty, thus proving them truly a Food Cure. Until dietary laws are fully understood there will be need of nerve foods, and we must of necessity avail ourselves of the labors of men who devote time and labor to the preparation of such valuable helps to the invalid.

JAMES ROBIE WOOD, M. D.,

62 West Seventeenth street.

NEW YORK, Nov. 26, 1877.

DR. V. W. BLANCHARD: During the past year I have prescribed your various preparations of Food Cure, and feel happy to say they have met my most sanguine expectations, giving to patients long enfeebled by blood poison, chronic disease or over drug dosing, the needed nutrition and nerve force.

PROF. CLEMENCE S. LOZIER, M. D.,

Dean of Hom. Med. College and Hospital for Women, New York City.

ANDOVER THEOLOGICAL SEMINARY, }

ANDOVER, MASS., March 29, 1878. }

Your Life Food is an excellent thing. I have no hesitation, after a thorough trial of it, in recommending it in cases of chronic dyspepsia and nervous prostration.

REV. DR. AUSTIN PHELPS.

—Advt.

#### Linemen Affording Interest to the Crowd.

Anyone who has noted the vast crowd which the hoisting of a large safe into the third story of a building will bring, and the apparently intense interest which it creates, will hardly be surprised that the mysterious operations of the linemen are equally as interesting to the great body of humanity. According to the *Baltimore News*, the amount of entertainment that can be extracted from a telegraph pole by an average Baltimore audience is perfectly marvelous. A fair illustration of this has been given for several days past on Baltimore street. The digging of the hole elicited intense interest from an immense crowd, who manifested the same eager attention at every hole that was successively dug. A lofty female dancing a can-can would not have riveted the masculine gaze more intently than did each pole as it went end upward toward the perpendicular. No time was lost by the breathless gazers. A hasty lunch or no lunch at all, a minute inspection of each pole and a casual one of the workmen's lunch basket at midday, was all that interfered with the rapt admirers from the rising of the sun unto the going down of the same. The punctuality of the crowd, too, testified to their keen enjoyment. We do not believe that one of them missed a pole, which argues well for the relish of the mob and the interesting character of the performance.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

Entered at the N. Y. Post-office as second-class matter.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, NOVEMBER 15, 1881.

Americans visiting Europe will find *THE OPERATOR* on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

### THE MUTUAL UNION.

The hope which was cast down on the 19th of January last, with the sudden collapse of anything like opposition to a telegraphic monopoly, is revived with the opening, within nine months, of a real, live enterprise—the Mutual Union Telegraph Company. Progress rarely goes in a straight line, but its apparent deviations only emphasize, as in this case, its irresistible onward motion. It is so with the telegraph, and the despondency which set in immediately after the Consolidation now clears away to reveal a broader and wider field for the Telegraph. The experience of the past half year has shown us that capitalists are always ready to open their purses to further a solid telegraphic enterprise; that a level-headed man can always obtain for the simple asking all the money he wants to build an opposition line; that a telegraphic monopoly is really an impossibility in this country, and that the saying is true that, "The necessity of the telegraph itself is the unconquerable antagonist of monopoly."

The construction of the Mutual Union has been rapid, but it has been done in a business-like way. That is its first step well taken; the next step forward has been secured, and it is, we hope, now going steadily on to its day of triumph. Within another year it will include nine-tenths of the profitable telegraphic business of the country; its comparatively small capital must be very profitable, and it cannot fail soon to pay a handsome dividend upon its authorized capital of ten million dollars.

Business can be better captured and retained by rendering efficient service than by reducing rates. Prompt dispatch secures increased business, and where better facilities are afforded to the public it increases trade. A commercial message, even one charged for at a higher rate, promptly delivered, will often make it necessary for the merchant to send three or four other messages. Complaints lately from the various exchanges in this city have demonstrated that the facilities between the East and the West are not adequate for the prompt transmission of business during that fraction of the day called "business hours." Business can thus be cultivated, and in doing this we may safely trust the executive officers of the Mutual Union Telegraph Company.

THE interesting account which we give in this issue of the attempt of an operator to swindle the Erie Railway out of \$55,000, will recall some of the big schemes attempted of late years by a new class of swindlers, who practice the tele-

graph confidence game. These reminiscences should be widely circulated, as a means of putting the general public on its guard. On the 12th of August, 1865, one T. F. McCarthy brought the following message to the Western Union office at Titusville, Penna.: "Keystone Bank Company will pay on checks of T. F. McCarthy to the amount of \$20,000 (signed) Keystone Bank." On the strength of this dispatch, and one or two supplemental ones, Mr. McCarthy got his check cashed for \$10,000, disappeared and has never since been heard from. Another neat and successful job was carried out at Pittsburgh, Penna., March 13, 1877, by an operator calling himself Brooks. He tapped the wire near Templeton, and with the aid of a pocket instrument sent a message to the express messenger on the Buffalo express south, informing him that he (the messenger) was relieved, and ordering him to turn his car over to J. H. Brooks at Templeton. This was signed with the superintendent's name. At Templeton "Brooks" was on hand, obtained possession of the express car, and, when the train reached Pittsburgh, walked off with a snug pile—between \$5,000 and \$10,000—and was never again heard from. A few years ago an operator named Charles Crowley sent a forged message to the Bank of California, calling for \$1,200, went down and drew it himself, and walked off into total obscurity. Every one remembers the raid on the stock market made a few years ago by a bogus message announcing the death of Commodore Vanderbilt. Minor swindling schemes by use of the telegraph are too numerous to mention. But, so far from reflecting upon the profession, these robberies emphasize the probity and uprightness of the average operator, into whose hands so much is intrusted and to whom daily temptation to such rascality is placed in his path. The only wonder is that with the encouragement given to every Tom, Dick and Harry to learn the mysteries of the profession, and the beggarly "salaries" offered to some naturally bright young men, the Pennsylvania Railroad paying its operators \$29 per month, these easily executed robberies do not oftener occur. It is an argument against the indiscriminate admission of candidates to our profession, and in favor of our plan for placing some restrictions upon the manufacture of operators in the matter of the moral character of the student as well as his general intelligence and adaptability.

THE cost of electric lighting in this city, as compared with the cost of lighting the same open spaces by gas, has recently been investigated by the *Sanitary Engineer*. The Brush Electric Light Company receives \$7,400 per annum for lighting Fourteenth street from Fourth to Fifth avenue, Fifth avenue and Broadway from Fourteenth to Thirty-fourth street, and the latter street from Fifth avenue to Broadway. In addition to the lights on these streets the company is required to furnish two groups, of six lights each, in Union and Madison Squares, respectively. The street lamps have been in operation several months, those in the squares for a shorter period. The illumination is said to be fairly satisfactory, though, as was anticipated, the tower lights are effective only upon a small area, and it is likely that their effect will be seriously impaired by the heavy foliage in summer time. The total number of gas lamps which it has been possible to extinguish by the substitution of electric lamps is 430. The city formerly paid \$17.50 per lamp per annum, which is estimated to have been at the rate of about \$1 per

thousand cubic feet, net, and this rate was so low that the gas companies did not care about lighting the streets. The gas lights, therefore, cost the city (and probably the producer) \$7,525 per annum, and are replaced by the electric light at a cost of \$7,400. It is not known, however, whether the Brush company makes or loses money at this rate. The advertisement alone is worth something, and it is possible this was taken into account in making the contract. At all events, there seems to be very little margin of difference where gas is furnished at one dollar per thousand cubic feet. This, however, is only one-half the cost of gas to private consumers in this city.

THE demand for good operators, consequent upon the rapid increase of the opposition to the Western Union, is on the increase, and good operators are scarce. But, unfortunately, the average economical manager is not in search of good operators as much as cheap ones. Of this class—men who can just worry through a day's work without wrecking the company's reputation—there is a glut; and those who are familiar with the great number of "operators" being constantly turned loose, from the so-called colleges will see that we sound no false alarm when we say that some restriction should be placed upon the wholesale manufacture of this kind of operators. The next consolidation, or a decline in the present unprecedented volume of business, will place a good many men in enforced idleness. In view of this fact, it becomes the duty of every telegrapher who has the welfare of his profession at heart to use all his influence to defeat this overcrowding of our ranks by cheap and incompetent men. Not much is to be expected from the average manager, but there are still some of that class of officials who have themselves toiled at the key for years, and who bear still some of the old fellow-feeling, who will enter into the spirit of this laudable enterprise.

It would seem that those worthy young men, mostly telegraphers, comprising the sergeants of the Signal Service, are not being fairly treated by the War Department. The law requires that two of these sergeants may be appointed every year to be lieutenants in the regular army, but the law has heretofore been woefully neglected, and favorites in the regular army have been assigned to easy berths in the Signal Service, thus closing the door of advancement to the regular Signal Service men, and preventing them from rising above the rank of sergeant. Gen. Hazen, Chief Signal Officer, stoutly maintains the claims of his men, while Secretary Lincoln and General Sherman are found in favor of the carpet-knights. Now, if Gen. Hazen will at once name two worthy sergeants for promotion to the rank of second lieutenant, he will not only do a meritorious act, but will also bring the squabble to a crisis. The efficiency of the Signal Corps demands that this law with regard to promotions be scrupulously fulfilled, and common justice demands that the worthy men forming the Corps should receive the commissions for which they have worked so hard.

ONE J. Howard Welles has been arrested in this city for threatening to shoot Jay Gould. In his tender epistle to Brother Jay he says. "You must undoubtedly be aware that you have been a rogue of the first water all your life, that through your artful cunning and deception you have robbed thousands of people of their birthright. You have had no mercy.

You have robbed the rich and the poor, the father and the fatherless, the widow and the orphan, indiscriminately of their last dollar, and through your villainy have brought ruin and destruction on thousands of families. All this you have done under a cloak by circulating false reports, bribing newspapers, making false statements, committing perjury, and by artful cunning and deception. \* \* \* The Lord has applied to me in a dream and requested me to slay you as a public necessity, and I have sworn and taken a solemn oath before the all-living God that I will put you to death." Mr. Gould, however, is still alive, and Mr. Welles languishes in the Tombs.

At the late meeting of the Iron and Steel Institute, England, Dr. Siemens showed how steel could be economically melted by the electric arc. An ordinary plumbago crucible is placed in a metallic jacket or case, and the intervening space is filled up with charcoal or some other bad conductor of heat. Through the bottom of the crucible a rod of platinum or dense carbon passes. A hole in the cover of the crucible admits the negative electrode, which is suspended at the end of a beam by means of a strip of copper. The other end of the beam is attached to a hollow cylinder of soft iron, free to move up and down in a coil of wire, one end of which is connected with the positive and the other with the negative pole of the arc. Five pounds of steel were melted in 25 minutes.

GUIDED by past experience, the operators do not seem inclined to relax their vigilance in looking after their own interests. The attempt commenced last spring by certain Western Union officials to reduce salaries and to enforce gratuitous extra work was promptly checkmated by the firm stand made by the operators. The events of the two weeks just past show that none of this power, which resides alone in unanimity of purpose, is to be lost. So far there has been no exultation, no threats—every act of ours has been as quiet and dignified as it was determined and justifiable—and it only remains for THE OPERATOR to advise its readers, in their newly-found power, to foster the same spirit of self-control which has characterized their action heretofore.

A SENTENCE in our Philadelphia notes saying that that city, being in a central position, is frequently called upon to supply relays of operators to surrounding cities in emergencies, leads up to the question whether or not it would be advisable for the large competing companies here to organize a trained staff, the same as the "special staff" in England, to move at a moment's notice from town to town. Such a reserve force, composed of the flower of the profession, would be a valuable reinforcement whenever any particular office was hard pressed, and the experiment would, we think, be well worth trying in the Eastern States.

Two years ago, on the 18th of this month, the steamer Faraday arrived off North Eastham, Mass., and picking up the shore end of the new French cable, completed another link between the old world and the new. Mr. D. H. Bates was then President of the American Union, and we were all looking forward to an era of great telegraphic prosperity. In the short time intervening Mr. Bates has become Assistant General Manager of the Western Union, another new cable has been laid, another new domestic company has replaced the short-lived American

Union, and, altogether, telegraphic affairs have changed generally.

WE have received a number of pleasant compliments in reference to the appearance of our last issue. Many substantial ones, too, in the shape of new subscriptions, have also reached us. Our advertising friends, however, wishing to take advantage of the unprecedentedly large number of copies issued, rather crowded us with their favors on that occasion. It is well to remember, though, in this connection, that were it not for the revenues derived from advertising, THE OPERATOR of to-day could not be furnished for less than at least three times the present subscription price.

IF the visit of Prof. Siemens to this city shall result in the application of electricity to the running of trains on the elevated railroad, it will be a great boon to the property owners along the various routes, who will be glad to get rid of the smoke and the cinders. The Professor thinks that the use of electricity as a motive power would result in a saving of \$1,000 a day, and if this shall prove true, it will be also a boon to the company.

IF the Mutual Union Company still retains that \$250 which it claims was the bribe-money offered to one of its clerks by the Western Union, it certainly cannot conscientiously stick to it; and, since the Western Union will never claim it, it might be well to turn over the \$250 to the Telegraphers' Mutual Benefit Association. What does President Evans say to that?

THE felicitous results of the test, in Philadelphia, of Dr. Lugo's "solenoid" wire should be most encouraging to the advocates of underground wires, since it clearly demonstrates that the trouble dreaded from induction in subterranean telephone wires can be completely overcome.

Two more lunatics—Joseph Campbell, at Bluffton, Indiana, and Louisa Kelsey, at Celina, Ohio, have been married by telegraph, there being a minister and a wedding party at each end of the wire. "Mr. and Mrs. Campbell," the dispatch naïvely adds, "expect to meet some time next winter."

ANY of our readers of the Signal Service will confer a favor by sending us a list of the promotions in the Corps from sergeant to second lieutenant since the passage of the law providing for such promotions.

THE Western Union Telegraph Company shows public spirit in directing that all messages on business concerning the Garfield monument, at Cleveland, shall be sent free to all parts of the United States.

NEXT Thursday week, the 24th inst., will be Thanksgiving Day, and among all the professions and trades none has more reason to thank an indulgent and omnipotent Providence than the telegraphic profession.

OUR hearty congratulations are extended to the Mutual Union Telegraph Company upon its auspicious opening. May it do better than that monstrous fizzle—the American Union!

THERE is in the Paris Electrical Exhibition an induction coil capable of giving a spark forty-two inches long and piercing a block of glass six inches thick.

### Important Tests With the Telephone, Telegraph and Electric Light Wires Underground.

Cables were placed in the conduits recently laid down by the National Underground Electric Company, on Market street, Philadelphia, and on Saturday, Oct. 29, a most successful and interesting exhibition was given, in the presence of a large number of electricians and Philadelphia, New York, Boston and Chicago capitalists. The cable was doubled so as to represent a straight length of two and a half miles. Five wires were in use—three for telegraphic and two for telephonic purposes. In addition to these there was an electric light wire run from the dynamo-electric machine at Wanamaker's Grand Depot to the place where the exhibition was given, the new Public Buildings, Broad and Market streets.

The most important part of the test was the clear manner in which it was demonstrated that subterranean wires can be used for telephonic circuits equally as well as for the telegraph, the trouble heretofore experienced from induction having been completely conquered. This was accomplished by the use of "Solenoid" wire—the invention of Dr. Orazio Lugo. This is a double wire—one straight insulated wire about and around which its companion wire, also insulated, is wound spirally. In accordance with the principle discovered by Dr. Lugo, all induction is neutralized in this way.

At a private inspection on the previous day, Mr. Joseph Christie, of Philadelphia, under the guidance of Mr. J. F. Shorey, of Boston, made a critical survey of the entire system, descending the "man-holes" in the street, and applying the severest tests to the solenoid wire, and gave it as his opinion that the invention of Dr. Lugo is perfect in overcoming induction. A telephone attached to an ordinary wire gave forth all the bewildering crackling sounds, and the word "ship," written on a neighboring Morse circuit, was, through induction, plainly read by sound on the telephone. The same telephone, detached from the ordinary line wire and attached to Dr. Lugo's solenoid wire gave no sign of induction.

The same experiments were repeated next day at the public exhibition, and so clearly that the utility of the solenoid was apparent to even those not familiar with the subject. But its value was best demonstrated by the test of placing an electric light wire in close proximity to the telephone, and thus showing an entire absence of induction. The solenoid wire running from the dynamo-machine in the Grand Depot to the carbon points of the electric light in the room where the exhibition was given was coiled to the length of one mile, and placed on the top of a similar length of telephone wire, the two coils being separated only by a sheet of paper. With a strong current from the dynamo-machine running through one coil, there was no induction perceptible in the other, and a whisper on the telephone was plainly audible through it.

Lucid explanations were given by Dr. Orazio Lugo and Frank L. Pope, of New York, and J. F. Shorey, of Boston.

There were present James Gamble, General Manager of Mutual Union; John E. Zenblin, Superintendent of the Western Union; Gen. J. H. Wilson, of Boston, President of the New York & New England Railroad; David Brooks, James Partrick, Henry Bently and William B. Gill, of Philadelphia; S. L. M. Barlow, George L. Phillips, of the American Bell Telephone, Boston; T. E. Cornish, Manager, and W. D. Sargent, General Superintendent Bell Telephone, Philadelphia, and many others.

After the exhibition, the Board of Directors of the Underground Electric Telegraph Company held two meetings in Philadelphia to consider propositions presented by the New York representative of the Mutual Union Telegraph Company for the rental of a portion of the company's conduits which are now being laid on Market street. It is believed that satisfactory terms, which have not been made public, were agreed upon.

## THE POETRY OF WORDSWORTH.

Elsewhere is announced a new edition of the poems of William Wordsworth. In this country, as in England, the poet of Nature is steadily gaining in popularity. As a rule, the age of newness and curiosity being passed, every fresh reader becomes a friend and admirer of such poetry as his, which "wears well." Those who have once taken a drink from the pure, cold fountain of Wordsworth's inspiration will often return thereto, to cool the heat of life's fever. The writer remembers his first introduction to the greatest poet of the century. He was a school-boy then, under a preceptor of a just literary taste, who permitted him to know what were the books at the time engaging his attention. At the epoch referred to—for it proved to be an epoch in the individual history of him who pens these words—a volume of Wordsworth's Sonnets was among the literary treasures on the master's desk, and the pupil read the divine apostrophe to Milton:

"We are selfish men;  
Oh! raise us up, return to us again;  
And give us manners, virtue, freedom, power.  
Thy soul was like a star, and dwelt apart;  
Thou hadst a voice whose sound was like the sea:  
Pure as the naked heavens, majestic, free,  
So didst thou travel on life's common way,  
In cheerful godliness; and yet thy heart  
The lowliest duties on herself did lay."

These words placed one more disciple at the feet of a prophet who perceived and felt above all others the deep harmonies of Nature—their power to soothe and heal, to chasten and subdue the passions, to refine and to endow with an abiding happiness. From that time to now, every day spent without some companionship with Wordsworth has seemed to be, for this reason, an imperfect one.

No poet is more tenaciously admired than Wordsworth, and no poet has been the subject of more flippant criticism. The distinction between "is" and "has been" in the preceding sentence is one well considered. Wordsworth's poetry has survived the attacks of small wits, and is ranked among the best which gives an unmatched distinction to English literature. The critic can now write Shakespeare, Milton and Wordsworth as the greatest names in English verse, and his judgment is not the subject of a sneer. Fifty years ago this estimate, which is extensively and increasingly accepted, would have been received with surprise, if not with contempt. Wordsworth's poetry has proved like gold tried in the furnace.

Admitted that Wordsworth, like the most of people, had a crotchet. His earlier poems were distinguished by an affectation of simplicity as to subject and style, which his ingenious defense thereof failed to justify. But his genius survived an inconsiderable weakness of its immaturity. The English language has rarely reached such copiousness and majesty of diction as in many passages cullable from the works of the Lake poet. For example:

"Within the soul a faculty abides,  
That with interpositions, which would hide  
And darken, so can deal, that they become  
Contingencies of pomp, and serve to exalt  
Her native brightness. As the ample moon,  
In the deep stillness of a summer eve  
Rising behind a thick and lofty grove,  
Beams like an unconsuming fire of light  
In the green trees; and, kindling on all sides  
Their leafy umbrage, turns the dusky veil  
Into a substance glorious as her own,  
Yea, with her own incorporated, by power  
Capacious and serene—like power abides  
In man's celestial spirit; Virtue thus  
Sets forth and magnifies herself; thus feeds  
A calm, a beautiful and silent fire  
From the encumbrances of mortal life,  
From error, disappointment—nay, from guilt;  
And sometimes, so relenting Justice wills,  
From palpable oppressions of despair."

The enthusiasm of a steady admirer is perhaps excusable, even when it leads him to deprecate the omission from any edition

of Wordsworth's works of the poems which so wonderfully exercised the pleasantries of certain critics upon their first appearance. There must be more than their simplicity to account for the wonderful popularity of "We Are Seven," "Lucy Gray," "The Pet Lamb," and other early pieces printed and beautifully illustrated in the edition suggesting these remarks. The truth is that their deep undercurrent of thought and feeling influences the popular judgment beyond the carplings of verbal critics with their musty precedents. While "Tintern Abbey" and the "Ode on Immortality" are, of course, infinitely out of the reach of petty criticism, the detractors of Wordsworth should remember that the early poems survive and are published with the unquestionably immortal efforts of his muse. Dear to the universal heart is the doctrine of the survival of the spirits of the dead in another condition of being, and of their sweet kinship with the dear ones left behind but destined to rejoin them in a better life.

"But they are dead: those two are dead,  
Their spirits are in heaven!  
'Twas throwing words away: for still  
The little maid would have her will,  
And said: 'Nay, we are seven.'"

Moreover, the choice spirits of all ages have been touched with the same sympathy expressed with simple beauty in "The Pet Lamb." Burns saw in the field mouse "a poor earthborn companion and fellow mortal." These remarks could be extended further. The claim is not made that Wordsworth never flags or fails, but all that he said has a feeling and a purpose, is grounded on a conviction or a sublime perception which the least dignified expression cannot injure or impair. Moreover, peculiarities which those who do not know and love the poet cannot tolerate, are an interest and a charm to those who companionate with him day by day.

Wordsworth is a personality throughout his poems. He lays bare his innermost thoughts, his deepest feelings. His poems are in this sense egotistical. Their author was not destitute of dramatic ability, as some critics say. The skeptic in the "Excursion," for example, leaves on the writer's mind an impression that his personality is entirely distinct from that of Wordsworth at any period of his life. There is not, to his knowledge, any proof against the presumption that the skeptic is as real a creation as Shakespeare's Hamlet.

A word should be said in commendation of Wordsworth's style. He is eminently scholarly and precise in his employment of language. For this reason, if for no better one—but a better would soon follow—our young people should be encouraged to study his works among those of other masters of the language. In these busy times a correct use of English is most desirable. Comparatively few persons attain this capability, and the statement of one aid thereto may be of service.

This brief review, necessarily incomplete, will, perhaps, answer a useful service as introducing a superb volume which the publisher has produced in time for the holiday trade of the present year. It contains poems of William Wordsworth, edited with an introduction by Richard Henry Stoddard. This feature of the edition gives it a special interest to the numerous admirers of Mr Stoddard, himself no inconsiderable poet, and whose remarks will be found of great value as a piece of criticism. They are discriminating, just and learned, and give an American character to the book which is pleasing and satisfactory to those who desire the development of national scholarship and literary taste, and give them encouragement.

The publisher feels that in presenting this superb book to the attention of the public—a book, by the way, always opportune as a gift, a valuable accession to the library and the home, and the pure instructor and solace of many hours to every appreciative possessor—he is making an experiment for which he can confidently predict success. The poet, the editor and the publisher has each done his part; and now, gentle reader, it only remains for you to do yours.

## Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible;  
Theoretical as far as necessary.

In our last answer, an error crept in, which, by the omission of the decimal point before the figures 35 and 21, materially changed the sense of the words. We therefore repeat the entire answer:

Q. 158. Does the resistance of wire vary with the temperature?

A. Yes; the resistance of all wires increases with increased temperature, and the resistance of nearly all metals increases at the same rate, iron and thallium, according to Dr. Matthiesen, being the only exceptions. From the tables given by Latimer Clark, we learn that the resistance of iron wire increases about thirty-five hundredths (.35) per cent. for each degree Fahrenheit, and that the resistance of copper increases as the temperature rises twenty-one hundredths (.21) per cent. for each degree.

It is also ascertained in the resistances, which increase with increased temperatures. The rate of increase is not reckoned all through on the original resistance, but is, as it were, computed in the same manner as compound interest on a sum of money. For example, if we have a wire which measures 100 ohms at 60° Fahrenheit, and the resistance be increased by a certain amount by a rise of one degree in temperature, it will be increased by the next degree of rise at the same rate per cent., calculated on the original resistance, plus the amount increased by the first degree of rise.

Q. 159. The diameter of any iron wire being given, how may the weight per mile be ascertained?

A. If we know the diameter of any size of iron wire, in mils., or thousandths of an inch, we may find the weight per mile by dividing the square of the diameter in mils. by the steady number 72.15.

For example, we have a No. 12 iron wire, and wish to find its weight per mile. It is, we will suppose, 109 mils. in diameter. The square of 109, or 109 multiplied by itself, is 11,881. Dividing this number, 11,881, by 72.15, we find the quotient to be about 164½ pounds, which is the weight per mile.

The weight of copper wire is found in the same way, substituting 63.13 for the steady number 72.15.

Q. 160. What metal is usually employed for the conducting wires in underground work, and what materials are chiefly used in insulation?

A. Copper has always been used as an underground telegraph wire, to the exclusion of all other materials; and the most generally employed size is No. 18, covered with gutta percha till it reaches the size of No. 7, B. W. G. In England these wires are wrapped with strong cotton tape, and saturated with Stockholm tar, and drawn through and into leaden or iron tubes, which are then buried. The insulating material has been much varied. Gutta percha and India rubber are, however, the principal materials used at the present day. Almost everything has been tried, but gutta percha has, upon the whole, given the best results when it has been kept from air and insects. Kerite has given satisfaction, and is much used in the United States.

Q. 161. Are covered wires ever used on house-top lines?

A. Yes; in cities, particularly among the centres of business, it becomes almost a necessity to employ covered wires, on account of the great number of wires which cross and recross each other in every direction.

In New York, for example, the Gold and Stock Telegraph Company invariably uses rubber-covered or kerite line-wire, and many troubles of a minor character, to which its lines would otherwise be peculiarly liable, by reason of the high tension currents employed on printing circuits, are thus prevented or rendered innocuous.

Q. 162. When was the first underground telegraph laid and by whom?

A. The first underground telegraph line ever laid was that of Mr. Francis Ronalds, an English gentleman, in the year 1816. He invented a telegraph to be operated by synchronously moving dials, in conjunction with the employment of

static electricity, and worked it over a wire five hundred and twenty-five feet long, which was laid in a trench dug in the earth for that purpose. The wire was placed in tubes of thick glass, and these were laid in troughs of dry wood, two inches square, the troughs being filled with pitch. Mr. Ronalds was a strenuous advocate, at that early day, of underground telegraphs.

Q. 163. Are underground wires at present laid to any great extent, and where?

A. Underground lines are extensively employed in some of the cities of England, and, as constructed, appear to work well. Several long lines are also in use, notably one between Liverpool and Manchester, a distance of about 36 miles. More than 100 miles of piping is laid down in England, and over 3,000 miles of wire.

In Germany, also, there is an extensive underground system, which, instead of consisting, like the English lines, of a large number of wires laid in pipes, is similar to the system of submarine telegraphy; a number of wires are formed into a cable, which is served with tarred rope and armored with galvanized wire, after which it is laid in a trench, under the public roads or highways, and the trench is filled up with bitumen.

Many miles of cable are so laid, and the German government officials have been so well pleased with the operation of this system that they have lately extended its ramifications considerably.

Q. 164. Are underground lines suitable for telephonic circuits?

A. Underground lines, up to the present time, have not been used at all, or not to any extent, for telephonic purposes. There are several reasons for this. Among others, it has been generally supposed, from the too-evident fact that telephone wires, even when a comparatively long distance apart, interfere seriously with each other by the production of indirect currents and other disturbing agencies, that such wires, when laid together in a cable or tube underground, and therefore close to each other, would, owing to the increased vigor of such disturbing currents, be unable to work at all. Inductive embarrassment, that is, the retarding influence of the earth—which of course increases as the wires are brought nearer to the earth—would also have an objectionable effect on telephone wires, and considerably weaken the volume and intensity of the currents which reproduce the transmitted sounds. Remedies for both of these troubles will doubtless sooner or later be discovered. Indeed, many have already been proposed, and have met with more or less success.

The great objection, however, is the enormous expense contingent on a first-class and thoroughly well-constructed underground system, especially in a city system of short lines which have to be tapped at many points. The expense, though, would be nearly all first construction, as, when once properly laid, the wires would be secure from the effects of wind and weather.

Q. 165. What is the metal chiefly used as a conductor in submarine cables?

A. Submarine cables, from the first one laid, that between Dover and Calais, by Brett, in the year 1850, to the last Atlantic cable, have always been furnished with copper-conducting wires, generally in a strand of three or more wires.

### The Mutual Union Office in Boston.

To the Editor of The Operator:

SIR: Between Oct. 4 and 29 the apartment on the ground floor of No. 77 Milk street, corner of Federal, was transformed from a room entirely destitute of furniture—even to gas fixtures—into the finest and most complete telegraph office in Boston, if not, indeed, in New England, and this morning (Nov. 2) the first message was handed in over the elegant receiving counter, to be transmitted over the wires of the "amateur" telegraph company, as the New York *World* designates the M. U. Superintendent D. J. Hern has shown by his work here that his telegraphic experience has not been wasted, for he deserves the credit of the entire work.

The receiving and operating departments are on the first floor, in a room with a frontage of 23 feet on Milk street and 54 on Federal. The two departments are divided by a partition composed of an ash wainscoting, surmounted by

sashes of ground glass, reaching to the ceiling. Opposite the Federal street side the receiving room is divided by a wire screen from a passage way leading from the public room to the operating department. The receiving department is 8 feet deep, and is separated from the public room by an ash counter, with cherry facings, with a plate glass front some three feet in height, broken by two brass wickets, through which to do business with the outside world. Supt. Hern's desk is also in the receiving department. Mr. W. B. Derby is cashier and receiver, assisted by Mr. Martin Connolly. Mr. Hern is assisted in his office work by his brother, Mr. John B. Hern.

The operating department is a well-lighted apartment 31 by 28 feet, and contains eight quartette tables of the approved and improved Western Union style. The switch (which has a capacity for fifty wires) is a very handsome one, manufactured by J. H. Longstreet, of New York, who also furnishes all of the instruments. The relays do not infringe upon the famous Page patent and are the joint production, we believe, of Messrs. Longstreet and J. E. Wright, the electrician of the company. They have not been fully tried, as yet, in this vicinity, but if Mr. Longstreet has bestowed as fine work on them as he has on the switch, their success is assured. The switch frame is of black walnut, and has a substantial look about it which does not suggest consolidation. All of the office furniture (save the chairs) was manufactured by D. B. Chandler, of New York, and was placed in position under the personal supervision of his able assistant, Mr. Sage. The Harwood fibre-seated chairs have an air of comfort about them that is intensely refreshing. The operating force consists of Mr. F. Scott Smith, Chief Operator; Mr. Frederick A. Cloudman, assistant; and Messrs. Jas. H. Burke, J. H. Hutchinson, J. M. Sullivan ("Steve"), Thos. J. McCabe, Edward J. Holden, William Irwin and C. E. Lyman, operators—the latter two nights. William H. Murray and John B. O'Neil are check clerks. A drop tube runs from the operating room to the delivery department in the basement, presided over by Mr. John Corcoran, a veteran in this particular line of business. The delivery department comprises two rooms—one 22 by 11 feet, of which Mr. Corcoran is at present sole occupant; the other 22 by 15 feet, for the accommodation of the messengers. The drop tube from the operating department is arranged so that business will fall on the delivery clerk's desk, directly in front of him. He is separated from the messengers' room by a partition of window glass, arranged in sashes, reaching nearly to the ceiling. The stairway from the street leads into the messengers' room, and to the right of that is the battery room, 22 by 21 feet. The latter is complete in all its appointments. Four stands, with a capacity of 1,200 cells, are arranged so as to allow free access to each individual cell. Along one side of the room is a mammoth wooden tank capable of holding 120 jars, which will render the cleaning process a comparatively easy one. Under the sidewalk of Federal street are closets for battery material, old business, etc., one of them being set aside for the messengers, and containing hooks for their coats and compartments for their hats. The carpenter work on this floor, together with a fine coat-closet, containing 25 hooks, in the operating room, redounds greatly to the credit of Mr. Chas. Frizell, a Boston carpenter.

The wires are brought from the roof, through a well between the office and the adjacent buildings, by means of ten wire cables, and are carried through the basement up through the floor behind the switch. The wires from the switch to the instruments are strung along the ceiling of the basement inclosed in a box, so there is not a wire visible save where they come through the tables at the instruments. The work of running and connecting the wires was done under the direction of Mr. H. B. Potter, assisted by Mr. John Pratt, who are to serve in the capacities of lineman and battery man respectively.

Messrs. Burke, Holden, Sullivan and Hutchinson resigned positions in the Western Union office in this city to accept the situations they now hold. The first three gave in their resignations Oct. 14, to take effect in eleven days. When the matter was reported to Supt. Roche, he at once ordered that the resignations be accepted to take effect immediately, and had it not been for

the generosity of the new company, in placing the men on the pay-roll at once, these gentlemen would have been forced to take an involuntary two weeks' vacation, simply because they wished to better themselves. It is rumored that Supt. Roche issued an order that all resigning for the purpose of going with the opposition would be served in the same way; but, if this be true, three more resignations the following day caused him to revoke it. The indignation among the operators at 109 State street over this treatment was widespread. Some officials seem to regard the respect of their subordinates as something unworthy of an effort to obtain, but it is to be hoped that the day is not far distant when they may have occasion to repent of their shortsightedness. OBSERVER.

BOSTON, Mass., Nov. 2, 1881.

### Swindling by Telegraph.

William J. Sipple, an operator, charged with conspiracy to rob the Erie Railway of \$55,000, was discharged from custody on the 3d inst., but was immediately rearrested on a charge of trying to obtain money under false pretences. He was admitted to bail last week.

Sipple was formerly an operator on the Erie Railway. One night, about two weeks ago, a man, who has since been recognized as Sipple, entered the bell-house, and asked if Mr. Conklin, the operator, had gone. The watchman said that he had gone, whereupon Sipple took possession of the telegraph instrument. For the next two hours he had control of this end of the road. He ordered all stations east of Paterson to ground all wires except No. 1, the wire he was working on. The order was signed with the initials of W. J. Holmes, the superintendent.

Sipple then called Paymaster White at the main office in Jersey City, and in the name of General Bird W. Spencer, the Treasurer of the company, telegraphed him the details of an imaginary plot to rob the safe in the Paymaster's office of \$50,000, the dispatches purporting to come from Passaic. He said that the plot had been discovered by the New York police, who had taken measures to capture the thieves. In order to facilitate the operations of the police it was directed that all the cars be taken out of the depot, and that no trains be started without further orders from General Spencer. He also directed Mr. White to take the paper money out of the safe and put it in the bag, so that it could be carried to a place of safety in case the plans of the police failed. Mr. White obeyed the instructions, and telegraphed back that he had done so. He was immediately summoned to Passaic to confer with General Spencer, and started on the next train, first informing Superintendent Hill of the condition of affairs, and leaving the money in his care. When sufficient time had elapsed for Mr. White to reach Passaic, a dispatch, purporting to come from him, was received by his clerk in the Jersey City office, directing him, by order of General Spencer, to hand the bag of money over to Detective Boylon, from Inspector Byrnes' office. The clerk handed the dispatch to Superintendent Hill, who sent word back that he thought the money would be more secure in the safe, and that he intended to call on the Jersey City police for protection. An answer was returned directing him to say nothing to the Jersey City police.

This was the first thing that aroused Mr. Hill's suspicions, and he telegraphed that he would assume the responsibility of keeping the money in the safe and would deliver it to no one but Mr. Spencer himself. This determination on the part of Mr. Hill baffled the plans of the conspirators, and after telegraphing to Mr. Hill to wait a minute, the man who has been identified as Sipple left the bell-house.

Sipple was subsequently arrested and admitted to bail as above stated.

Another, and more successful, bold scheme was played on the telegraph recently. On the last day of October, Mr. W. F. Loux, employed by Nace & Moyer, dealers in druggists' sundries, at 520 Arch street, Philadelphia, started on a trip to Cincinnati. He was to stop in Pittsburgh the next day, and when the firm in Philadelphia received a telegram from that city signed by him, and dated at the hotel where he usually stopped, they were not surprised. The contents of the message, however, were rather startling. It said: "Please telegraph me money at once. Have been

robbed. Will explain particulars by letter." Messrs. Nace & Moyer were not long in wiring their salesman fifty dollars, and the next day they received another telegram, signed "W. F. L.," to this effect: "Order received. Will write this evening." In vain did they look for the letter of explanation. Several communications were received, but none of them mentioned the robbery. They were all of a business character, and included a number of orders. The firm thinking that probably the matter was a rather tender subject with their young man, refrained from referring to it; but the salesman's sister hearing of it wrote to her brother making inquiries, and received a letter stating that she was the first to make known the fact to him. He was very much surprised to hear of the robbery, and was still more astonished to know that \$50 had been telegraphed to him and that he had never received it. The whole affair was evidently the work of some clever swindler. No clue has been obtained as to who the person is, and there is very little chance of his detection. The firm's experience, however, may serve as a warning to other business men.

### Electricity as a Motive Power.

A correspondent of the London *Times*, writing of the Electric Exhibition at Paris, under date of Sept. 14, says:

"During the last few days a number of new machines have been in action to show the different applications of electricity as a motive power. This is a special branch of the subject, which will attract a large number of visitors. Most of the machines of this class are in the northwest corner of the building. Here the plowing machine of M. Menier is exhibited by M. Félix, and, although it does not actually plow the ground, it is interesting to see the way in which the electro-motor drags the plow with three shares across the space devoted to it, while a workman sits in it and guides its direction. Then there is a circular saw driven by electricity. The diameter of the saw is three feet, and the planks upon which it works are five inches thick. M. Piat exhibits in the same part of the building a stone cutter and an electrical hammer, which does all the work usually assigned to a steam hammer. Close to these machines is another for pumping water, driven by a Gramme motor; the large volume of water which is thrown out conveys to the eye some idea of the great force which can be transmitted by electricity, although in reality this machine does not require nearly so much force as many other motors in the exhibition. In the same corner we find a number of machines for sewing and for driving band saws, and so forth, all driven by the convenient little motor of M. Deprez."

### TELEPHONE DEPARTMENT.

"Telelogue" is gravely proposed as the name for a message by telephone.

Germany has been quick to appreciate and employ the advantage of the telephone. In Berlin alone, on October 1, 533 houses were served with telephonic communications, and the total length of wires was 750 miles.

Mr. Brough, Director of Telegraphs in India, considers that the strongest currents required to work a telephone would not exceed one-millionth of the unit of current employed to work telegraph instruments.

In India, the Oriental Telephone Company has arranged terms with the government for the introduction of telephone exchanges into the three Presidencies, and now only awaits the issue of licenses, which are nearly ready.

The experiments of Professor Pierce, of Boston; Brough, of India, and Warren de la Rue, of England, show that electrical pulsations equivalent in force to one cell of Daniells' battery, charging 6,200,000 miles of telegraphic line, produced sounds in a telephone.

Prof. P. G. Tait calculates the pulsations produced by sounds when employed to change the resistance of a telegraph circuit will produce a corresponding sound in a telephone, provided the change in resistance amounts to one-thousand millionth of the whole circuit.

Now that Russia has put galvanic batteries,

induction coils and insulated wires into the list of suspicious articles of import, it is not surprising to learn that the St. Petersburg police are tapping the telephones throughout the city, so as to be able to hear what the people say about the Czar.

Among the exhibits at the Paris Electrical Exhibition is a machine for hatching chickens by electricity. It has heretofore been observed that machine-hatched chickens suffer from lonesomeness, and do not eat so well as those who hear a mother's constant voice; and so some ingenious electrician has constructed a telephone which will convey to his henless chicks, scattered in different cages about a meadow, the clucking of a central hen.

An interesting telephone experiment may be made by introducing into the circuit one or more persons holding each other by the hands. Conversation can be carried on distinctly through six or more human bodies in this manner. The same principle works admirably on the switch-board, for testing or telling parties connected to "go ahead," by placing the thumb and finger as a connector from either switch to your telephone connection. In other words, using your fingers as a "plug" or "cord." Try it.

M. Alexandre Dumas has discovered that the telephone can be made rather too useful as the conveyance of a practical joke. The other evening at a well-known Paris restaurant, a merry friend asked to be put in communication with M. Dumas, and a few minutes later a squeaky voice replied from the Avenue de Villiers "M. Dumas has gone to bed. Anything important?" "Most important," was the response. M. Dumas was soon at his post with his ear to the telephone, and received the query. "How do you like tripe à la mode de Caen?" It is much to be doubted whether Dumas had any high opinion of the advantages of scientific progress just then.

Referring to our recent article on Telephone Transmitter Batteries, a Baltimore correspondent calls attention to the "Kreis Patent Carbon non-Corrovable Connection Battery." In this battery, he says, the carbons are fastened to a non-conducting incorrodable interposing plate, around which passes a platinum strip, which forms the connector; both plate and strip perforate the glass cover, and are securely fastened thereto, while the platinum strip is carried to and beneath a brass binding post, to which the conducting wire is attached. The negative pole is similarly connected. He adds that the battery is noted for its economy, cleanliness, longevity, and particularly its non-corrodable connections and special adaptability to telephonic purposes, which have secured for it the commendation of many gentlemen prominent in the profession.

A dispatch from Quincy, Mass., on the 3d inst., says: "About 75 citizens assembled in the Lyceum room this evening to consider the advisability of building a telephone line to this town to connect with the Boston system. Hon. Charles Marsh was chosen chairman and W. W. Adams secretary. Supt. Lytle, of the Telephone Dispatch Company of Boston, was present by invitation, and answered the many questions propounded by the gentlemen present. He stated that, for a guarantee of \$400, a line would be built and a public office established in some convenient and central locality. He expressed his opinion that from such a beginning a general telephone exchange system would be quickly developed. A committee was appointed to secure subscriptions to the amount required, it being understood that subscribers are to be entitled to take out the amount of their several subscriptions in using the line at the rate of 20 cents for each Boston connection.

A new patented solution called the Serson battery fluid is now being placed on the market to compete with sal ammoniac, generally used for all open circuit batteries. The new liquid is owned and controlled by the Worcester Individual Call and Signal Company, who claim that it will retain its full strength without attention for from 12 to 18 months, and that it is 50 per cent. stronger than either the Law, Prism or Leclanche batteries, and can be used in any of the above cells. Several of the leading telephone manufactories and exchanges of this city have been furnished with the solution for test purposes, and the action of the new fluid on old, condemned, porous cells is quite astonishing. The Serson battery fluid has the indorsement of

the best known electricians of Boston for superiority as to strength, durability and cheapness. There are at present three agents in this city, namely, Mr. Wheeler, of Worcester, Mass., who is to represent the company South; Mr. Mark Lewis, of Boston, who starts for the West, and Mr. O. J. Neff, of Boston, who will look after the interests of the company in the East and in Canada.

Mr. J. M. Crowley, Superintendent of the Southern Bell Telephone Co., Augusta, Ga., and formerly manager of the W. U. Tel. office in that city, has recently patented a new system of duplicate telephone wires, improved by the addition of a simple contrivance, which promises to supplant the magneto system now used. By the improved plan, the wires are made practically duplex, so that subscribers can talk on the same circuit, if necessary, without the aid of the central office operator, and two or more signal stations may be operated on the same circuit. By simply tapping a small key at any station, subscribers may secure immediate communication with any desired spot, and by the duplexing of the wires their number is very largely reduced, and an objectionable feature very appreciably remedied. Further than this, the new system abolishes the old magneto crank and other awkward and delaying appliances and greatly simplifies the machinery of communication, while rendering it also possible to reduce the expense of operating the apparatus. The improved system was tried recently at stations in Augusta, Ga., and in Richmond, Va., and it was found that subscribers were able to signal and talk with each other without difficulty over the same circuit, thus apparently demonstrating the entire practicability of the improvement.

M. de Arsouval, in a paper read before the Academie des Sciences in April, 1878, describes the exquisite sensitiveness of the telephone. Heretofore the most delicate instrument for detecting and measuring electrical currents was the galvanometer; but a physiological effect was possible by the use of a frog's leg, which would show more slight effects than that of the most delicately adjusted galvanometers with 30,000 turns of wire. In the experiments by M. de Arsouval a frog was prepared after the manner of Galvani's experiment, and an induction apparatus connected to the sciatic nerve, which became agitated by the rapidly succeeding pulsations caused to flow along the nerve. He withdrew the induction coil from the primary until the nerve ceased to respond on account of the feeble character of the electric pulsations, but a telephone which was in circuit with the nerve continued to vibrate. In the stillness of night the vibrations could be distinctly heard in the telephone when the induction coil was at a distance fifteen times greater than the minimum at which the excitement of the nerve took place. As the law of inverse squares applied to induction and distance it is evident that the sensitiveness of the telephone is two hundred times greater than that of the frog-leg galvanoscope, which in turn is by far more sensitive than the most perfect galvanometer. M. Demorest, in order to estimate the force of induced currents, which act to produce sound in a telephone, employed a battery current which would deflect a sensitive galvanometer less than two degrees.

## DASHES HERE AND THERE.

A not upright and plumb young man;  
A not very cheap young man;  
A soapy and lathery,  
Slippery, blathery,  
Two-fifty dollars young man.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—*Adv.*

In reply to a correspondent we would say that the telephone does not seem to interfere much with telegraph business. The latter is growing so rapidly that any possible effect the introduction of the telephone might have upon it is not perceptible.

Charles Brush is said to have invented a new style of storing electricity. He uses metal plates that can store large quantities of the fluid and retain it a long time. With this invention people can make their own electric lights and run street cars and machinery,

"Here I've been calling you for the past forty minutes, and if you don't answer more promptly there will be trouble." "Please call again," she naively replied, "I am always glad to see you." And he couldn't say her nay. Thus a gentle answer turneth away wrath.

Last year the German wire mills supplied England with 30,000 tons of wire and Russia with 40,000 tons. France received from Germany from 12,000 to 15,000 tons of steel wire for sofa springs, and America not less than 30,000 tons from the same source.

The Telegraphic "Artist" still flourishes, as witness the following cablegram to the Associated Press, dated London, Nov. 11: The six passengers who embarked at Gibraltar on the steamer Calliope, which was afterward wrecked on the Spanish coast, were Armenians, not Americans.

An Illinois Central correspondent at Waterloo, Iowa, complains that some of the operators on his line delay business by "fighting circuit." A "23" message asking for a doctor had recently to wait fifteen minutes on this account. There are several other circuits where a change in this respect would be beneficial.

QUICK AND VALUABLE. — The Manager of the Western Union Telegraph at Morrisonville, Ill., writes that "after using Farnham's Armaline two days he was greatly benefited." Send for circular to Brown, Pettibone & Kelly, Stationers, 194 and 196 Dearborn street, Chicago, Ill.—*Adv.*

A well-known telegrapher writes under date of Nov. 2 as follows: "Supt. —, in a note just received, says he is 'delighted' with your Nov. 1 issue. I have been to a good many places this week, and nearly everywhere I see THE OPERATOR, or hear it spoken well of. At Washington, Baltimore, points in Western Maryland, West Virginia and here, it's all the same."

One hundred and fifty men are engaged in digging a trench for the new American Atlantic cable from the beach to the cable house at Canso, a distance of seven miles, two miles of which is solid ledge. The trench is three feet deep and is to contain four cables, and considering the blasting required is a most difficult undertaking. It is expected that the work will be completed by December.

Mr. Hosmer, of the Canada Mutual Telegraph Company, says that the first line of that company that will be worked will connect Montreal with New York. He is very sanguine as to the financial success of the scheme, and says that he is daily in receipt of letters from all parts of Canada urging them to build lines in all directions, coupled with offers of subsidies. Mr. Hosmer adds that \$100,000 will be spent this fall in erecting lines.

The *Electrician* says: On the occasion of the recent visit of Mr. Gladstone to Leeds the resources of the Leeds telegraph department were heavily taxed. On the first day 447,274 words were transmitted, and on the second day 207,279, or a total of 654,553 words. These were all sent from one office. To meet the extra work fifteen extra Wheatstone automatic instruments were brought into use. The weather was very unfavorable, being rainy, so that the telegraph staff of Leeds may be congratulated on the result of their work.

A cable dispatch dated London, Nov. 2, says: "The cable steamer Faraday is now at Gravesend. The officials of the American Telegraph and Cable Company say she will sail again during next week. She will endeavor to repair the first cable, and then proceed to Nova Scotia to commence laying the shore end and intermediate section of the second cable. The interruption in the first cable is, roughly speaking, over 1,000 miles from the British shore, and its cause is not known. About 1,700 miles of the second cable have been laid."

A later dispatch from London says that the Faraday passed the Isle of Wight Nov 14, going westward.

Austin McLane, of New Haven, while working on the top of a high telegraph pole in Meriden, Conn., on the 5th inst., was suddenly taken with a fit, and reaching out helplessly in the air fell over backward. His fellow workmen on the ground cried out in horror, expecting to see him impaled on a sharp picket fence directly under him, but as he fell across the lowest cross-arm of the pole his leg caught between an insulator pin

and the pole, just above the ankle, and held him firmly. He was suspended there over five minutes, hanging head down, before two men could climb the pole and lower him by a rope to the ground.

In order to get telegraph news that can be read, it will be necessary for publishers to give something toward paying the salary of operators who understand their business. The dispatches are received in such a manner as to make them almost worthless. We have concluded to say to the poor Western Union Telegraph Company that we will pay an extra five dollars a week in order to get decent dispatches. By so doing we hope that besides getting a report that we can read, we will get it in decent time. It takes from two to three hours now to get a dispatch from St. Louis.—*Topeka (Kan.) Commonwealth.*

At Manchester, England, last autumn, a class was formed in electricity and magnetism, in connection with the Science and Art Department, consisting chiefly of employes at the central office, York street. The *Guardian*, of that city, says that while the telegraph clerks of the country are seeking higher remuneration for their services, it is satisfactory to note that, in this district, the clerks, female as well as male, are exerting themselves to acquire a competent knowledge of the scientific theories relating to their occupation, and so, to this extent, deserving a higher place.

In connection with our publication at this time of Wordsworth's poems, it will not be amiss to repeat a story about Dr. Bradley, who has just been made Dean of Westminster. The story runs thus: Many years ago, while staying in Westmoreland with the Arnolds, it fell to his lot on a certain day when a picnic was to be held to remain at home and mind the house. When the party returned he was asked if all had gone well, and replied that it was a very fortunate thing some one remained behind, for a tramp had tried his best to get in through the drawing-room window, and would have done so had he not been prevented. It turned out that the "tramp" was the poet Wordsworth.

A dispatch from Ottawa says that the American, Canadian, European and Asiatic Cable Company, which was chartered during the last session of Parliament, has completed its organization. It is said that the company will lay their cables next year, and during the present winter will make arrangements for the construction of land lines from Halifax to Victoria, B. C. The scheme is to lay two cables between England and some point in Nova Scotia, connecting with land lines across the Continent to Victoria (using the Canadian Pacific Railroad lines from Lake Superior westward) and to lay a cable from Victoria via the Aleutian Islands to China, Japan and India.

The Island of Penang lies off the west coast of Malacca, from which it is separated by the straits of that name. A merchant of Penang recently found it necessary to send a message to Singapore just when the cable which crosses the straits had been broken by a storm. The message was, however, bound to go. So it was sent westward instead of eastward, from Penang to Madras, Bombay, Aden, Alexandria, Malta, Marseilles, Paris, Calais, Fano, Riga, Vladivostok, Hong Kong and Saigon, and so having made the circuit of Southern Asia, Europe, Northern Asia and China, came to Singapore. It was delivered, read, and an answer sent back by the same roundabout route reached the sender in Penang in thirty-six hours, the message costing him eleven shillings a word. A message sent by way of Europe from New York to South America would cost nearly as many dollars a word.

Speaking of the "aggrieved telegraphists," the *Electrician*, of London, says: During the present week several of the larger telegraph establishments, including that of the London Central Office, have received their promotions under the revised scheme. As was to be expected, the apportioning of good things has not given entire satisfaction in every case; but, on the whole, there is reason to believe that the prevailing discontent has now been appeased. The promotions date back from April, and overtime performed since the 1st of June is to be paid for under the new system. The senior officers have not been overlooked, but compared with the rewards given to their importunate subordinates, the im-

improvements in the higher grades are insignificant. This is said to be notably the case in respect to the female officers.

A patent has recently been taken out for a means of steering a ship by electricity. The apparatus is the invention of Mr. W. F. King, an Edinburgh electrician, and was recently tried on board a steamer sailing between Glasgow and London. Its object is to dispense with a helmsman, and make the compass itself steer the ship. For this purpose the compass card is fitted with an index which is set to the true course, and one degree on either side of the true course two metal contact pins are adjusted; each pin is connected to a single Daniell cell, and when the ship deviates as much as a degree from her course to one side or the other the index comes into contact with one or other metal pin. The result is that a positive or negative current flows and actuates a hydraulic apparatus which works the helm.

A dispatch from Omaha, Neb., says that J. Hinckley, station agent of the Union Pacific Railroad, at Franklin, Utah, on the Utah and Northern branch of the road, has been murdered in cold blood. Two masked men, presumed to be strangers, entered the depot, and pointing revolvers at Hinckley's head ordered him to throw up his hands. Before Hinckley could make a move a revolver was discharged, and the shot passed through his neck, killing him almost instantly. The murderers, whose object is supposed to have been robbery of the station, turned and ran, from which it is concluded that the discharge of the revolver was unintentional. General Superintendent Clark, of the Union Pacific Railway, has been authorized to offer \$1,000 reward for the arrest and conviction of the murderers.

The practice of the Jersey City boys of climbing telegraph poles by means of an ingenious contrivance made of a piece of wire has become so common that the police have been instructed to put a stop to it. Who invented the idea of using a piece of wire as a means of ascending a telegraph pole nobody seems to know, but it is claimed that the inventor was a Jersey City boy. A piece of wire about four feet long is made into a running loop around the pole, leaving about a foot and a half of each end of the wire hanging down. These ends are fastened about the right foot of the boy. When the foot is raised in going up the pole, the wire is carried upward. A slight pressure with the foot on the wire draws it tight about the pole so that it cannot slip down. After the boy has gone up as high as he dares, he grasps the pole in his arms, lifts his foot, thus loosening the wire, and slides easily to the ground.

On May 31 a sealed packet was deposited in the care of the Secretary of the Academy of Sciences, Paris, by M. Mercadier, who said it contained a description of an application of radiophony to telegraphy. The inclosed paper was read on Oct. 3. The following is the abstract: "A continuous current traverses a series of radiophonic selenium receivers at station A, then the line, then another series at station B. Before each receiver a wheel with a circle of holes rotates regularly, and the passage of the light rays is blocked at will with a Morse key, giving interruptions of the musical notes in the telephones corresponding to the Morse signals. The wheels are arranged to give different notes, and each listener with a telephone concentrates his attention on a particular note. It is said that this system of Mercadier's is capable of being applied to lines of great length."

The Boston Herald, of October 30, says: The branch office of the Western Union Telegraph Company, which has held forth at the Old State House for upward of a quarter of a century, has finally been forced to yield its time-honored quarters. All the paraphernalia of the office was moved across to 31 State street last evening, a locality which has been famous as a telegraph office for over 30 years. The operating room of the newly consolidated offices will occupy most of the second floor, and on the ground floor there will be an ample receiving counter. Direct wires, quadruplex and duplex, will be worked from this point to New York, and all the principal cities and towns in New England will also be in direct communication. James Roche, Jr., has been appointed manager of the office, and John McGrath, formerly

cashier in the Old State House office, will occupy the same position in the new quarters.

Some interesting details of the telegraph in Japan have just been made public here. In that country the telegraph system was begun in 1871, and in 1872 the 900 miles of the principal trunk line were opened. At the end of 1879 there were 3,929 miles of poles and 9,345 of wires. The total number of dispatches sent in 1879 was 1,272,756, of which above 96 per cent. were in Japanese; the international messages were 22,695. The telegrams in the vernacular average one to every thirty inhabitants, on the basis of the latest census figures of population, 35,750,000. The receipts for 1879 were \$541,615; the total expenditures, new construction excepted, were \$508,370, and there was a resulting balance of profit for the first time, the tariff for native messages having originally been put too low. The Japanese language having no regular alphabet, a combination of Morse characters was devised, 47 characters in all, and this "native alphabet" has worked fairly for nine years. The average charge for 20 characters of it, for about 60 miles, is, approximately, 3 sen, or less than 2 cents.

An agreement left with Register Docharty for record shows that the Western Union Telegraph Company has secured a ninety-nine years' lease of the lines of the Northwestern Telegraph Co. of Wisconsin, operated in the States and Territories and the Dominion of Canada. The instrument is dated May 7, 1881, and provides that the Western Union Company shall, in addition to paying 7 per cent. interest on first mortgage bonds, aggregating \$1,180,000, pay a rental of \$100,000 for the first year, and a pro rata yearly increase in the rent until it shall reach \$150,000 by the year ending July, 1896, and thereafter pay the last mentioned sum annually until the expiration of the 99 years; also all taxes and interest upon the capital stock of the Northwestern Company, which is fixed at \$2,500,000, divided into fifty dollar shares. The interest to be paid on the stock is to be 4 per cent. the first year,  $4\frac{1}{4}$  for the second, and be increased at the rate of one-eighth of 1 per cent. each succeeding year until it reaches 6 per cent. in 1896, and to continue at that rate during the remainder of the term of the contract. The Northwestern Company agrees to maintain its organization, and the Western Union grants a further allowance of \$2,500 per annum for 14 years for that purpose.

## NEW YORK CITY ITEMS.

### Echoes From 195.

It is said that Mr. W. J. Dealy is to be the new manager at 195.

Mr. Weller denies that he has engaged Jack Stephenson as chief operator for the Mutual Union at Jersey City.

Miss Dailey, city line chief, is making many friends by the kind and thoughtful attention she shows the gentlemen who work in her department.

Mr. Tom Eagan, "one of the boys from home," has been summering at Nahant. He returns to the office greatly improved in appearance.

Mr. Martin Durivan breaks the hearts of all the fair damsels in the office. Martin parts his hair in the middle and cultivates aristocratic airs.

The aspect of things at 195 is becoming quite merry hued, especially among those who have had their salaries increased.

Mr. F. W. Jones, who recently returned from a trip through the South, has been confined to his room ever since by a severe illness. We are glad to say, however, that he is now recovering.

The distinguished scientist and electrician, Col. Weller, still continues to rotate, the observed of all observers. The philosophic gentleman has lately favored the denizens of Rutherford Park with a lecture on æsthetical culture.

Mr. Voyer and Mr. Barratt are warm admirers of the new tenor, Provost. Mr. Voyer recently sang "Di quella Pira," from "Il Trovatore," and fairly carried West Hoboken by storm with his high chest "C."

Among the operators who have left to cast their fortunes with the Mutual Union are Al. Wright, Fred. Wilcox, and Messrs. Flood, Cherrie, Holbrook and Flint. Quite a number propose leaving on the 1st.

Mr. W. L. Ives has been presented with an Encyclopedia of Poetry. The fly leaf bears the inscription: "Presented to Mr. W. L. Ives by his friends on wire 51 East, as a slight token of their regard and appreciation of his uniform and courteous treatment during their brief but pleasant official connection."

Mr. Thomas J. Landy, who has been 20 years or more in the service, has received his official appointment as Assistant Chief Operator of the Southern Division. The marked improvement in the handling of Southern way business of late stamps him as a man of executive ability and sound judgment.

Mr. A. S. Brown has resigned his position as District Superintendent of the W. U., and has received the appointment of General Superintendent of the Mutual Union Eastern Division. The intelligence of Mr. Brown's advancement was received with marked expressions of approval in the Western Union operating room.

Speaking of the medal awarded at Paris to Mr. George Cumming, of 195, the Cincinnati Gazette says: Mr. Cumming is a telegrapher of experience, and his invention is intended to obviate many of the disadvantages of the ordinary keys. His key is not merely a mechanical invention, but is a solution of an electrical problem which will hereafter be known as the "Cumming theory."

### Other City Items.

Mr. Sheldon, formerly train dispatcher at Sea Beach Palace, Coney Island, is assisting Mr. A. S. Downer in opening city offices for the Mutual Union Company.

In reply to a correspondent we would say that the company which bought the territory of the Metropolitan T. & T. Co. outside of New York is known as the Metropolitan District T. & T. Co. The officers are: President, W. H. Wolverton; Secretary, H. G. Pearson; Treasurer, A. S. Dodd; Auditor, W. O. Whitcomb; General Manager, George L. Phillips; General Agent L. I. Division, L. B. Harris; Board of Managers, Messrs. Wolverton, Theo. N. Vail, Jno. Harrison, Phillips, Pearson and Dodd.

In the Continental office, 30 Broad street, recently, a sharp snap was heard, followed instantly by a quivering mass of blue flame playing around the switch-board, which, by the way, is about the size of a sheet of note paper. For a moment consternation reigned among the operators. The cause was probably contact of one of the wires with the wires of the Brush electric light. There are some, though, who assert that the bolt came by supernatural means, and was hurled at the wretch who transformed "Milwaukee" into "70 Waukeee."

On Thursday, the 3d inst. the men employed by the Met. T. & T. Co., who work under the direction of Supervisor Vermilyea, waited upon that gentleman at his residence in Oxford street, Brooklyn, for the purpose of presenting him with a gold watch and chain. Foreman T. Green, who acted as spokesman, in making the presentation, said that it was but a small token of their respect for Mr. Vermilyea, and of their high appreciation of his worth as an officer of the company by whom they were employed.

The next meeting of the New York Electrical Society will be held at No. 64 Madison avenue, on Wednesday evening, Nov. 16, 1881, at 8 P. M. Mr. Charles S. H. Small will read a paper on the Novelties of the Paris Electrical Congress. By reason of the great difficulty of securing a suitable meeting room, the night of meeting has been temporarily changed from Thursday to Wednesday. Those members in arrears, especially those whose addresses are unknown to the secretary, are requested to forward him their dues or state whether they desire to continue their membership.

J. W. MORELAND, Secretary,  
195 Broadway, New York.

The Fire Commissioners apprehend danger from the electric light wires which are stretching over so much of the city. On Monday the woodwork over the entrance of the Germania Theatre was fired by contact with the naked wire, permitted by a break in the insulator. Lead over the wood was melted by the electric current. The lights whose wire did this damage belong to the theatre, and are not connected with the public lighting of the street. On Tuesday last an imperfectly insulated electric wire lighting pri-

vate premises came in contact with a fire telegraph wire in William street, and the current rushed into the signal box near Chambers street and quite demolished it. If the insulation is thus imperfect while new, constant repetition of such accidents when it becomes old and worn out is, the fire officials say, to be feared. The electric wires, however, chiefly trouble the department when they have to be cut away from the tops of houses to permit the firemen to work at fires. They have to be cut with an instrument having a wooden handle. If the handle is wet it becomes a conductor, and the fireman holding it stands in danger of receiving a fatal shock. That no fatal accident of the sort has happened as yet is due to the great care which is exercised by the firemen, and which, sooner or later, in an exciting emergency will not be exercised.

## PERSONAL.

Mr. H. J. Hendricks is manager of the W. U. Telegraph Office and Telephone Exchange at Albion N. Y.

Mr. W. Price, of Petittcodiac, N. B., and Mr. C. Byrne, of Fredericton, N. B., are working in the cable office, North Sydney.

Mr. C. W. Ward, of Marshalltown, Ia., has accepted a position with the Mutual Union in Chicago, on construction work.

Mr. F. M. Kiger, formerly of Red Bud, Ill., has been appointed agent for the Cairo & St. Louis Railroad at Murphysboro, Ill.

Mr. L. C. Stebbins, late train dispatcher for the Illinois Midland Railroad at Charleston, Ill., fills the position of agent at Red Bud.

Mr. Herbert Brickett, W. U. delivery clerk, Portland, Me., was married Oct. 25 to Miss Annie Castell, of that city.

Mr. J. A. MacCrellish recently collected at the Western Union office, Trenton, N. J., \$103 for the relief of the Michigan sufferers.

Charles H. Billings, of the Cincinnati W. U. office, has "resigned," owing to his furnishing copies of dispatches to others than those to whom they were addressed.

D. H. Ogden, Superintendent of the Hawkeye Telephone Co., Cedar Rapids, Iowa, was in New York last week and gave THE OPERATOR office a call.

John M. Hogan, a messenger in the San Jose (Cal.) A. D. T. office, was accidentally shot and killed, Oct. 26, by a fellow-messenger named Stephen Espinosa.

Mr. E. L. Taylor, formerly night operator at dispatcher's and train master's office, N. C. R. R., Sunbury, Pa., has accepted a day position with the C., St. P., M. & O. Ry. at Windom, Minn.

Mr. Raymond, of Atchison, Kan., has resigned to accept a position with the W. U., at his home in New London, Conn.; Mr. Sholes, of the same office is taking night report at Kansas City. Miss Mollie Taggart is a recent addition to the Atchison office.

J. G. von Chauvin, who was managing director of the Direct Cable Co. previous to its capture by the cable wreckers, and for some time representative in America of the French Cable Co., is now representative in England of the American Telegraph and Cable Co., at 211 and 214 Gresham House, Old Broad street, London.

A Cheyenne, Wyoming, correspondent says that \$62.50 a month is the lowest salaries the U. P. R. R. have paid night operators. This has recently been increased to \$65. Day men receive from \$65 all the way to \$90, \$75 being the average. The lowest paid dispatchers is \$120 a month.

A handsome gold watch, chain and locket, valued at \$300, were presented by Mayor Mackintosh, Nov. 3, to Mr. Warren Y. Soper, on behalf of the citizens of Ottawa, Ont., as a token of respect and esteem on his retirement from the management of the Dominion Telegraph office in that city. Mr. Soper is now superintendent of the Canada Mutual Telegraph Company.

The Providence Journal of Oct. 29, says: "Mr. A. L. Suesman, who has been identified with the Western Union Telegraph Company in this city for the last seventeen years, has been appointed manager of the American Rapid Tele-

graph Company's office in the Merchants' Bank Building, and will enter upon the duties of his new position at once. Mr. Suesman is an accomplished electrician and an affable gentleman, and will make friends wherever he may be."

BURLINGTON, Vt.—Our branch office has been closed, the operator, Miss Zealand, going home to Canada. Our day man, Mr. C. W. Learned, has left for parts unknown. Mr. George Cheny takes his place. Our night man, Mr. Stewart, goes away this month to Canada, his home, to spend a short vacation. He is not expected back again. Mr. James McDermott, of Saratoga, takes his place. The Mutual Union is pushing things this way. They expected to open next month; they have a large gang of men at work.

The following changes have recently taken place at St. Louis: Mr. James A. Murray has been appointed manager of the "gold and stock" department, vice Dougherty, resigned. Mr. Geo. McGann, formerly assistant chief operator A. U., and since the consolidation holding a similar position with the W. U., has resigned to accept a more lucrative position with the M. U. as chief operator. His successor is Mr. E. L. Parmelee, formerly all-night chief, and Mr. Jas. H. Gallagher has been promoted to the all-night chiefship, vice Parmelee.

Among the subscriptions to THE OPERATOR received last week was that of Mr. V. V. Bullock, father of ex-Gov. Bullock, of Georgia. Mr. Bullock is probably the oldest telegrapher on any newspaper subscription list. He opened the first office in Albion, N. Y., in 1850, for the House Company, and it was there that ex-Governor Bullock was initiated into the mysteries of the business, in which he still finds time to take as lively an interest as does his father. The old gentleman is now seventy-five years of age. His hair is as white as snow, but his step is as buoyant as a young man of twenty. His mind, too, is as clear as a bell, and his memory wonderful. He relates the stirring events of the olden time, the hard-fought contests of the opposition, as though they occurred but yesterday.

WASHINGTON, D. C.—Mr. E. L. Bugbee, formerly manager of the American Union, and Baltimore & Ohio Telegraph Companies here, has resigned that position to accept one of responsibility in the Western Union office. He bears with him the best wishes of a host of friends for the success he is sure to attain in his new position. Mr. G. H. Taggard, late Washington manager of the A. & P., succeeds Mr. Bugbee temporarily. It is understood that the main office and also the branch offices are to be continued as B. & O. offices. The Mutual Union Co. are fitting up a main office opposite the Western Union Co., cor. Fifteenth and F streets, and will also open branch offices. Mr. J. J. Grant, of Cincinnati, has been appointed Mutual Union manager.

ROME, Ga.—J. E. Rolston, of the S., R. & D. here, has accepted a position with the W. U. in Chattanooga. D. C. Sims, of the same road, has gone to Mobile. Charles Woodruff, formerly counter clerk in this office, has been appointed operator at Gadsden, Ala. S. B. Watson, of Talladega, succeeds him. The Misses Noble and Carnochan still work the city wire, with a new addition, Miss Florence Young. V. G. Shearer, of Talladega, has accepted a position at Meridian, Miss., with the W. U. T. J. Flemming, of Rome, is his successor. The Telephone Exchange, which has been so long looked for, has at last put in an appearance. Nearly all the merchants here are subscribers, and the future of the telephone seems promising. The central station will be in the office of the W. U., managed by Mr. W. H. Adkins.

Speaking of the electric light men at Paris, the London Truth of October 20 says: There was no humility in the mien of the American inventors present. They were free and independent citizens of the United States. Hiram Maxim, who comes from the pinewood State of Maine, has a head expressive of originality of mind and of audacity of carrying out ideas. He has a shock head of iron-gray hair. Jablochkoff is a Pole, and all and young. His strength seems to have all gone into hair and beard. Siemens is a patient savant, but not an humble one. Unobservant would be the person who could fail to perceive in him a millionaire, although he is not puffed up by his prosperity. Swan is the North of

England man, doggedly persevering, independent, seeing his way clearly and without conceit.

The London staff of the American Cable and Telegraph Company is composed of Messrs. H. E. Robson, Manager; Mr. J. Ball, from the French Co., New York; Messrs. Bacon, McLachlan, Garbutt and Hitch, from the French Co., London; J. W. Wilson, French, Brest; Messrs. Williams and Butt, Anglo, London; Messrs. Parsons, Bowes and Smith, Direct, London, and Mr. W. F. Ward, formerly of the first French cable company, latterly of the Brazilian and Submarine. The Penzance staff is composed of Mr. G. R. Mockridge, from the Direct Co., Boston, Mass., Manager; Messrs. Taylor, Wood, Brock, Chambers, Giles and O'Donoghue, Direct, Ballinskelligs; Messrs. Motton and Marshall, French, London; Mr. Potts, Anglo, London; Messrs. Loughran and Loam, who have recently returned from the East, and Mr. T. T. Eckert, Jr., from New York.

GALVESTON, Texas.—DEAR SIR: The increase in salaries expected for several weeks past has not as yet put in an appearance, although it was faithfully promised to take effect from Oct. 1. Our day force consists of Mr. Skinner as Chief; Messrs. Church and Kinsey manipulate the New Orleans duplex; Whittaker, West Texas; Taylor, North Texas; McLean, Houston; Smith, St. Louis; Otto, Shreveport wire; Mr. Fox at the Cotton Exchange. Night force consists of Mr. Maer, as chief, Moore, press man; Larcombe, North Texas; Dougherty, West Texas; Holmes, Houston; Gardner, New Orleans. The day force is working extra to fill in the night force. The Santa Fe Company also does a good business here: Mr. Newton, as Chief Train Dispatcher; Messrs. Clark, Campbell and Russell as Assistant Dispatchers, Mr. Graham in charge of the commercial department, the latter two being old W. U. men. At a call meeting of the Brotherhood of Telegraphers held here Nov. 6, sixteen members were enrolled. As soon as our charter can be received and a permanent organization made, we will have at least twenty-five members.

## LONE STAR.

Arizona newspapers speak in high terms of praise of the intrepid action of Robert C. Lord, a corporal in the signal service corps, who, in the midst of the Apache outbreak, went out to repair the telegraph line between Fort Grant and Camp Thomas after it had been cut by the Indians. It seems that, a few weeks ago, about 10 A. M., the line went down between Fort Grant and Camp Thomas, and Corporal Lord ordered his repairmen, A. F. Liedercranz and J. F. Vandell, both soldiers, to proceed to repair; the commanding officer furnished an escort of two men and the party of four left about noon. Vandell was something of an operator, and took the field instrument with him, Lord heard from him by wire about 2 P. M., and the trouble being farther on, they reported that they would communicate again in half an hour. This was the last heard of them, and, as near as can be ascertained they were killed about a mile from the place they telegraphed from. About 6 P. M. news arrived by courier that the troops were fighting the Indians 12 miles distant, and that the repair party were all killed. After the troops came in, Corporal Lord insisted on going out to repair the line, as it was much needed, and, recognizing that one man was as safe as a few (all that could have gone with him) he insisted on going alone. They, however, forced one man on him, whom he seems rather to have looked upon as an incumbrance. He got away at daylight, rapidly moved over the country and repaired six breaks. The Indians, however, cut the wire again behind him. Corporal Lord reached Cedar Springs stage station, a distance of 22 miles, at 1 P. M. The next morning he returned, found where they had cut it again, and repaired it, establishing the communication, and got back to camp safely. This is what may be termed telegraphing under difficulties, and reflects great credit upon the profession, as well as upon Corporal Lord.

## DIED.

LIVERMORE.—Nov. 7, at Portland, Me., Mrs. Hattie Ellis, wife of Charles D. Livermore, manager W. U. Tel. Co., aged 33 years.

# A \$ 40.00 TWENTY-SIX SHOT SPORTING RIFLE FOR ONLY \$15.00

WEIGHT 8½ lbs.

Price \$15.00

POLISHED & ENGRAVED STOCK.

NO. 1.  
SHOOTS ACCURATELY UP TO  
1200 YARDS.

NO. 2.

## THE EVANS TWENTY-SIX SHOT MAGAZINE SPORTING RIFLE. SHOOTS 26 SHOTS IN 60 SECONDS WITHOUT REMOVING FROM THE SHOULDER.

No hammer in the way. Throwing down the guard ejects the shell, loads and cocks. Having sold through our advertisement of a month ago over 2000 Rifles, we now offer the balance of 1500 for \$15 each. **THIS IS POSITIVELY YOUR LAST CHANCE** to get one of these magnificent Rifles. **THE EVANS** is without exception the most accurate, longest ranged, easiest loaded, quickest fired, best constructed and most perfect repeating Rifle in the world. It is 44 Calibre, centre fire, POLISHED AND ENGRAVED BLACK WALNUT STOCK and sighted with graduated sights up to 1200 yards, at which distance it is more accurate than any Rifle in the world. The magazine contains 26 shots, and is located in the stock as shown in cut No. 2. The working parts are all steel of the finest quality, case hardened and blued, and for \$2.00 extra or \$17.00 we will send one our full nickel (silver-plated) Rifles, which is without doubt the most elegant in the world. The barrel, and every part except the wood work, being nickel silver plate, looks like silver and can never rust in any climate. Owing to the failure of the **EVANS RIFLE CO.**, who spent over \$200,000 in perfecting this Rifle, we were enabled to purchase their whole stock of over \$50,000 worth of perfect Rifles at one-third the actual cost of manufacture. The price of these Rifles has always been \$40 each, and when this lot is sold they cannot be purchased again at any price. **Order now**, you cannot make a mistake, as you can readily sell it for \$30 to \$40. **TAKE NOTICE**, upon receipt of \$15 we will send one **Evans Twenty-six Shot Sporting Rifle** as above described, carefully boxed, and when full amount of cash comes with the order we will send a box of reloadable metallic cartridges (Evans cartridges can be reloaded many times). Or sent C.O.D., privilege of examination, upon receipt of \$3, or your Express Agent's guarantee that it will be returned to us free of express charges in case you do not take it, but we do not send the cartridges when sent C.O.D., as this is extra inducement to those who send cash with order.

Send Money by P. O. Order or Registered Letter at our risk. Price of Reloading Tools for reloading shells \$4.00, former price \$6.00. **EVANS Cartridges** can be reloaded many times. **Every Rifle guaranteed perfect or money refunded.** **UNSOLICITED TESTIMONIALS!** "The Evans has been my constant companion for two years. I have shot 60 Buffaloes at one run.—Kit Karson, Jr." "I have used the Evans in competition with the Sharp, Winchester, and Ballard, it beats them all."—J. Frank Locke, Huronville, Minn. "It shoots like a house a fire! I can clean out a whole band of Indians alone with it. I shall recommend them wherever I go."—Texas Jack. "It is the Strongest Shooting Gun I ever put to my shoulder, and as for accuracy it can't be beat. I know it to be the best Rifle in the market."—J. A. Boyd, of Yates' Sharp Shooters.

When ordering mention that you want the polished and engraved stock. **TAKE NOTICE.** These targets were made with the Evans shooting off-hand at 200 yards at Creedmoor, Sept. 17th. The whole 26 shots being fired inside of one minute, and without removing the Rifle from the shoulder. Of course much finer shooting could be done by taking time. As to our responsibility we refer to any Mercantile Agency, Express Co. or reputable business house in this city. **CUT THIS ADVERTISEMENT OUT, IT WILL NOT APPEAR AGAIN.** Address **E. G. RIDEOUT & CO.,** 10 Barclay Street, New York.

### DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together the purchaser may deduct

**25 Per Cent.**

from the regular retail price before remitting. The books will then be forwarded, post age or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and **THE OPERATOR** for fifteen months in connection with any one dollar book for \$2.00.

### How Enterprising Operators may Add to their Incomes.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

**W. J. JOHNSTON, Publisher,**  
No. 9 Murray Street, New York.

# J. H. BUNNELL & CO.'S NEW STEEL LEVER SOLID TRUNNION KEY

J. H. BUNNELL & CO.,

112

LIBERTY STREET,

New York.

BEST IN THE  
WORLD.

PATENTED Feb. 15  
1881.

We have much pleasure in being first to make and bring to the notice of Telegraphers and Managers of Telegraphs this new and important improvement in keys.

We offer it as being *more durable* and in every respect *better* than any other for rapid and perfect sending for the following reasons:

The lever is *only one-half the weight* of the ordinary brass lever, as generally made.

The entire Lever and Trunnions together being made of *but one piece* of fine wrought steel, the common defect of loose trunnions is avoided, the strength of a heavy brass lever is obtained with much less weight of metal, and, by the perfect bearing which the solid trunnion gives, together with the use of *hardened platina points*, *sticking is absolutely prevented*.

The size and proportions are such as to make it the most perfect operating key possible to obtain, either for the hand of the skilled and rapid expert, or the beginner.

PRICE, \$3.00. FINELY FINISHED, AND LEVER NICKEL-PLATED.

LIBERAL DISCOUNT ON ORDERS FOR COMPANY SUPPLY.

Steel Lever Key sent by mail post paid, to any part of U. S. or Canada on receipt of the above price, by registered letter or money order.

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

## PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz. :

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the

**LAW TELEGRAPH COMPANY,**

140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager,

MODERN TELEGRAPH SERVICE.

**J. H. BUNNELL & CO.,**

112 Liberty Street, New York.

**A \$6.00 REVOLVER FREE TO YOU.**

**THE WORLD RENOWNED BLUE JACKET**

WEIGHT 7½ OUNCES  
THIS CUT IS 2-3 SIZE.

**THE BLUE JACKET**

is the most elegant Revolver in the world, as well as the most perfect and beautiful in design and finish. It is made of the very best steel. The barrel and frame is Nickel Silver-plated, with Gold-plated Cylinder, Ivory Stock, and the whole beautifully engraved and enameled, making a beautiful contrast of four different colors. The cut represents only two-thirds the actual size, and as it is impossible to show the beautiful contrast of Gold, Silver, Blue and Ivory, it conveys but a slight idea of this handsome weapon. It is simply beautiful beyond description. It is the first IVORY HANDLE, ENAMELED AND ENGRAVED REVOLVER ever sold for less than \$6.00, and is the most remarkable bargain we ever offered in fire-arms. This Revolver cannot be made to-day for twice what we are offering it for, and it will be a long time before we shall be able to offer another such bargain. We have 5,000 only; when these are sold, no more can be had except at regular prices. **THE BLUE JACKET** is as well known as any Revolver in the world, and the new Russian Model Hip Stock exactly fits the hand, enabling you to hold it firmly and steadily. It has a finely rifled barrel, positive stop-action holding the cylinder firmly in place, and uses the extra-long cartridge. With the **BLUE JACKET** you can shoot a squirrel or partridge from the tallest tree. We guarantee its shooting qualities, and if you are not perfectly satisfied with it **WE WILL REFUND THE MONEY EVERY TIME.** We purchased these Revolvers at less than one-fourth their cost, and we wish to give all who read this the benefit, and at the same time introduce our publication **THE HOUSEHOLD GUEST MAGAZINE.** If you will send us \$2.00, and TEN CENTS EXTRA to help pay postage, we will mail the Magazine one year, and the REVOLVER FREE of all other charges. **THE HOUSEHOLD GUEST MAGAZINE** contains 24 quarto pages, with handsome Illustrated Engraved Cover, and is filled with choice Illustrations from all parts of the world. Stories by the best authors; Poetry; Anecdotes; Sketches; Illustrated Fashion Department; useful information; Statistics; Answers to Correspondents; Household Notes; The Kitchen; Ladies' Items; The Toilet Table; The Garden; Wit, Humor, &c. It is now in its fourth year, has a large circulation, and the regular price for a year's subscription has always been \$1.50.

**FREE TO YOU.** If you will cut this advertisement out, show it to your friends, and get a club of seven to join you, and send us \$14.00, with 70 cents extra in stamps to help pay postage, we will send you the Revolver and Magazine free for your trouble. **PLEASE BEAR IN MIND** that each one in the club will also get the Revolver and Magazine, and when full amount \$14.70 is sent with the club order, we will put in a box of cartridges for each Revolver. As to our reliability, we refer to any New York Publishers or Merchants. Send money by Registered Letter or Post Office Order at our risk.

Address, **E. C. RIDEOUT & CO., 10 Barclay Street, N. Y.**

THE TARGET illustrated here was made with the **BLUE JACKET** at 27 yards. Every shot being put in a bull's-eye one inch in diameter. **CUT THIS OUT, IT WILL NOT APPEAR AGAIN.**

## THE DELANY RELAY AND SOUNDER.

RELAY.

SOUNDER.

The above cuts illustrate the Delany Patent Telegraph Relay and Sounder, now being manufactured and tested with a view to their general introduction on all Telegraph Lines liable to be affected by the Page Patent. These instruments are in all respects superior to any now in use.

**The Tonic Extract of Wheat** improves weak digestion, cures sleeplessness, nervousness, constipation, loss of appetite and power. Especially adapted to repair brain waste from study, care or grief. Prevents and cures Bright's disease, diabetes, uterine weaknesses, rheumatism, neuralgia and all malarial diseases. Strengthens to overcome evil habits. Adapted for table use. \$1 each, or six bottles for \$5. Sample bottle 50c.

**The Fibrin and Wheat** restores the confirmed dyspeptic stomach and cures all forms of long standing nervous debility. Vitalizes weakly children and energizes old age. Sure preventive and cure for diphtheria, infantile diarrhoea and cholera infantum. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Beef and Milk** is for a very weak condition, and never fails to assimilate, however weak and irritable the stomach. Invaluable for nursing mothers. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Life Food** is to be taken between meals to relieve sense of "goneness." Never failing remedy for the alcohol, opium and tobacco habit, and for insanity and cancer in their early stages. \$1.50 each, or 6 bottles for \$7.50. Sample bottle 75c.

## A. G. DAY,

MANUFACTURER OF

### Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

### DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

### Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, **SIR WILLIAM THOMSON**, the eminent electrician and scientist, awarded to the

**Kerite Insulated Wire and Cables**

A DIPLOMA FOR

"Excellence of the Insulation and Durability of the Insulator."

For sale by all dealers in Telegraphic Materials.

# PARTRICK & CARTER'S TELEGRAPHIC SPECIALTIES.

## THE "LATTIG" [AUXILIARY LEVER NON-STICKING] KEY.

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very finely finished, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the indorsement of the best operators in the country. It embodies the only true principle to prevent a key from sticking, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of sticking keys. We claim this key will never fail to make contact.

## "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY of BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

## The Giant Sounder Perfected.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

## Champion Lightning Arrester.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

## Premium Learners' Apparatus.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

PARTRICK & CARTER, 114 South Second St., Philadelphia, Pa.

# THE FITCH CHLORINE BATTERY.

PATENTED SEPT. 16, 1879.  
The cheapest, cleanest, most economical, durable and decidedly the

## Best Open-Circuit Battery

in use for Telephones, Annunciators and Electric Bells. After several years of constant use, it is pronounced to-day as being far superior in constancy and power to all other batteries for the above purposes, notwithstanding all statements to the contrary. We have made several valuable improvements in this Battery, among which is the substitution of a non-corrosive and adjustable clamp, in place of the old style lead cap, which warrants us in saying that the Chlorine Battery has no equal in the market, and all we ask is a trial.

Price, \$1.50 per cell.

Liberal Discount to the Trade.

OAKUM PICKINGS.

That agents may be equipped for taking orders at an insignificant cost, we will send all of these books, each bound in cloth, for use as samples, prepaid, on receipt of \$5 (regular price \$8).

"THE OPERATOR" for fifteen months can be added to the above for one dollar extra.

Any of the above works forwarded, **POSTAGE PREPAID**, to any address in the United States, Canada, Mexico, England, France, Australia, or any country in the Universal Postal Union, on receipt of the price. Remit by Post-Office order, draft, registered letter or express.

U. S. Postage stamps taken.

Address,

**W. J. JOHNSTON, Publisher,**

No. 9 Murray Street, New York.

## THE FOLLOWING TABLE OF CONTENTS

will give some idea of the style and scope of our new book,

# TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY,

which is now attracting so much attention

**PRE-ELECTRIC TELEGRAPHS.** Signaling among the ancients—Telephonic system of the African negroes—Signaling by sound in Montenegro—Fire communication in war and otherwise—Dr. Hooke's telegraph—The semaphore—Semaphoric blunder and its result—The word "telegraph"—Prediction quoted by Addison.

**THE ELECTRIC TELEGRAPH—ITS BEGINNING AND DEVELOPMENT.** First lightning-rod man—Frictional electricity discovered—The Leyden jar—Experiments to Franklin's time—His famous kite experiment—Robert Stephenson's boyish imitation—Lomond's electric signals—Lesage's invention of electric telegraph, using twenty-four wires—Reiser's thirty-six wire telegraph—Succeeding experiments to Morse and subsequently to present time.

**INTRODUCTION OF THE ELECTRIC TELEGRAPH IN THE U. S.** First American line—Apathy of scientists, press and public—Why the *Herald* refused to encourage the telegraph—Cornell and Morse—First apparatus—Interesting relic—First week of telegraph—Slender returns—Humors of early-day telegraphy—Countryman, turkeys and telegraph—Mr. Stearns and obstreperous church bell—Honor to whom honor is due—Ronalds—Morse—Henry—Vail—Claim for laborers—"Be jabers, who dug the post holes?"

**A CHAPTER ABOUT OPERATORS AND MESSENGERS.** The operators' view of human nature—Their faithfulness—Their literature—Their difficulties and trials—Epileptic telegrapher—Armless operator—Deaf operator receiving by sound—The "lightning striker's" blunder and a case of jealousy—Recognizing by touch—Love over the wire—Love disappointment in humorous verse—First marriage by telegraph—Absconding operator caught by novice—Wonderful speed in telegraphing—Messenger service—District telegraph boys and the various duties they perform—Anecdotes of them—Uniformed messenger mistaken for policeman.

**THE TELEGRAPH IN WA.** Earliest military signaling—Introduction of field telegraphy—Field telegraphy described—Dangers to apparatus—Firing guns by electricity—Telegraph in civil war—Its great value—What General Sherman said of it—Origin of U. S. Military Telegraph—Cost of service during war—Duties of cipher operators—Official acknowledgment of their services—Anecdotes of military operators' ready wit, heroic courage and nervousness—Funny war story—Another—Military operators' poor quarters—A provident telegrapher—Richmond taken—Receipt of the great news—Lincoln's assassination—Grand feat of Prussian soldier, and heroism of French female operator.

**CABLE TELEGRAPHS.** General—The Atlantic cable—First suggestion of it—Its origin—Organization of company—Laying cable—The Great Eastern—Discouragements—First message—Suggestor wittily silenced by Mr. Field—Cost of first Atlantic cable—Recent improvements in cable laying—Mr. Field's services—Cable operators—Cable codes—A specimen—Its interpretation.

**HUMORS OF THE TELEGRAPH.** Economical Irishman—Timid old lady—Apprehensive Texan—Witty, incongruous and rhyming telegrams—A "killing" blunder—The "additional wurred"—A furious message—Satchel by telegraph—Snubbing a king—A proper old lady—Little "Johnny Russell"—Peter to Margaret Flagarty—He couldn't be fooled—"Sh" writes like a man—Model (?) Maine man—Hollow and "hello"—Fooling savages—"Onnateral fixins"—Chicago and—"Witt" illustration—Electrifying loafers—Shocking the negroes—Blind-folding the "masheen"—A crammer.

**TELEGRAPHIC "BULLS."** A fatal "bull"—Matrimony killed by a "bull"—Instances of operators' "bulls"—A lord's mistake—John Brown and Seaton Bros.—Ale or oil—Too much coffee—Blessings in disguise—A profitable mistake—A military "bull" that was not all a "bull"—Senders' "bulls"—Habit and halibut—"Bulls" from bad spelling—A fishy story—Tragic "bull"—Injustice to operators.

**LIGHTNING FREAKS AND TRAGEDIES.** Deaths from lightning—Effects in different countries—A triple tragedy—Curious freaks of lightning—Some wonderful instances—Lightning in telegraph offices—Operators killed.

**SHARP PRACTICE BY TELEGRAPH.** Abuse of General McClellan's name—A modern "St. John"—Big swindle in Toledo—"Spiritualistic" swindling—Rappers' tricks—Their magnets—How to make them—Sir Charles Wheatstone's experiments—Two good stories of sharp practice by operators—Tampering with cipher message—The bitters bit—Great bank swindle—Barb's telegraphic trap for burglars.

**THE TELEGRAPH AN UNIVERSAL INSTITUTION.** A well-traveled message—Spanish peasants and telegraph—Telegraph in Morocco—China—India—The East in general—Japan—in Africa.

**THE WEATHER REPORTS.** Death of General Meyer—His account of storm signal system—Its value to commerce and agriculture—The New York station—Cipher reports of weather—Difficulties of signal service—Early opposition—Origin of weather reports in the United States—Smithsonian Institution—Professor Henry.

**THE RAILROAD TELEGRAPHIC SYSTEM.** Originated in England—First instance of train dispatching in this country—System at Grand Central depot—Moving trains by telegraphic orders—Official instructions—Train dispatchers and operators—Their responsibility—Thrilling incident—Operator who "forgot"—Noble operator—Latest inventions in railroad signaling—The train telegraph—No more screaming engines—Supplying locomotives with water by electricity—Fun on the railroad—Waking the Pullman porter—Operators' anti-suporific.

**ELECTRICITY AND LIFE.** General remarks—Electric girl of La Perriere—Electrical lady of Nevada City—Electricity on dinner table—Feeling pulse by telegraph—Development of growth by electricity—Uses in surgery and dentistry—Electricity as a healer—An "anti-fat" story.

**OUTGROWTHS OF THE TELEGRAPH.** The electric light—Edison's description—The light at Niagara—Experiments in San Francisco—Proposed illumination of Holyoke—Use in stores, steamships, and in war—The telephone—How constructed—The German name for it—Its invention—Telephone service meter—Transmitting sermons by telephone—First instance—Mr. Beecher's—The telephone in Jersey City law courts—Communicating between ships—Use in wooling—In military operations—Music—Humors of the telephone—The singing telephone—Yarn from Pine Bluff—Joke on reporters—One for Dawdles—Marriage by telephone—Telegraphing by light—The photophone—Electrical egg hatching and seed germination—Theatrical thunder—Toothache cured by electricity—Gas lighting and bell ringing by same means—Electricity as an umbrella—In taming horses—In connection with Moody and Sankey's meetings—Telegraphing by electrical air currents—Maps by telegraph—Magnetic magic writing—Electric driving power—Electricity in managing refractory horses—Engraving by electricity—Diagrams of targets over the wire—Electric combs and brushes—New uses for the sun's rays—The ocean a source of electricity—Suggested use of electricity in executing criminals—Slaughtering cattle and killing whales by electricity—Electric clocks that require no winding—Telegraphing by steam at sea—Electricity in steam—The Edison electric locomotive—Description of it—Electricity aiding weary cash girls—Conclusion.

**Copies promptly mailed, prepaid, on receipt of price \$1**

A CHEAP, SEASONABLE AND ELEGANT WORK!  
CHRISTMAS  
EVERCREENS.

A COLLECTION OF CHOICE

TELEGRAPHIC AND GENERAL POETRY,

SUITABLE FOR A

## HANDSOME HOLIDAY PRESENT.

**Illustrated by a Frontispiece and Fifty Fine Engravings.**

HEAVY TINTED PAPER. CLOTH EXTRA. FULL GILT. PRICE, \$1.50.

**CHRISTMAS EVERGREENS** has been so ENTIRELY RE-ARRANGED, by the addition of much new matter—including a dozen fine cuts and a beautiful frontispiece—that it is now virtually a new book and, the publisher thinks he can safely claim, at least as handsome a volume at the price as has ever been issued by any publisher, American or foreign.

Indeed, an examination will demonstrate that the edition of "Christmas Evergreens" for this year compares very favorably with any of the ordinary three, four, or even five dollar holiday books, either as to contents, illustrations, typographical appearance, paper, printing or binding.

Telegraph & Telephone New Year's Calling Cards,  
1882.

For the last four years we have prepared each year New Year's Cards for telegraphers. Our object has been to give the fraternity a distinctively telegraphic New Year's Card, one that was neat, pretty, appropriate; different from any other New Year's Card, and so unique and handsome as to attract attention and deserve preservation. Our success has been much greater than we could have expected, and this year we have, in addition to those for telegraphers, also one for telephone men.

## PRICE LIST.

25 cards, with one name, mailed to any address on receipt of	\$	35
50 cards, with one name, " " " "		50
25 cards, without name, " " " "		25
125 cards, without name, " " " "		1.00

Cards furnished by the thousand at special rates.

 There will be no delay in filling orders. The cards will be mailed in each case as soon after receipt of the order as it is possible to have the name printed. Order early. U. S. postage stamps taken. Samples of either the Telegraph or Telephone Cards mailed on receipt of 2c. stamp. Samples of New Year's Cards and messengers' addresses on receipt of 3c. stamp.

25 New Year's Cards, with name, or 25 Messenger Addresses, will be mailed *free* to any one sending us two yearly subscriptions for THE OPERATOR. Their own and that of a friend will do.

Telegraph Messengers' Christmas and New Year's  
Greeting, 1881-82.

These addresses can be used either at Christmas or on New Year's day, as the messengers many prefer. They are suitable for the messengers of ANY telegraph company. They are for presentation to patrons of the telegraph, merchants and others; and messengers will find them neater and handsomer than anything of the kind heretofore used for this pupose, and cheaper than they could possibly get them printed for in their own towns.

**PRICE:**

25 Copies, postage prepaid, only	\$0.35
50 Copies, " " "	0.60
100 Copies, " " "	1.00
250 Copies, " " "	2.25
500 Copies, " " "	4.00
1,000 Copies, " " "	7.00

Order early; U. S. postage stamps taken. Samples mailed on receipt of a 2c. postage stamp. Sample of both the Messengers' Address and of the New Year's Cards will be mailed on receipt of a 3c. stamp.

Messengers are recommended to order a supply of our Telegraphers' New Year's Visiting Cards, with their name printed on them, to be presented in connection with the Messengers' Address. We will send 25 addresses and 25 cards on receipt of 60c; 50 addresses and 50 cards on receipt of \$1.00, or 125 addresses and 125 cards on receipt of \$2.00.

Address,

19 CLIFF ST. NEW YORK

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00  
The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75  
The three books, THE OPERATOR one year and The Dictionary, or any other \$1 book..... 3.50  
"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,  
P. O. Box 3,332.

HOW SOME OF OUR BOOKS  
**MAY BE SECURED FREE.**

Although the subscription price of THE OPERATOR is so low that little margin for liberality remains, yet to any one sending us a club of four yearly subscriptions (old or new)—their own and three others will do—we will mail, free and postage prepaid, as a premium, a copy of either "Telegraphic Tales and Telegraphic History," the Dictionary, "Lightning Flashes," "Christmas Evergreens," or "General Grant," bound in cloth, or a copy of THE OPERATOR for one year.

Any two of these book for a club of eight yearly subscriptions; any four for fifteen yearly subscriptions; or the five for eighteen yearly subscriptions.

To any one sending us three yearly subscriptions as above, we will mail a copy of "Oakum Pickings," cloth, "Wired Love," cloth, or "Sam Johnson," paper.

To any one sending us two yearly subscriptions, as above, or their own and that of a friend, we will mail a copy of "Oakum Pickings," bound in strong paper, or a copy of "Telephone and Oshkosh."

All 9 Books for 25 Yearly Subscriptions.

A Silver Watch for 60 Yearly Subscriptions.

A Gold Watch for 160 Yearly Subscriptions.

We are anxious to secure a very large number of agents everywhere, both for THE OPERATOR and for the books we publish. Those in a position to act for us will oblige by making a beginning at once.

Should specimen copies be desired, drop us a postal card and they will be immediately mailed you free.

**A Magnificent Work for a Holiday Present!**

**POEMS OF WILLIAM WORDSWORTH**

Edited, with an Introduction, by Richard Henry Stoddard.

**320 Large Pages, Elaborately Illustrated. Cloth, Gilt Edges, Price \$3.00.**

This is the most pretentious volume we have yet attempted. Every illustration it contains was engraved especially for it, by the foremost of American engravers. There are no fewer than 74 engravings in the book, and they are all large, nearly every one being what might be called full page.

The book is unusually prettily bound, with a profusion of gold on the side and back, and gilt edges. The design for the cover was made especially for it, by an artist whose reputation for such work is national.

For the purpose of securing the proper margin, the paper—which is thick, fine and of a rich cream tint—was also made to order; and throughout no expense was spared to add to the beauty, value and attractiveness of the book.

**This is no Reprint of an English Edition.**

The cuts are all new and the plates made from new type. No such elaborate edition of Wordsworth has ever been published on this side of the Atlantic. Similar works published in England, not any handsomer than this, and, indeed, not so handsome, cost from \$9 to \$12 a copy. The price of the present volume, however, puts it within the reach of every telegrapher wishing to make a holiday present. The book is all ready and orders will be filled as soon as received.

Agents Wanted for the New Book, to whom we will allow liberal commissions. Telegraphers can sell large numbers before the holidays.

'The Operator' for One Year and a Copy of Wordsworth will be Mailed Together, Postage Prepaid, for \$3.50.

"Tales and History," or any of our other \$1.00 Books, at the same Price.

"Tales and History," "Christmas Evergreens" and "Wordsworth," \$4.50.

All ten books we publish (nine cloth; Telephone and Oshkosh, paper), postage prepaid, only \$7.50. THE OPERATOR one year and all ten books for \$8.00.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

# THE GAMEWELL Fire-Alarm Telegraph Company.

EXECUTIVE OFFICES: Nos. 5 and 7 DEY STREET, NEW YORK.

PROPRIETORS OF

THE "OLD AND ONLY RELIABLE"

## AMERICAN FIRE-ALARM TELEGRAPH,

which has been in successful operation for more than a quarter of a century, and has been thoroughly tested and approved by

Over 110 of the Leading Cities in the United States and Canadas.

L. G. TILLOTSON, New York, President and Treasurer.  
JOSEPH KINSEY, Cincinnati, First Vice-President.  
B. S. CLARK, New York, Second Vice-President.  
HENRY L. BRUNS, New York, Secretary.  
JOHN N. GAMEWELL, New York, General Superintendent.

The GAMEWELL FIRE-ALARM TELEGRAPH COMPANY continues to contract with cities and towns for the construction of this

## Invaluable Adjunct of Every Well-Regulated Fire Department.

THIS IS THE ONLY

**PERFECT, COMPLETE AND RELIABLE SYSTEM**  
of Fire-Alarm Telegraph in the World.

### WHAT IS SAID OF THE GAMEWELL SYSTEM.

From a very large number of testimonials on file we select the following, as sufficiently evidencing the high estimation in which the American fire-alarm telegraph is held by those who have fully tested its practical working:

#### BOSTON.

I take great pleasure in adding my own testimony to the great value and success of the telegraph fire alarm; and I feel confident in saying that wherever once tried it will thereafter be deemed indispensable.

ALEX. H. RICE, Mayor of Boston [1856].

#### ST. LOUIS.

The superintendent of the fire-telegraph of St. Louis, in his report for 1860, says:

"A comparison of the two years' working of the department, prior to the establishment of the electric alarm, with the two subsequent ones, shows the following results: From April, 1856, to April, 1858, there were 568 alarms, of which 175, or nearly one-third, were false.

"The losses by fire during the same period show greatly in favor of the last two years. From 1856 to 1858 the amount of losses was \$1,803,315 against \$710,404 from 1858 to 1860, showing a diminution of \$1,092,911, or a sum equal to \$548,955 annually; and, on the principal that prevention is better than cure, we claim for the fire-alarm telegraph a large share of the credit in saving that amount."

#### TWENTY-ONE YEARS LATER.

The same official in his report for 1881 says:  
"In 1858, when the Electric Telegraph, as applied for fire alarm purposes, was in its infancy, the nucleus of the present system was introduced into this city. It was accepted by the authorities with considerable misgiving as to its practical utility, and it was looked upon generally as an experimental adventure, involving quite a sum of money. As time passed by, however, it gradually began asserting itself; skepticism as to its practical value faded little by little, until finally, guided by scientific research and mechanical improvements, it stands before the world to-day as being one of the most valuable achievements of man."

#### ALBANY.

In this city we would much prefer to have four steamers with the telegraph than eight steamers without it; and the same will hold good in any city. JAS. H. MCQUADE, Chief Albany Fire Department.

The fire-alarm telegraph is in complete order, and has worked most satisfactorily during the year. In fact, it has never failed since its construction. It is a most valuable auxiliary to a fire department; for, in truth, without it, it would be unable to maintain the high degree of efficiency shown in our organization. Always reliable, the citizen feels assured that within a few minutes after the discovery of a fire the means will be at hand to extinguish it.—Report of Albany Fire Commissioners, 1874.

#### MONTREAL.

As the simplest illustration of its great value, we have the fires and loss for a fair average year, before and since its introduction.

Before, 85 fires.....	\$140,088 loss.
Since, 99 fires.....	35,428 loss.

A. BERTRAM, C. E. F. D. [1866].

The cost of construction will, of course, depend upon the amount of apparatus required and the extent of territory to be covered. But we have placed the prices of fire-alarm telegraph within the means of all towns, either large or small, willing to expend from \$500 upward to tell their Fire Department on the occurrence of a fire instantly and exactly where it is.

Full and detailed information given on application, personally, or by letter, to the Headquarters of the Company.

### A PROTEST.

The following "Printer's Protest," from the Albany Argus, will touch also a sympathetic chord in telegraphic circles :

Oh, why don't people form their a's,  
And finish off their b's?  
Why do they make such crooked c's  
And such confounded d's?

Why do they form such shocking e's  
And f's with ague-fits?  
Their g's and h's are too much  
For any printer's wits.

What a human eye is without sight  
Is an i without a dot;  
J's are such curious crooked things  
We recognize taem not.

K ought to stand for kussedness,  
But comes in we'l for kick;  
L's and m's are mischievous,  
While n's just raise Oia Nick.

O's are rarely closed at all,  
And p's are suaggy things;  
Q's might as well be spider legs  
And r's mosquito wings!

Some people make a passing s,  
Who never cross a t,  
Others use the self-same strokes  
To form a u or v.

W's get strangely mixed,  
X's seem on a spree,  
Y is a skeleton on wires—  
Zounds, how we swear at Z!

& yet, just think, what typos get  
From drivers of the quill—  
They call us such a careless set  
And scribble on at will!

Well, they will scribble, and we must swear,  
And vainly try to please,  
Till they go back to school and learn  
To make their a, b, c's!

Thomas Alva Edison.

The *Telegraphic Journal*, of London, in an extra number published by it on Nov. 5, gives a partial and carefully-written biographical sketch of Mr. Thomas A. Edison. We all know what has been said of Mr. Edison on this side of the Atlantic, so that it is interesting now to learn how the great inventor is regarded by European electricians and scientists. THE OPERATOR published a biography of Mr. Edison about three years ago, but a study of the lives of such men is always profitable reading. The *Journal* says:

America has long been renowned as the land of mechanical invention; but she has conspicuously distinguished herself during the last few years. This has been largely due to the genius of Mr. Edison, who, by his many remarkable inventions, which it is needless to enumerate, has

drawn upon himself and his native country the attention of both the learned and unlearned in the whole world. Mr. Edison is the chief figure amid a perfect host of inventors, great and small, who swarm in the United States; and being also a

spring of enthusiasm which are ever ready to welcome anything in the shape of a prodigy.

Thomas Alva Edison was born at the village of Milan, in Erie County, Ohio, on Feb. 11, 1847, and is therefore nearly 35 years of age. His

Thomas A Edison

self-made man, he has been almost worshipped by his countrymen. There was something almost magical in these inventions, which appealed powerfully to the imagination; and when it was known that their author was a self-taught telegraph operator, who looked a mere boy, it is no wonder that Edison was lionized as he has been. Such a character, like Balzac in fiction or Mme. Bernhardt in art, breaks the commonplace monotony of existence, and lets loose those hidden

father was of Dutch descent, and had been in turns a tailor, a nurseryman, and a dealer in land and lumber. His mother, though born in Massachusetts, was of Scotch parentage and a woman of good education, she having formerly been a school teacher in Canada. Indeed, she may be regarded as the sole teacher of her boy, for the two months' regular schooling he received is of no account. Like many other famous men, therefore, Edison was much indebted to his mother.

Like many other famous men, too, Edison, as a boy, was fond of amusing himself alone. He was a great reader, and did not complain about the nature of a book, so long as it was a book of some kind. It is related that he once set himself to read through an entire subscription library, beginning at the bottom shelf, and that he had penetrated several shelves before his project was given up. At ten, we find him reading books of chemistry, and when he began the world as a train-boy on the Grand Trunk Railway of Canada and Central Michigan, he littered the empty baggage car, which served him as a store for his fruit and newspapers, with old retorts and bottles of chemicals which he had picked up at odd times for a few pence.

With the Yankee instinct for "getting on" abnormally developed, he purchased a second-hand printing press, together with a quantity of type, and started a newspaper of his own, entitled *The Grand Trunk Herald*. Of this literary venture he was proprietor, editor, staff, publisher, printer and devil in his own person; and it obtained the flattering celebrity of being noticed in the *London Times* as the only paper printed and circulated in a railway train.

During this time he was investigating everything mechanical which came under his notice. He pored over the working of the telegraph, he studied the locomotive, and once ran the train between two stations himself. He also continued his reading, and "Newton's Principia," side by side with "Ure's Dictionary of the Sciences," and "Burton's Anatomy of Melancholy," could have been seen on the newsboy's shelf. He also took to chemical experiments in an evil day for the pursuance of his new business, for one day he accidentally set fire to the baggage-car, and the irate conductor put a summary end to his literary career and his scientific researches, by ejecting him and all his traps, chemicals, fruit and printing press included, out of the car.

From his first acquaintance with it, the telegraph has exercised a strong attraction over him; and it was a turning-point in his life when, after he had gallantly rescued a child of the Port Clements station-master from being run over on the line, the grateful father undertook to teach Edison how to telegraph.

Edison was meanwhile turning his versatile talents to account as a shoemaker, a trade which he had picked up in some unaccountable way; but the work was distasteful, and he took a situation at Port Huron, Mich., as a telegraphist.

From this time, for several years, he led the life of a traveling operator, now engaged in Canada, now in Indianapolis, now in Cincinnati or Louisville, now in Memphis and Boston. Many amusing stories are told of his ready ingenuity and gawky appearance during this period. His mind was now fairly directed toward invention, and he acquired the habit of experimenting and thinking at night, after the duties of the day were over. At Memphis, in 1864, we are told that he devoted himself to the problem of duplex telegraphy, and after having his studies and ideas frequently ridiculed and discountenanced by his ignorant fellow operators and chiefs, he found his way to Boston in 1868, where he met with more encouragement and better success. "In spite of his peculiar fashions of passing his time," says a writer in *Scribner*, "he had become one of the most accomplished operators. He overcame obstacles put in his way on account of a somewhat uncouth appearance, and soon took an important position. He had up to this time dallied with a number of ideas he has since perfected, acquired a beautiful, small, rapid handwriting, as clear as print, and gratified considerably his desire of seeing the world. He had once been on the point of sailing for South America, from New Orleans, but had only been prevented by an accident. A new period commenced for him. Some small things of his succeeded—a dial instrument for private use, a chemical note-recorder, and others—and he began upon a vibratory principle of telegraphing. He commenced a great epoch in one's history—to believe in himself. Up to this time he had not done so. 'I did not think,' he says, 'that I was competent.' He was not successful, however, in an important trial of his duplex system, and was soon again adrift."

He went to New York in a disconsolate mood, and happening to be in the office of the Gold and Stock Company at a critical moment when their indicator was out of order, he repaired the instrument and secured an engagement with the com-

pany. He soon invented a printer of stock which was adopted by the company, and from that time his progress was assured. He was also taken up by the Western Union Telegraph Company, and retained by both companies at a handsome salary, to give them the first bid for his new inventions. He was now in a position to start a manufactory of his own at Newark, N. J., where he made all his gold and stock printers, and employed about 300 men; but the business left him too little leisure for invention, so he sold out and retired to Menlo Park, a new settlement of a few yellow-painted wooden houses on the Pennsylvania Railway in New Jersey, about twenty miles from New York. Here he built a large barn-like structure upon the top of a hillock, and fitted it out as a workshop and laboratory, the workshop being on the basement and the laboratory upstairs.

We need not dwell at length on his several inventions, for they have been so frequently cited and published of late that they are familiar to most electricians. Before the invention of the loud-speaking telephone and the phonograph had enormously extended his fame, Edison was becoming known in Europe as a rising young genius, sure to do wonders in his day, and his gold and stock printer, his electric pen, electromagnet and quadruplex system, had given him a solid reputation as an electrical inventor. Then came the invention of the carbon telephone, the phonograph and microtasmeter, which swelled his fame to world-wide bounds, and finally, as if to inflate it to bursting point, he telegraphed the enthusiastic but rash announcement across the Atlantic in October, 1878, that he had solved the problem of the divisibility of the electric light, and would soon be able to light up our homes by electricity, at a mere fraction of the cost of gas. A year or two has since passed by, and although the letter of announcement cannot yet be said to have been fulfilled, yet, by dint of ceaseless energy, Edison has gone far towards accomplishing what he anticipated. The exhibit at the Paris Electrical Exhibition shows that he has overcome some of the obstacles in his way, and that he has obtained a large measure of success. The invention of the phonograph is undoubtedly one of the most transcendent flashes of mechanical inspiration that ever entered into the mind of a man; and the loud-speaking telephone, with its carbon transmitter and prepared chalk receiver, is one of the greatest marvels ever constructed out of dead matter. On hearing it and examining it, we cannot but wonder at the daring hardihood and patience of invention which has made it what it is.

Edison has taken out in all about three hundred patents. He has been called "the young man who keeps the road to the Patent Office hot with his footsteps." His plan appears to be to patent all the ideas that occur to him, whether tried or untried, and to trust to future labors to select and combine those which prove themselves the fittest. The result is that the great bulk of his patents are valueless in point of practicability; but they serve to fence the ground in from other inventors.

From our illustration, it will be seen that Edison's appearance is youthful in the extreme. "When you go to his house," says a writer, "he may very possibly answer your inquiry for 'Mr. Edison' himself; or, if not, you will be shown into his laboratory, where you will find him among his assistants; and if you try to guess which is Mr. Edison, your best plan will be to select the least obtrusive person in the group. His figure is slight and young-looking, though the face, from its long habit of concentration, has an old look; he has a frank, cordial expression, and, like most men of great powers, can be almost a boy when his attention is turned away from his absorbing interests. But when he is not aroused he seems to retire within himself, as if his mind had traveled a long way off, and his attention comes back slowly. He has the peculiar pallor of a night-worker, and if you stay with him through the night, you will find him as bright at the end of the vigil as at the beginning." His power of work is something extraordinary, it being usual for him to work sixteen hours each day, and at a stretch; as, for example, when he invented the phonograph; he has eschewed sleep for days and nights on end. More than one assistant has already succumbed to the strain of trying to keep up with him.

Mr. Edison is married, and has three children—two boys and a girl—one of each sex being nicknamed respectively Dot and Dash. He is young, and as he comes of a long-lived stock, notwithstanding the severe strain to which he subjects his powers, we may reasonably expect that he will continue to bestow many useful inventions on his age. We can assure him, says the *Journal* in conclusion, that should he ever fulfil his intention of coming to England he will meet with a cordial reception from English electricians.

#### Review of the Past Two Weeks.

Since our last issue the Mutual Union Telegraph Company has fairly opened for business, and has received fully all the patronage it had expected. It commenced by charging the same rates as the Western Union charges. The lines are now open for business to Boston and other important points east; to Philadelphia, Baltimore and Washington south, and to Albany and intermediate points north, and it is expected will be open to Chicago, St. Paul, St. Louis and other western and intermediate cities during the present week. There are now seven branch offices in this city opened, as follows: No. 126 Front street, Nos. 148 and 2,281 Third avenue, No. 5 Union Square, No. 529 Broadway, No. 331 Greenwich street and No. 996 Sixth avenue. The main office of the company is in William street, just below Pine street. The tables there are arranged for 80 instruments. The office is being superbly fitted up. It is expected that the new company will have handsome quarters free of rent in the Post-office, this favor having been granted to the Western Union. It has also secured the right to run its wires over the East River bridge, paying annually a toll of \$30 a wire therefor, and thus obviating the continual annoyance from broken cables by ships dragging their anchors.

The Baltimore & Ohio Railroad Company, doing business as a telegraph company, has also obtained a footing in this city. At a joint meeting of representatives of this company with the representatives of the American Rapid Telegraph Company, Nov. 19, a contract was entered into by which the Baltimore & Ohio leases for business purposes, between Baltimore and New York, four wires of the telegraph company, and engages to have two wires ready within thirty-five days between these two points by way of York, Harrisburg, Allentown and Easton. In New York there will be ten offices provided, including one in the Stock Exchange. The American Rapid Telegraph Company already covers the New England States with its wires, and the result of the agreement of the 19th ult. will be an exchange of its business with that of the system of the Baltimore & Ohio Railroad, embracing 5,000 miles of wire and covering Washington, Wheeling, Cincinnati, Cleveland, Chicago and St. Louis. This telegraphic venture is a pet scheme of Mr. Garrett. The fact of the B. & O. leasing wires from the American Rapid would imply that its working arrangement with the Mutual Union has been abandoned, and that they are now working in rivalry.

The Mutual Union, however, will not miss the aid of the Baltimore & Ohio, since it will soon have a line of its own to the West. It is also reasonably certain that an extensive press bureau will develop in connection with this enterprising rival of the Western Union. Furthermore, in asking recently for space upon the floor of the Stock Exchange in this city, the Mutual Union applied for the sweeping privilege of doing "all kinds of telegraphic business," thus making itself a probable rival to the Gold and Stock Telegraph Company, which now holds a monopoly of the sending out of quotations. The Mutual Union claims to possess a "ticker" of original design, and which can be depended upon for as rapid and thorough work as that of the Gold and Stock Company.

The New York *Times*, in commenting upon the fact that the Western Union Company is to lose its monopoly of the telegraphic business in the New York Stock Exchange, says: Many complaints have been made of the service furnished by the Western Union and not infrequent-

ly of late intimations have been given that competing companies would soon be admitted to the floor of the Exchange. But these hints have made little impression upon either the Western Union or its patrons. Few have anticipated the change in affairs which *The Times* is authorized to announce, to the effect that leases are to be executed for space in the Exchange to no less than three other companies. The Continental Company, which for some time has been recognized as under the Western Union control and merely a tender to that company, is to be retired. The new competitors are the Baltimore & Ohio Railway line, the Mutual Union Telegraph Company, and the Bankers' and Merchants' Telegraph Company. Each of the three will be fully equipped for a rush of business. The Bankers' and Merchants' Company now owns 12 wires between this city and Philadelphia, and probably is better able than any other line to give prompt service to and from that city.

Strenuous opposition is still being made throughout the country to the erection of opposition poles. In Jersey City, on the 21st ult., Mr. Henry Platner and 24 men of the Mutual Union were arrested and fined \$10 each, with the alternative of ten days in the calaboose, for erecting poles in violation of a city ordinance. This opposition comes, it is said, from the Western Union. The prisoners' counsel created a lively scene during the hearing by declaring that the Board of Aldermen refused them permission to erect poles because they would not "buy" the Board. The latter body subsequently appointed a committee to look into the charges made by the lawyer of the Mutual Union Company.

At Bloomington, Ill., a party of pole-choppers found that their lawless doings could sometimes be brought up with a round turn. About forty poles belonging to the Mutual Union Company, across the Dawson tract in McLean County, were dug by Western Union employes, under the instructions of its Superintendent. Upon their return to Bloomington these men were all arrested, and application was made for a preliminary injunction restraining the Western Union from further interference with the wires of the Mutual Union. On the day set for the hearing of the criminal cases against the Western Union Superintendent and his employes, the attorney of the Western Union sued for peace, and begged of the attorneys of the Mutual Union to withdraw the criminal charges against their Superintendent and employes, they agreeing to make no opposition to the issuance of a permanent injunction against them, and further agreeing to pay all costs and expenses of all the cases, including the expenses of reconstructing that part of the line torn down. The Mutual Union acceded to the proposition, and so the matter was settled.

Cable work is progressing rapidly in South American waters. A cable despatch has been received announcing that over one thousand six hundred miles of submarine cable intended for the Central & South American Telegraph Company have been shipped on the steamers *International* and *Dacia*, which sailed from London respectively on the 10th and 15th ult. The remainder of the cable will be shipped in February next. It is expected that this country and Mexico will be in direct telegraphic communication with Peru and Brazil by June next.

Since Mr. Jay Gould obtained control of the Manhattan Elevated Railway all the ticket-sellers on that line who are telegraphers have had their pay increased from \$2 to \$2.25 per day. The outlay is recouped, however, by decreasing the pay of all ticket-sellers who are not telegraphers from \$2 to \$1.75 per day.

Some of the messenger boys in this city have indulged in a strike on grounds more poetical and emotional than wise and sound, and some of them were sent to jail. It appears the Mutual District boys at No. 48 New street, were very fond of their manager, Henry E. Wallace, and when they learned that an order had been made for his transfer to an up-town office their expressions of condemnation of the action were so decided that trouble was feared by the officers of the company. The transfer was insisted upon, however, and on the 22d ult., the boys, about seventy in number, struck. Detachments of messengers from other offices of the company were detailed to fill the strikers' places. These were interfered with by the strikers. Before the police made any arrests, one of the substituted messenger boys had one of his ears nearly bitten

off by a leader of the striking boys. The police arrested four boys, Thomas Gray, Henry Shiner, George Moran and Edward Hassart. They were taken to the Tombs Police Court and were charged with disorderly conduct. Justice Kilbreth sentenced three of them to ten days' imprisonment each and discharged the fourth.

In bright contrast to this episode was the banquet given, at Boston, on Thanksgiving Day, to the telegraph messengers by the merchants of that city. About seventy lads sat down to dinner, and as they progressed from turkey to oysters, and pudding, and fruit, and ice cream, it is not necessary to say that the fun became fast and furious, and that the Crawford House rang with uproarious applause when the "lay-out" was unanimously decided to be "immense." At the head of the table, bearing themselves with all the grave dignity of capitalists, were "the guests"—being five boys in the employ of the Mutual Union Telegraph Company, and five more from the District Telegraph Company. Treated with all the honors usually belonging to guests, these little fellows seemed proudly conscious and thoroughly appreciative of their position. Toward the close of the dinner, Mr. Thomas Martin, receiver at the State street office, spoke to the boys briefly, complimenting them upon their energy, honesty and faithfulness, as evinced during the year, and encouraging them to still further efforts. Mr. J. J. C. Wilson, also in the employ of the company, followed Mr. Martin, and earnestly urged his young hearers to strive, while doing their duty, to advance higher and higher day by day. They could not always be telegraph messengers, and should have thoughts for the future. If each lad did his best, and improved every opportunity for advancement, the future would be a bright and a proud one. The boys gave three rousing cheers for Messrs. Wilson, Martin and others of the clerks who had gathered to witness the dinner, and seemed to appreciate the advice offered them.

The boys of the American Rapid Telegraph Company were also at the Crawford House in the afternoon, and their dinner of turkey was as heartily enjoyed and attended by virtually the same incidents as at the Western Union boys' feast.

#### Practical Hints to Telephone Inspectors.

Nearly all telephone exchange companies have on their pay-rolls a class of employes who, by common consent, are denominated "inspectors," although inspection usually and rightly forms but an inconsiderable fraction of the duties devolving upon them. In exchanges located in the smaller cities and towns, where a perfectly organized corps of employes is necessarily, on the ground of economy, a practical impossibility, the duties usually falling to the lot of inspectors must, of course, be performed by the general utility man, who may combine the offices of lineman, batteryman, inspector and general constructor. He will, for the purposes of this article, come under the third head.

It must be remembered that the writer of this article, not being at present concerned in the active management of any telephone exchange, is compelled to confine himself to generalities, to indicate the methods which, subject to modification by individual conditions, would be employed by himself; and, therefore, to glean any profit from these pages, each reader must in practice make the requisite variations from the text to suit his own case, in so far as he agrees with the writer, and be prepared to pass without remark anything which he cannot agree with.

It is a very difficult thing to lay down a series of iron-bound rules for the use of inspectors in a business where so much depends upon the exercise of discretion, and yet it is, on the whole, better to provide a system of rules, as an inspector who is worth his salt will have sufficient

sense to break them if a really necessary case comes up.

The duties of an inspector should be to examine regularly and at stated intervals the apparatus—including bells, telephones and batteries—at each subscriber's station, as well as the leading-in wires; and also, as far as practicable, the line wires. He ought, moreover, to make himself perfectly acquainted with the direction in which the line wires run, such a knowledge assisting greatly in the localization of line troubles.

He should be able to perform necessary repairs, and, remembering that an ounce of prevention is worth a car load of cure, should be careful when inspecting any apparatus to leave everything pertaining thereto in an A 1 condition, so that there will be no likelihood of any trouble occurring there between visits.

An important part of his business is to discover promptly the cause of any trouble which may manifest itself, and, when he has discovered it, to know that it is the right cause. He should never touch, disarrange or readjust any instrument or portion of apparatus, until he is sure wherein the trouble lies. It is necessary also for him to know when to leave anything alone, and this is, in many cases, the most difficult thing for an inspector to learn.

To leave everything else immediately when any trouble is reported upon a circuit, and to locate and, if possible, remove the trouble before leaving it; to report faithfully the nature and cause of the trouble, and to suggest means to prevent its recurrence; and to become thoroughly acquainted and familiar with the central office, especially the switch-board and all appliances connected therewith—so that when an emergency arises, he shall be competent to assume intelligent control of the office, or in the event of any defect occurring there, he may be able at once to find the trouble and remove it—should be the aim of every inspector.

Many other duties will, of course, be laid upon the inspector from time to time; but the above will probably form his daily work.

In the accomplishment of his diurnal inspection, he will find it frequently necessary to make slight repairs at a subscriber's station. He may often have to change the instruments and to adopt temporary remedies for electrical defects. It is, therefore, advisable that he shall be supplied with convenient tools and instruments, whereby his work may be expedited and his time economized.

The following articles will all be found useful; many of them indispensable: First and foremost, the "pliers" (if only one tool is at hand, let it by all means be a pair of pliers with cutting edge); a small, well-tempered screwdriver, a pair of tweezers, an infinitesimal oil flask and a coil of magnet wire.

Without these tools the inspector should never take his walks abroad. It is always prudent to carry a Leclanché zinc or two; a couple of packages of sal-ammoniac; half a dozen or so of one-inch and inch and a quarter blue screws and a paper of double pointed tacks.

It is well that inspectors should know what they are expected to do, and that when they do know, they should be required to do it.

Those exchanges wherein all the employes are made to feel that they have an interest in the success of the system, and in which the employer takes an interest in the well-being of the employed, are invariably the most successful in operation. I know of several exchanges where, every week, the superintendent gathers together his office managers and inspectors, and each man details his week's experience and compares notes with every other one. If any employe has found cases which he has not clearly understood, or thoroughly mastered, he describes the case and it is discussed, much to the benefit of all concerned. The idea is an excellent one and should be universally carried out.

In my opinion, the following rules, or similar ones, should be laid down for the guidance of inspectors:

Each inspector to be promptly on hand at the regular time—whatever that time may be.

A complaint book or bulletin board to be kept on the office table, where it is accessible at all times; inspectors to be required to examine the book every morning before going out, to see if any complaint has been received over night.

Previous to starting on a regular inspection route, the inspector must ascertain from the

office manager if any circuits have been noticed out of order; should there be any, he must attend to the trouble the first thing.

Every inspector should be required to see all his subscribers' instruments at least once in two weeks, and upon every visit should ascertain from the subscriber what the condition of the service has been since the last visit. In case of any specific trouble being mentioned, in addition to testing for the same, it must be reported at the office, that the cause may be fully investigated. (It will be most generally found that complaints of a general character arise, as graphically stated by a Western exchange manager, from "pure cussedness" on the part of the subscriber. It will never do, however, to say this, or even to intimate as much).

Inspectors should be required to keep every part of the telephonic apparatus perfectly clean, and, to aid them to this laudable end, they should be furnished with a small soft-haired paint brush, with which to brush off accumulated dust.

They should be required to test thoroughly each instrument inspected, which may be done as follows: On entering the subscriber's office, the inspector should first brush away the dust from the instrument, and, with a cotton cloth carried for the purpose, otherwise brighten up and clean the apparatus. He should then try each screw-post, to see if they are perfectly tight. He ought also to carefully look over the ground wire and see that it is well fastened to the ground connection, whether it be gas or water pipe.

He should look in the battery box and try the battery connections; scrape off any accumulated salts that may have gathered round the jar, and see whether the zinc is intact and whether all the sal ammoniac is dissolved. Of course, any loose screws must be tightened. Any zinc worn nearly through should be taken out and replaced by a new one, and if the liquid has no sal ammoniac in it, about half of an ordinary package should be put in.

Having done all this, then and not until then should he call up the central office, and thus test the calling generator. If a prompt response be obtained, he will thus know that the calling apparatus is in good order. The time taken to get a response should be noted, and, if unreasonably long, reported and the cause ascertained.

He should then desire the central office to signal the subscriber's office, and thus test the alarm apparatus or bell.

The telephone and transmitter will, of course, have a practical test by the necessary conversation.

If all is well, he may then pass on to the next subscriber, giving, as he leaves the office, a look at the entering wires, both inside and out.

It is now evident that there is a positive advantage in giving the whole apparatus a rigid scrutiny, and in fixing any loose screw, defective battery or other apparent trouble before testing the operation of the instrument. Many troubles can thus be detected and removed which, were actual operation alone trusted to, would not always manifest themselves then, but would appear at some early period; and, even though they did affect the present operation, would necessitate more than one call to the central office, thus wasting the time of both inspector and operator.

In the event of finding some part of the apparatus out of order, he would, of course, not leave that place until the trouble should be removed, or, in any case, until the instrument should be put in temporary repair.

No inspector to be allowed to adjust or disarrange any part of the telephonic apparatus, except for the removal of a fault, and then only if he knows where the fault is and in what it consists.

If any inspector shall incidentally see the instruments of a subscriber which are under the care of any other inspector, and shall ascertain that they are in any way out of order, he should fix them to the best of his ability, and report the case and his action thereon, on his return to the office, to the proper inspector.

All inspectors know ought to the telephone wires, and if, while passing in the streets, he should see any that are out of order or in a dangerous condition, he is to report the matter to the proper department; or if he shall see any telephone wire lying broken, he is to make a

temporary splice with office wire between the two broken ends.

Should an inspector happen to be engaged outside upon any case that takes considerable time it will be his duty to report his whereabouts frequently to the central office, so that he may readily be found in case of trouble.

Regular inspection work must be dropped in order to respond to a complaint from a subscriber, and circuit troubles shall take precedence of all other complaints.

Other and probably better rules, and more of them, are doubtless in force in many exchanges, but the proper observance of the above will tend toward good work.

It is intended in a subsequent article to suggest the proper course to be followed in testing for troubles, and to give some practical and simple hints for ascertaining the cause of troubles and for locating and removing them.

### The Operator's Victim.

An individual with a decidedly country look about him, and a liberal quantity of hay-seed strewn through his locks, entered the Western Union Telegraph office at Puree, one cold afternoon last November. The office was occupied by the gentlemanly operator, Henry Smart, and four or five genteel young loafers, at whom Henry slyly winked, as much as to say, "Here's some fun, boys."

The new comer shuffled up to the counter in a somewhat careful manner, as if not quite certain how to proceed. After nodding at Henry in a friendly way, he asked, cautiously, "How much does it cost to send a dispatch?"

"Four dollars," responded Henry, without a moment's hesitation.

"Four dollars!" echoed the countryman, amazedly, "why the dispatch operator at the Merican Onion office said he would send one to Shuffeld for 50 cents, ony thar wire was busted."

"Of course," said Henry, smiling blandly, "we would tell you the same thing if our wire was down. How can they send it, if their line is broken? But," he continued, after a moment's pause, "it all depends on whether you want to send a black or a red message"—and he waited for the granger to decide.

"I dunno the difrence 'twixt black an' red dispatches," the latter answered, looking decidedly uncomfortable and fidgeting around considerably.

"Well," said Henry, in a slow, doubtful manner, "I don't know that I ought to tell you, as it's a trade secret; but if you promise not to say anything—"

"Ye can jest bet yer life, I'll never squeal," interrupted seedy; "I'm one of the boys," and as he spoke he dived into the capacious vest pocket and produced half a dozen cigars. "Thar, try 'em," and he squinted knowingly as he spoke.

"Thank you," said our hero, proceeding to light one, mentally congratulating himself that he was "playing it fine." "Now," he continued, bending close to the customer's ear, "you must never, not even hardly ever, breathe a word of what I say to a living being."

"Ye kin depend on me," answered the victim in a low, confidential tone.

"Well, then," said Mr. Smart, "the black messages are those received by black operators and delivered by blacker messengers. They are paid good wages, as negroes will not work cheap; the black messages cost most. As for the red messages," and he dropped his voice to a still lower stage whisper, "they are delivered by young Indians—reds, you know; hence their name. The papposes are captured when young, and sold for a trifle to the company, who raise them at little or no expense, and finally train them to deliver messages. They cost but a small sum for maintenance, and this is why they send red messages at one-half rate. They are called red, not only because they are delivered by reds, but also because they are sent at red-uced rates in a read-y manner, and are read in the morning."

"Wonderful! wonderful!" said greeny in a

surprised and delighted tone, while the small group of listeners lusted themselves in endeavoring to eat their hats, coat-trails, etc.

Just here a diversion took place: a loud booming noise was heard on the wires. The granger opened his eyes in amazement and looked around in speechless wonder. Again and again the noise was heard, seemingly growing louder and fiercer every instant. At last he managed to ask what it all meant.

"Oh, that's nothing," smiled Henry, "it's only the Republicans having a big time in Washington over the late election. That booming is the cannonading; it comes quite plainly on the tel phone wire." The other occupants of the office were so seated that they could look through the window and see some section men unloading a car of wood near the office, and an occasional stick, striking the telegraph pole, caused it to jar the wires to vibrate, and that was what occasioned the "cannonading."

"Wall, wall," said the countryman, in a relieved manner, "if that thar aint the goldurned-est thing I ever heard on—it beats me, sure!"

In a few moments the conversation on business was resumed, when the customer concluded to send a red message. The necessary blanks were furnished, and, after much labor, a message was written and handed to Mr. Smart, who promised to send it immediately.

"I'll wait till I see it go," said our country friend, somewhat nervously.

"Very well," said Henry, and walking over to the telephone, he opened the door of the battery box and deliberately placed the message around the glass jar. Closing the door, he seated himself at the telegraph table and pounded vigorously on the closed key about a minute, when he turned to seedy with a self-satisfied and complacent air. "Your message has gone, sir," he said, with as meek and unblushing a look as he could assume.

"Ye don't mean to say it has gone a'ready?" inquired greeny.

"Yes, sir, it's in Shuffeld now," and Henry smiled patronizingly.

"Wall, 'pon my honor," gasped his customer, "but that litening is a powerful thing. I gess I'll send another."

The blanks being again placed before him, he dashed off and handed to Henry the following message:

Pu. 2.25—

J. R. Perkins, Sf.

Please come to Puree on first train, and take charge of this office. Mr. Smart, who resigns on account of not being able to secure victims enough for his practical jokes, in so small a place, will post you on your duties. A. R. SPEEDY, Supt.

"The look with which Henry concluded the reading of the message may be imagined—I shall not attempt to describe it. He was one of the most crestfallen youths I ever saw," and Mr. Speedy, who related the above to me, laughed heartily.

"Did you discharge him," I asked, "and how did you happen to try to catch him?"

"No, I had gone to Puree on some private business for the company (it was before the consolidation), and finding it necessary to assume a disguise, I hit on that of a countryman, which answered my purpose admirably. After I had got through with the business I went to attend to, I found I must wait over two hours for the first train east; knowing Smart's proclivity for joking, I determined to at once give him a subject for practice, and cure him of the habit, which I think I did. I did not discharge him, but removed him to a smaller office for two months, to think over his misdemeanor. He is one of our best men, now.—TOM TROY in *The Railroader*.

At the Thanksgiving dinner to the Western Union messenger boys, at Boston, Mr. Martin, receiver at the State street office, called out Master Thomas Melville, messenger No. 97, and in a few very complimentary words, presented him, as a token of the esteem and affection of his fellow messengers, with a handsome gold seal ring. The presentation was received with a storm of plaudits from the youthful company about the tables. Young Melville is the lad to whose happy suggestion the boys owed their first annual Thanksgiving dinner.

### The Telegraphers' Mutual Benefit Association.

The fifteenth annual meeting of the above association was held in Room 56, Western Union Building, this city, on Wednesday evening, November 16, President James D. Reid in the chair. About 35 members and delegates were present, representing 1,024 members of the Association.

In his annual address President Reid said that the year just closed, although not marked by any notable increase, had, on the whole, been healthy and prosperous. After a feeling tribute to the memory of the late Mr. Ashley, Mr. Reid referred to the Boyce claim, and said that a sum nearly equal to the full amount of the regular assessment was received and promptly placed in Mrs. Boyce's hands. "Nothing," added Mr. Reid, "could better exhibit the spirit which pervades the Association, and which, I trust, we will never lose."

The annual report of the secretary showed the membership in the second division to be 130, or five more than it was a year ago. The receipts from the first division during the year amounted to \$27,968.96. The membership of the Association at the last annual meeting was 2,138; new memberships and restorations during the year, 122; in all, 2,260.

During the same period there were 22 deaths, two more than the year previous, and 92 lapses by default of the payment of assessments; in all, 1,163; leaving a membership Oct. 31, 1881, of 2,144. The total receipts during the year from all sources were \$27,968.96, which with the balance on hand at the beginning of the year, \$2,973.14, brought the total up to \$30,942.10. Death claims under the first division during the year (including a small amount of refunded fees and assessments) amounted to \$26,021.00. The current expenses were \$1,673.44 (less \$95.75 chargeable to second division), leaving a balance on hand of \$3,343.41.

The reserve fund is represented by twenty-one \$1,000 bonds of the W. U. Tel. Co., the market value of which to-day is \$24,570, showing a large net profit since their purchase. The actual balance is somewhat in excess of the amount stated, there being nearly \$200 of advanced payments not included therein. The interest received from deposits with the Western Union Company was \$186.96; interest on bonds, \$1,470; total, \$1,656.96—or within a few dollars of the entire current expenses of both divisions during the year; so that, as heretofore, the Association is carried on entirely without cost.

The amendment to the by-laws proposed by Mr. Garwood, of Philadelphia, to strike out the word "three" in Section XI and substitute the word "one" was adopted. The section now reads: "The claims of the beneficiaries of persons who have been members in good standing for one year next preceding death shall be regarded as indisputable and shall be paid without question."

The motion of Mr. J. F. Morrison, of Baltimore, Md., to amend Section XIII of the by-laws to read, "There shall be accumulated from the surplus from assessments and income a reserve fund which shall consist of an amount equal to two per cent. of the entire amount of insurance provided by the Association," was rejected by a vote of 800 to 224.

Mr. D. R. Downer's amendment to Article IV of the constitution to insert the words "accompanied by the names of twenty-five members approving the same," after the words "in writing," was adopted, so that it now reads, "That proposed alterations or amendments shall have been presented to the secretary in writing, accompanied by the names of twenty-five members approving the same, not less than 90 days prior to the meeting at which they are to be acted upon," etc.

Mr. Young moved the adoption of an amendment providing that a regular assessment of one dollar a month be made on each member instead of as at present provided. The question was laid on the table.

Mr. Reid having declined re-election, Mr. Clar-

ence Cary, attorney of the Western Union Telegraph Company, was elected President; C. H. Summers, of Chicago, was elected Vice-President; Mr. A. R. Brewer, Secretary of the Western Union Telegraph Company, Secretary; Mr. S. M. Taylor, of the Gold and Stock Telegraph Company, Treasurer, and W. H. Young, of Washington, Charles S. H. Small, F. W. Jones and James Merrihew, of New York, and John E. Zeublin, of Philadelphia, Executive Committee. Messrs. H. C. Robinson, R. W. Pope and T. P. Scully were unanimously re-elected as members of the Auditing Committee. Messrs. H. C. Lockwood, A. H. Watson, P. J. Tierney, D. R. Downer, R. W. Pope and T. P. Scully were appointed a committee to provide for the proper reception of the members and delegates at the next annual meeting. A vote of thanks having been passed to the retiring officers and members of the executive and other committees, the meeting adjourned.

### Notes and Queries on Electricity and Electromagnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible;  
Theoretical as far as necessary.

Q. 166. How are the conductors in submarine cables ordinarily insulated?"

A. Only three substances have been found suitable as insulators for submarine cables—gutta-percha, india-rubber and Hooper's material, which is india-rubber peculiarly treated. Of these gutta-percha has been and is most frequently used, on account of its well-known durability, being practically indestructible under water. It is not so good an insulator as india-rubber, and, moreover, as it loses considerable of its insulating power in warm climates, it is, in such climates, to a great extent superseded by india-rubber, especially that of Hooper.

At least three layers of the insulating medium are always used and are necessary. The insulation of cables ordinarily improves after the cables are laid, all things being equal.

The insulation, per knot, of the Atlantic Cable of 1866, which is insulated with gutta-percha, is 340,000,000 of ohms; that of the French Cable of 1869, from Brest to St. Pierre, insulated also with gutta-percha, is 235,000,000, while the cable laid in the Persian Gulf in 1868, and insulated with Hooper's india-rubber, attained the wonderful insulation of 3,900 megohms per knot. Even this has since been exceeded by cables of later date, insulated by the same material.

Q. 167. What is the general construction of a submarine cable?

A. Submarine cables are generally constructed by imbedding a certain number of copper conducting wires—which may be either single wires or a strand of several small wires—in a good insulating material, such as gutta-percha or Hooper's india-rubber, applied in successive coatings. This, again, for protection, is surrounded with tarred hemp, and an armor, consisting of several strands of large iron wire, is wound outside of all. These iron wires, in several long deep-sea cables, are also covered with tarred hemp. The Atlantic cable of 1865, for example, contains a central conductor consisting of seven copper wires twisted together. This is covered by four layers of gutta-percha, while between each layer a compound, which not only aids the insulation but tends to unite the gutta-percha layers to each other, is applied. This is known as Chatterton's compound. Its component parts are gutta-percha, resin and wood tar. This core is then covered with a layer of hemp in five strands, well served with a compound of Stockholm tar, pitch, linseed oil and beeswax. The whole is then covered by ten strands of charcoal iron, each strand covered with hemp. Thus the copper wire is a conductor, the gutta-percha and Chatterton's compound being for insulation, and the hemp and iron wire for protection.

Q. 168. What is meant by the term "retardation?"

A. Retardation is the technical term given to

a certain sluggishness of action which is observed when electrical currents are sent into long lines—particularly long covered wires, such as underground wires or submarine cables, because such wires are much nearer the earth than overhead lines. It is caused by the inductive action which arises between the conductor and the earth.

We have seen by the answer to query 4 that an electrified body has an influence on all conducting bodies in its immediate vicinity, causing them to exhibit signs of electrification. This is a case in point.

The current sent into the conducting wire attracts by this induction through the insulating covering an opposite electricity from the earth; and this opposite electricity, in turn, attracts the current passing in the conductor, and tends to hold it where it happens to be; in short, to transform it from dynamic or current electricity to static or resting electricity.

Thus we see that the first part of every current sent is, if we may so speak, held or detained by the cable to balance the induced opposing electricity of the earth, and it is not until the conducting surface of the wire is charged that any current can make its appearance at the distant end; signals are thus delayed and the delay experienced is called retardation.

As overhead lines are so much further from the earth, they are much less troubled by electrostatic induction and its effects, and it has been estimated that in this country the charge retained by an overhead line of from thirty to fifty miles long is approximately equal to that of about one mile of ordinary submarine cable.

Q. 169. How may an aerial line be led into a way station?

A. There are several methods. In an ordinary telegraph line the usual way is to plant a pole directly in front of the window where the wires are to be entered, and run the wires from each side to a separate bracket and insulator, from thence looping them in.

For short lines, such as those in cities, which are frequently housetop wires, a mode often adopted is to run the wire to a batten or counter-brace overhanging the eave, fasten it there to a hook insulator, and then drop it down to a block of wood beveled on one corner, which is spiked to the wall, close to the window where an entrance is to be made. Another way is to divide the line by the insertion of a non-conducting substance, such as a block or ring of glass or rubber, and to attach the conducting wire to the main wire on both sides of the insulator. To conduct the wires from the point where the line wire terminates there are also various plans in use. If the line is not a new one, but is already employed, a cut-out must invariably be applied across the new loop until the job is complete; that is the two wires of the loop must be connected by a short wire. The ordinary line wire may be led into an office if a hard rubber tube is inserted into the entering hole. The tube is fastened in the hole, with its outer end pointing down, so that no moisture can enter, and the wires then passed through and fastened on the inside. Another way often used is to terminate the line wire at the hook, or insulator just outside the entering hole, by twisting it around the hook, and then twisting it back on itself. About four inches of the line wire outside of the twist joint is then brightened, and a piece of kerite or rubber-covered wire stripped at the end, for about eight inches; the bared wire is also made very bright and is then, commencing at the lowest point, carefully and tightly wound around the brightened part of the line wire. The covered wire is finally led through the hole in the window or wall and secured in any desirable way on the inside.

It is well to know that gutta-percha-covered wire is not suitable for this kind of work unless well covered with tape soaked in preserving mixture consisting of wood tar, gas tar and slacked lime, because the gutta-percha is soon rendered useless by the action of the air.

Sometimes, where many wires enter a building, a cupola is built for their reception. On entering, they are led to binding posts, from whence they are directed to any desirable point.

This work of leading in wires is very important, as, if unskillfully or negligently performed, escapes are very likely to occur in the window-casing.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

Entered at the N. Y. Post-office as second-class matter.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, DECEMBER 1, 1881.

Americans visiting Europe will find **THE OPERATOR** on file at the AMERICAN EXCHANGE AND READING ROOM No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the *old* as well as the new address.

## NOTICE.

So many subscriptions expire with the year that the renewals about that time occasion considerable extra work in this office. Those whose subscriptions run out on or about Jan. 1 will confer a great favor by **FORWARDING THEIR RENEWALS NOW**. They will lose nothing by so doing, as the time they pay for will be added to their present subscription, whatever time it may expire. They will also save themselves the possible annoyance of missing any of the numbers. **TRY IF YOU CANNOT GET TWO OR THREE OTHER SUBSCRIPTIONS TO SEND WITH YOUR OWN.** An order for some of the books we publish would also be acceptable.

## TELEGRAPHIC ORGANIZATION.

The recent triumph over the Post-office Department of the organized telegraph operators of England emphasizes more fully the recollection of their dismal failure in the strike of 1871, the tenth anniversary of which will occur this day week, the 8th inst.

Their action at that time was hasty and ill-timed, and, as a consequence, even with the moral support and sympathy of the brokers and general public in their favor, they broke ranks in the short period of four days, and were beaten. Their action was right in the first place in banding together and exhibiting a little corporate self-consciousness, for power can proceed only from unity, but their great mistake was in permitting their final action to be precipitated, long before they were ready, by one of the most tyrannical, unscrupulous and vain-glorious officials that ever stooped to manoeuvre, and dicker, and bargain in thorough skin-flint style—they call it “Managing”—in a telegraphic bureau. Their experience with Frank Ives Scudamore was bitter, but it has proved to be worth the outlay; and, while we can obtain it all for nothing, it is just as well that he who runs may read.

In England, during the past summer, the dispute was just as acrimonious as, and the attendant circumstances were not any more fortuitous than, in 1871, but the dignity, self-restraint and prudence shown on this occasion by the operators there, as a body, has commanded the admiration of us all.

Many things have been learned since 1871. It has been admitted, primarily, that employer

and employé should go hand in hand, each working for the best interests of the other; and it has been fully recognized that any ill-advised attempt to increase or decrease hours of service, or to readjust the prices of labor, upward or downward, without due reference to the only law which can ever obtain in these matters—the supreme law of supply and demand—must result only in dismal failure to the party attempting such absurd impossibilities. It has been realized that a strike is a monstrous imposition upon the public, arising always and solely from over-zealous officials, like Mr. Scudamore, on the one side, and reckless agitators on the other, and that such an imposition upon the rights of the public can never more be tolerated.

Acting upon this dearly-bought experience, our British cousins saw that only quiet and sensible men—men of good judgment, yet endowed with the grit to speak their mind, when occasion required it—took the lead. There came a difference, but the pressure, though tremendous, was so gently applied that it was scarcely noticeable. There was no irritation, except that shown by “my Lords,” who squirmed considerably; and, while accepting “the proposals which you submit to them for improving the pay and general position of the telegraphers,” publicly warned the telegraphic force that “my Lords cannot shut their eyes to the means by which the claims for this improvement in the terms of service have been urged upon the Government,” and that henceforth the wrath of “my Lords” should fall heavily upon any employé “taking part in any extra official agitation.” Of course, “my Lords” had to let themselves down easily; but still there was no wild hurrah in the ranks, no bluster and no threats that were not backed up by action; while that perpetual bane of telegraphic organization, the loud-mouthed zealot with his war-whoop, his helter-skelter, Tommy-make-room-for-your-uncle air—who is usually the first to scamper off and crawl under shelter when fire is opened—was relegated to the rear, and a wholesome check was put upon his pernicious impulses.

ONE of the greatest evils in the telegraphic profession is the existence of the so-called telegraphic colleges, one of which—at the Cooper Institute, in this city—had a splendid advertisement in the editorial columns of the last number of the *Journal of the Telegraph*. The editor of the *Journal of the Telegraph*—when it last had an editor—knew, and everybody else in the business knows, that there is not now room enough for the proper advancement of the vast army of messengers and check clerks who are studying within our ranks, and that the multiplication of schools for teaching telegraphy is simply a heartless fraud upon the innocent students, and a standing menace to the interests of the public at large. This is the secret of the attacks of the New York *Herald* and other influential journals upon the Western Union Telegraph Company—the only company in America which seeks to attract unpracticed, and, of course, cheap labor into its ranks; that advertises to receive as students boys and girls utterly unprepared by instinct and previous education to commence the study of telegraphy, and to crowd them through to “perfection” in—as its official organ enthusiastically points out—six months; or, to quote literally from our somewhat dilapidated and down-at-heel contemporary—the aforesaid alleged *Journal of the Telegraph*—“from the first Tues-

day of October until the first of May, which period is deemed sufficient time for graduation.” We commend this to our cosmopolitan contemporary, the *Herald*. This style of “graduation,” while temporarily profitable to the Western Union Telegraph Company, is a disgrace to telegraphy in general. The standard of ability can never be lowered in any profession—not even on the score of economy—without lowering the self-respect of each member of that profession, as well as jeopardizing the interests of its clients. The introduction of quacks with six months’ training, which the *Journal* says is “deemed sufficient,” must bring the entire company into disrepute, and result in the total extinction of that experienced and thoroughly trained class of operators, of which it was the delight of that great and unparalleled leader of the telegraph—the late William Orton—to boast. For those who remain in the business we think that the time has arrived when a concerted, simultaneous movement should be made to elevate our profession to its proper sphere.

As far as we can learn, that corruption fund, \$250, which Secretary Peck, in his open letter of October 19, said he had “on special deposit in trust for the Western Union Telegraph Company,” has not yet been called for by the latter company, nor has our hint been taken to turn it over to the Telegraphers’ Mutual Benefit Association. Surely President Evans will not allow any one in the Mutual Union service to retain bribe money; Gen. Eckert is too chivalrous to think even of touching it; Mr. D. H. Bates is altogether too utterly utter to be concerned with anything immoral, while the Judas of the whole transaction has received his thirty pieces of silver, and has gone on his dismal way. Giovanni Purrisimo Morosini would not object, we know, to taking in \$250 that might be lying around ownerless, but since he has done no tall swearing lately he cannot lay claim to it. There is no alternative, then, but to let the poor, toiling operators have the benefit of that \$100 bill, numbered A 80,153, series of 1878; and the three fifties, numbered respectively Y 49,067, series of 1869; E 175,733, and E 321,772, both of series 1874. That \$250 must be watched.

Now that the Mutual Union is getting fairly to work we hope to see them demonstrate, by a series of promotions for merit and seniority in the service, that they realize the fact that the interests of the company and the operators are identical, and that weal or woe for one means prosperity or adversity for the other. This is a plan which the Western Union has often attempted to execute, and has as often failed in. Its consummation will go further than any other influence in bringing success to the company that practices it. It will stimulate the men to more cheerful and careful labor; it will encourage the lowest employé to qualify himself for the highest position, to which, in his long night of obscurity, he may ever look as his guiding star, and it will result, on the whole, in a better and more intelligent class of men remaining in the business.

THE Western Union, having a lease of the office formerly occupied by the American Union in Chicago—directly opposite the W. U. office—wanted to rent it, but, fearing that it might possibly fall into the hands of an opposition telegraph company, has kept it idle ever since the A. U. moved out. About two weeks ago an alleged “insurance company” offered to relieve

the Western Union of the expense of the white elephant by leasing it. As this would also put the office out of the reach of rivals, a bargain was speedily struck. It now turns out that the "insurance company" is none other than the detestable Mutual Union Telegraph Company, and both telegraphers and the public are enjoying a hearty laugh over the matter, while the Mutual Union has secured the office and location in Chicago it has been after so long.

CLAIMANTS for the original invention of the telephone are multiplying, and we may soon have a big crop of lawsuits over it. Since that will necessitate a critical examination of the records, it will be well for each litigant to possess himself of a copy of that excellent work, "Tales and History." There they may find an account of the telephone invented in China, by Kung Foo Whing, nearly one thousand years ago. Two hundred and ten years ago a whisper had been heard at a furlong's distance, "by the help of a distended wire." Then there was the "telephon" used in 1853, and the telephone of Mr. John Cammack, of Manchester, England, exhibited in 1860, as well as that of Philip Reiss, of Hamburg, introduced in 1861. Bell, Edison, Gray, Reiss, Cammack and Kung Foo Whing will very likely addle the heads of the judges when this thing gets into court.

THE annual report of the Secretary of the Telegraphers' Mutual Benefit Association shows the association to be in a prosperous condition. Although the number of members has not increased very much during the year, the association has, at least, not retrograded any in that respect. The total receipts during the year were \$27,968.96, as compared with \$19,708.49 during the previous year. The expenses were \$27,518.69, against \$17,548.43 in 1880; leaving a balance on hand of \$3,343.41, as compared with \$2,160.06 the year before. The amendment to the by-laws providing that claims shall be indisputable after the member has been in good standing for one year—instead of three as formerly—should make agents and the Executive Committee exceedingly cautious as to the risks they accept.

THE strike of the Mutual District messengers at the New street office, in this city, on the 22d ult., is not to be held up as an example to the senior members of the profession. The action of the boys in resorting to extreme measures upon so small provocation cannot be commended, although the tender years of the lads may serve as an excuse for their conduct—an excuse which by no manner of means can be pleaded for the official stupidity of "Justice" Kilbreth, who, with all the pomposity of a backwoods magistrate, sentenced three of these boys, all of tender years, to ten days' imprisonment each. A Judge with more heart and brains would, in this country at least, have given young America a severe lecture and then dismissed him.

THE idea of reproducing faithful pictures of prominent members of our craft seems to be gaining ground. We had recently to compliment our esteemed London contemporary, the *Electrician*, upon its very creditable engraving of the late Col. Glover, and now we have further reason to express satisfaction upon seeing that the issue of the *London Telegraphic Journal* of Nov. 5, just to hand, contains a remarkably fine engraving and a well written biographical sketch of Mr. Thomas A. Edison. All this is decidedly enterprising, and, while it enhances

the first cost of the journal, it is very popular with the reading public; and, in the light of our own experience, we may say that it is profitable in the end.

IN these days of salary scalping and official idiocy it is not often that a manager is found so popular with his subordinates as to have his removal bring on a strike. This was the case, however, with Manager Henry E. Wallace, of a Mutual District office in this city, who seems to be intensely popular with the boys. Striking for such a frivolous reason is to be deprecated, but devotion like that should be fostered in our ranks, where selfishness, conceit and oppression are now so conspicuous. In the spirit of their action, at least, we wish the boy were father to the man.

THE melancholy crank, Welles, who recently sent threatening letters to Mr. Jay Gould, was commonly believed to be insane. But when the jury of experts read his letter to Brother Jay, in which he said, "You have robbed the rich and the poor, the father and the fatherless, the widow and the orphan, indiscriminately, of their last dollar, and through your villainy have brought ruin and destruction upon thousands of thousands of families," they unanimously voted him quite sane, and remarkably observant and level-headed at that.

WE are glad to see an appreciation, on the part of the merchants using the telegraph, of those faithful little lads who carry their messages. It is no wonder that the turkey dinner given to them at the Crawford House, Boston, on Thanksgiving, was unanimously voted "im-mense" by the juvenile guests. The small boy is a great institution, and there is nothing like a rousing dinner for bringing out his good qualities. The small boy never forgets his patron, and we shall be much mistaken if the Boston merchants are not fully and quickly repaid for their thoughtful liberality.

TELEGRAPHERS in general celebrated Thanksgiving Day in the most appropriate style, as their continued prosperity warranted them in doing. One of them, however, Mr. E. L. Nowell, of the Boston & Maine depot at Salmon Falls, N. H., after indulging in too much turkey, celebrated the day by shooting Mr. George W. Wentworth in the neck and thigh. The victim will probably die, and this bloodthirsty telegrapher may then transfer his accomplishments to another line—with a noose on it—on which a "ground" is unknown.

THERE is some prospect now of the Postal Telegraph Company getting down to practical work. On Tuesday evening last, Nov. 29, a conference of capitalists interested in the Postal Company took place in one of the parlors of Delmonico's restaurant, on Fifth avenue. It was stated after the meeting that \$1,000,000 had been subscribed to the capital stock of the company, and that work on the Postal lines will be vigorously pushed forward. It is claimed that matters are now in such shape as to make early and definite results of the proposed work certain.

SINCE we have never failed to find fault with Mr. Jay Gould when his policy has seemed to be against the operators, we shall miss no opportunity of bestowing the much-needed word of praise when we are justified in doing so. Since Mr. Gould has become President of the Manhattan Elevated Railway, all operators on that line have had their pay increased from \$2 to \$2.25 per day. This is, at least, one meritorious act

which can be written to the credit of the great modern Croesus.

ALTHOUGH the Edison electric light has not yet quite reached that point where it can be seen in general use for household illumination, still those who ought to know feel confident that it soon will. In the meantime, telegraphers and electricians generally will read with interest in another part of the present issue the biography of the now world-renowned inventor who has done so much to make electric lighting a practical success.

A RECENT interruption in the cable from England to the Island of Jersey, in the English Channel, appears to have been caused by a somewhat unusual kind of trouble. The cable parted near the shore; but instead of an "earth" trouble being caused thereby, the gutta-percha closed over the broken end and sealed up the break, thus producing a "disconnection."

IN opening for business the Mutual Union has wisely steered clear of a possible war of rates, and charges the same tariff as the Western Union. This is a good beginning, for it is really not cheap rates that the public want so much as good work. If the latter be uniformly rendered no one will grumble about the existing prices.

THE telegraph in England has suffered tremendously from unusually violent storms this fall. On the 14th of October, and again on the 23d of the same month, the telegraphic plant of the country was seriously damaged—on land by trees falling upon the wires, and at sea by the anchors of drifting vessels breaking the cables.

THERE must have been a good deal of satisfaction for the Mutual Union in the spectacle of a gang of Western Union pole-chopping fiends laboring, under the law's high pressure, to re-erect forty poles belonging to the Mutual Union, which the said ruffianly gang were fairly caught in the act of devastating.

ENGLAND'S blind Postmaster-General has added another feather to his telegraphic cap. You can now write a telegram on ordinary note-paper, stick on sufficient postage stamps to pay for its transmission, and deposit it in a street letter-box. It will be sent by telegraph as soon as the box is emptied in the usual way.

ON MONDAY, the 26th inst., and Monday, the 2d prox., Western Union office hours will be from 8 to 10 o'clock, A. M., and from 4 to 6 o'clock P. M., except at repeating stations and principal offices, which will be kept open as usual, but with such reduction of force as circumstances will permit.

THE American Cable Company seems to be out of luck. After laying its first cable this fall, communication was broken. Then, on the 16th inst., its steamer *Faraday* broke her engines and returned to Falmouth under sail.

THE annual meeting of the stockholders of the Southern and Atlantic Telegraph Company will be held in this city to-day.

THE Mexican Telegraph Company has increased its capital stock from \$1,000,000 to \$1,200,000.

WESTERN UNION stock is quoted at 85½. Last issue it was 86½.

### A Model Telephone Exchange.

So much has been said and written with regard to the telephone exchange at Providence, R. I., and of certain changes and improvements which were being introduced there, that we are glad to be able to give the telephone readers of THE OPERATOR a complete and carefully prepared account of what the Providence gentlemen have accomplished, and the workings of the exchange under the new order of things.

It must be remembered that in the arrangement of the exchange and the manner of making connections a radical departure has been made from any system hitherto adopted in telephone exchanges. The new system, which gives universal satisfaction as regards both speed and accuracy, is being patented by the inventors, Messrs. J. W. Duxbury, Superintendent, and Henry W. Breckenridge, one of the electricians, of the Providence Telephone Company.

The Providence company has a central office in Providence, with eleven hundred subscribers, and also offices in Pawtucket, Woonsocket, Attleboro, North Attleboro, East Greenwich, Olneyville, Warren, Bristol and Pascoag, with a total of about sixteen hundred subscribers. These are allowed unlimited use of the wires in the whole territory; and as Providence is the business centre of the section in which it is situated, are virtually sixteen hundred subscribers centred in the Providence exchange.

The switch-boards adopted were manufactured by Messrs Post and Co., of Cincinnati, and have been fully described in their advertisement which appeared in THE OPERATOR of Nov. 1. They have given perfect satisfaction in every particular and coupled with various devices for expediting the work of the operators which have been added in Providence, have reduced the work of the central office to a minimum.

An average total of twelve thousand answers and connections is made daily in Providence offices, while the time of making connections averages a fraction over a minute between all points in the territory of the company. Probably the most convincing proof of the success of the new system is the fact that before it was adopted there was universal dissatisfaction among the public in consequence of poor service, with constant orders to remove instruments; but since the change was made not an order to take out an instrument growing out of unsatisfactory service has been given, and applications for instruments are made daily, without solicitation on the part of the company.

The system, as will be seen from the following explanation, is notable by reason of its simplicity and absence of confusion. There is no necessity for conversation between operators, except to rearrange something which has been incorrectly done, and a special circuit is provided for that purpose. There are no boys required, no tickets are filled out until connection has been made, and the subscriber gives his order directly to the operator at the switch-board of the party with whom he wishes to converse. Above all, the system is equally practicable whether the wires centre in one room or in several rooms or buildings at any distance apart. The wires are of all kinds—special, bi-polar, four party, clock and battery wire—and each switch-board is so arranged that a wire of any description may be connected into it. In fact, each switchboard is the facsimile of every other, with the exception of the names upon the list of subscribers.

There are thirteen switch-boards of twenty-five wires each, four of fifty wires and one of sixty wires, arranged on three sides of the operating room about eighteen inches apart. They are the standard pattern manufactured, by Messrs. Post & Co., as regards annunciators, cross bars, dials, etc., but instead of the calling apparatus and the means of connecting in the central office telephone usually applied in the Post switches, each wire on every switch-board passes through a calling key and a Snell spring jack before reaching the ground or bar leading to either of the switches in the room, in such

manner that the subscribers can be called and the switch telephone connected without breaking circuit or interrupting conversation when two subscribers are connected together. In fact, there is no ground ever on the wires in the central office when two wires are connected through. This has been found to be absolutely essential in consequence of many long lines extending from the Providence exchange, as the results were very unsatisfactory to subscribers under the old system of having one side of the office telephone constantly grounded. Two bars on each switch-board connect directly with every other switchboard in the operating room. Near the ends of the two bars a key is placed, which upon being depressed drops an annunciator at the other switch-board with which the bars are connected, showing the operator at the latter board that a connection has been made upon one of the two wires extending from the switch-board designated by the annunciator, and a peculiar arrangement is adopted whereby there is no question as to which of the two wires is used. The last mentioned annunciators are placed upon an extension fitted to the sides of the switches, and are no way connected with the lines leading from the central office to the subscribers.

The operation of the system is as follows: Suppose a call comes on line "5," switch-board "A," the operator throws the office telephone into circuit by means of the Snell jack through which line "5" passes (the pin connecting line "5" with the ground bar not being removed) and ascertains the wishes of the party who has called. Suppose the person desired is on line "20" switch-board "A," the operator, by means of the key through which line "20" passes, calls the desired subscriber, connects in the telephone by means of the Snell jack upon line "20," and when the subscriber answers, removes the two pins from the ground bars on the lines "5" and "20" to any unoccupied local bar, tells the subscribers to proceed with the conversation and reverses the Snell spring jacks, which takes the office telephone out of circuit. To ascertain when the conversation is finished, the operator has merely to connect the office telephone by means of the Snell jack on either line "5" or "20" without breaking the circuit or interfering with the conversation by grounding, and if the wire is not in use to place everything in its normal condition.

Suppose the party calling on line "5," switch "A," wishes to converse with some one on line "30," switch "O." After requesting the party who was called to wait a second, the operator at "A" switch transfers the pin from the ground bar of line "5" to the upper of the bars leading to "O," and presses the key to the left of the bar marked "O," which drops an annunciator at "O" showing the letter "A." The operator at "A" disconnects the telephone and has nothing further to do with the connection. The operator at "O," observing the annunciator marked "A" fall, immediately, by a peculiar device, connects the switch telephone upon the wire leading from "A" and asks the subscriber what is wanted; in response to which inquiry the subscriber gives his order a second time, and being now in direct communication with him, the operator at "O" proceeds to call up the party desired on wire "30," and tells them to proceed with the conversation, or can inform the first subscriber directly if the party desired does not respond to the call. The operator at either switch ascertains if conversation is finished by use of the Snell jack upon the respective lines.

Various devices are adopted to perfect the system; among them the following: The wires connecting the switches together are grounded when not in use in such a manner that if the operator at "A" has connected his subscriber's wire direct to "O," and the operator at "O" fails to respond at once, the subscriber still can call the operator at "O," as his wire is grounded on the bar at "O," which leads from "A," upon which he is connected. Practically, no circuit is left open for a moment, as there is always a ground in one of three places: First, the ground bar, when the wire is in normal condition; secondly, the ground at the end of the bar in the second switch-board, after the first operator has made the connection with the second board and before the second operator has answered; and thirdly, at the station of the party called for, after connection has been completed. To avoid neglect on the part of the second operator, the

annunciator circuit between switches is so arranged that the operator at the first switch can continue to signal the second operator at will by merely depressing the proper key, and thus insures attention to the call; while, if there be any misunderstanding, special circuits are arranged whereby the operators may use their regular switch telephones to converse between themselves. Indeed, all conversation between operators other than over these special circuits is prohibited, and in practice there is found little occasion to use this device, as each operator has a complete list of subscribers with the switch letter set opposite the respective names, and, while she becomes familiar with the switch letter of the whole list, has, of course, only to remember the "calls" on her own board. It was feared at first that subscribers would object to giving the order twice. Experience, however, is the reverse of this, and the plan is especially commended as it enables the party calling to know what is being done at the central office and judge of the celerity with which the desired connection is made.

As the operators never leave their tables, and no tickets or other written orders are carried from switch to switch, it is evident that the system will work equally well whether the switch-boards are a foot or two miles apart. For exchanges of one hundred wires, or where more than two switch-boards are required, it cannot fail to give satisfaction, as avoiding all confusion in the central office and being the most speedy and correct means of giving orders and making connections; in fact, it is almost a duplicate system, and in an exchange of mixed wires has the advantage over a duplicate system that each operator has to remember only the calls on her own board. It is equally applicable to an exchange of two thousand wires as it is to an exchange of four hundred wires, it being necessary only to provide an additional switch-board for each 25 or 50 wires, as the case may be. The system is being patented in the leading countries of the world, and has been emphatically indorsed by every one familiar with telephone exchange systems who has examined its practical working. Mr. Fredk A. Gowen, who has made a critical examination, pronounces it the most complete system in the world.

Two devices adopted by the Providence Company, for looping the central telephone office in circuit without grounding, are worthy of notice. The first, which has been applied to nearly all the switch-boards, is being patented by Mr. Henry W. Breckenridge. It is an adaptation of the Snell spring jack, which has been previously described in these columns, and consists of a cam, which can be moved back and forward by means of a lever, two springs placed in front and back of the cam, respectively, and a metallic bar or connection, against which one of the springs comes in contact when not connected with the cam. When the lever is turned forward (its normal position) the cam, which constitutes one terminal of the line, comes in direct contact with the spring, which is the other terminal of the line, thus completing the circuit. When the lever is turned backward the spring upon which the cam rested in the first position follows the cam in its backward motion until it (the spring) comes in contact with a bar which forms one leg of the telephone circuit. At the same time the cam is brought in contact with the spring on the back side, which forms the other leg of the telephone, thus causing the current to pass directly from the cam (line) through the spring to the telephone, thence to the bar against which the spring rests, which is the other end of the line. By this arrangement both legs of the telephone are applied to the line before the original line circuit is broken, which is obviously a very important feature.

The second device for this purpose is the invention of Mr. J. F. Hedge, an employé of the company. It has been applied to some of the wires in the Providence office, and to the entire boards in several of the smaller offices. It consists of two pairs of springs for each wire, one pair being set entirely within the other, in such a manner that by the insertion of a non-conducting wedge between the outer pair of springs, which are in the main wire circuit, the springs are pushed apart and against the two inner springs, which are the terminals of the telephone circuit, thus causing the main current to pass through the telephone until the

wedge is removed, when the two outside springs close together in normal position. Both devices work very well, and there is little or no difference in the expense.

The whole exchange system is easily applicable to switch-boards of any manufacture, and it will repay the larger exchanges or those contemplating alterations to examine it thoroughly. Visitors are cordially welcome at all times, and any information will be cheerfully furnished upon application to J. W. Duxbury, Supt. of the company.

#### Brudder Johnson on 'Lectricity.

"Speakin' ob 'lectricity," said the Rev. Plato Johnson in a moment of confidence to our special reporter, "it 'pears to me dat dare ought to be some way foun' out so dat you need'n come into personal contact wid de current. Mr. Edison tole me it can't go froo glass; but den, 'don' yer see, a man can't cork hisself up in a glass bottle all de time, so he need'n be struck wid lightnin'. De fac' is, an' dat's wat I tole Mr. Edison, 'lectricity, in de present stage ob progress, is like a wild hoss ob de prarys wat has been caught, but nobody has put de harness on him yet. Now puttin' de harness on is a job wat not ebberybody is willin' to undertake. You 'proach de front end ob de hoss wid de kindest intentions, wid a bridle in yer han', an' unless yer wants to die sudden, wid considerable caution. Still, you find a look in his eyes dat don' give you de 'pression dat he returns yer 'fection. You muss be able to step about putty lively, cos a animule ob dat kind has de 'bility to turn roun' an' present de odder end, de total 'pravity end, in de twinklin' ob an eye, an' ef he does, wy, you is likely to fin' yerself trabblin' froo space like a 'spress train bein' time, an' wen you land on de odder side de fence you is mity glad somebody build dat fence, an' put it rite down 'tween you an' dat hoss. You feel as though you wish dat hoss had nebbe been born, or as if you wished hosses, specially wild ones, was made wid only two legs, and dose both front ones. Now, den, dat's de way wid lightnin'. Some people is specially 'dapted to handle it, but I don't 'long to dat class. I kin preach an' show de sinner de bottomless pit till he smells de brimstone all ober de church, but wen it comes to chain lightnin' jest cotched an' runnin' loose without any halter on, well, a I can say is dat I'd rather be 'scused, cos I has a large family, an' dey needs me a little longer on de yearth.

"De odder day Mr. Edison he says, 'Brudder Johnson, I show you de 'fect ob dis current on one ob de lower orders ob creation. You see dat cat yander?' I says 'yes, Mr. Edison, I certainly sees a cat dere, an' a beautiful Moltese it is, too.' I went up an' stroked dat pore cat in a 'fectionate sort ob way, till at lass Mr. Edison say he were ready. He put a bowl ob milk down on de floor, an' den he put one wire in de milk and leff de odder on de floor where de cat be sure to tread on it, you see? Dat Moltese 'proached dat milk kinder slow like, ez though she 'spicioned dat Mr. Edison wasn't a man to be 'tirely trusted. At lass, just though she come to de 'clution dat no mortal man could be mean 'nuff to play a trick on a pore cat, she began to lap dat milk. You know what happen? You ebber see such a ting as dat? Well, my sympathies was wid de cat, but I couldn' do nothin.' De 'speriment was in de interest ob de science ob de nineteenth century, an' I rather de cat take de dose dan me. De minnit de tongue tetch dat milk about a hundred thunderbolts went rite through dat cat. I never was so scart for a few seconds in all my life. I heard a meaw dat sounded like a anvil chorus ob all de Moltese cats in de universe. Wid ebbery hair standin' on end, wid her back all humped up like a camel, wid her tail es large es de brush ob a fox, dat Moltese was in de air 'way up 'bove our heads. Wen she struck de ground she continued de concert an' broke for de doores though she had no hopes ob life so long es she stayed in dat buildin'. 'You see dat?' says Mr. Edison. 'Well, I says, 'I thought I seed somefin in de air for a minit'. I guess dat cat is convinced dat homoeopathy is de only way to take 'lectricity. Will she ebber come back, do you tink?' 'Nebber,' says Mr. Edison, 'nebbber.' 'Den,' says I, 'de man wat says dat a cat aint a reasonable human bein' don't know what he's talkin' 'bout. An' ef de cat knows nuff nor to try dat

ting a second time, do you tink I knows less dan she does? I shall foller dat cat an' let lightnin' alone for de futur' an' keep my rheumatiz.'"

#### Look Well to What You Eat.

That the ordinary diet of to-day does not contain the necessary elements to keep the body and mind in health, under the strain of this, the 19th century, is not as generally understood as it ought to be; yet it is a very important and well-established fact, and one that is exhibited in the tired look upon the face of almost every man, woman and child we meet. The importance of securing to the diet the necessary repairing elements that our business or profession demands, together with a condition that insures the entrance of these elements into the blood, even in the presence of a weak and debilitated digestive function, cannot be over-estimated. The undersigned manufactures a series of food from the three great life staples—beef, wheat and milk, especially and scientifically prepared to repair the loss of energy incident to any business or profession, thus securing health to both body and mind. The foods do not conflict with any medicine, and are exceedingly palatable, small quantities taken with the meal, a fifty-cent package furnishing the desired elements to an adult for one week. Packages from fifty cents to two dollars. Write for free pamphlet, and give briefly condition of stomach, also occupation, and we will inform you by return mail of the kind of food required, with prices, etc.

Address, THE BLANCHARD MFG. CO.,  
—Adv't. 27 Union Square, N. Y.

#### Telegraphers Should Organize.

To the Editor of The Operator:

SIR:—Labor and capital are allies. Therefore, it is necessary that they should be on friendly terms. Each is dependent upon the other. Neither should be allowed to encroach upon the rights of the other. But it is not so in the telegraph business, at the present time, simply because the operators have no organization for the protection of their rights, like the locomotive engineers, stonecutters, and other workers.

The directors have been active in watering their capital and devising means for the reduction of expenditures in every way possible, in order to pay dividends on the inflation; while the operators have been practically idle. As suggested by "Bon Soir," recently, the time for action has arrived and should not be neglected. But the individual action he urges cannot accomplish the purpose. Therefore, the operators of the country must organize in self-defense, or submit to further oppression.

In 1864 the capital of the Western Union Telegraph Company was watered from eleven millions to twenty-two millions, by declaring a stock dividend of one hundred per cent. These added millions were pure water, and soon became a serious drag upon the company, the full weight of which was realized when the Western Union came to acquire the leading telegraph lines of the country. Thus, in the process of consolidation, the Western Union capital had to be increased to forty-one millions; when, in fact, but for the watering process, it would have been at most twenty-five millions.

With a capital sixty per cent. in excess of a just valuation, it became necessary to resort to the most vigorous retrenchment, the chief burden of which had to be borne by the employes. These measures enabled the company to pay small dividends up to and including 1869, when they ceased until 1874, after which time the earnings rapidly increased. In 1879 a regular yearly dividend of seven per cent., an additional cash dividend of one per cent., and a stock dividend of seventeen per cent. were declared, making a total dividend of twenty-five per cent. for that year. The six millions or more composing the seventeen per cent. stock dividend had been held in the treasury, and should have been canceled to reduce the over-capitalization. But as it was not done, the watering process repeated in the last consolidation was thereby rendered proportionately greater than it would otherwise have been, and now they have the enormously inflated capital of eighty millions upon which dividends will be exacted. Judging the future by the past, we have no assurance that this water-

ing of stock and absorbing of rival telegraph lines are to cease.

With an honest capital based upon the actual cost of the Western Union property, for which fifty millions is a high valuation, the company could then earn handsome dividends, keep their property in first-class condition and pay their employes just compensation, proportionate to the ability, faithfulness and labor required in the performance of good service. At present operators, with few exceptions, are overworked and not sufficiently paid to enable them to live comfortably; and consequently many of them are physically unfit to perform their arduous duties properly. Is it right that they should be thus oppressed to earn usurious interest on fictitious capital? Although the officers of the company claim that they are not reducing salaries, they have been doing so for years past, in pursuance of their unjust policy of filling vacancies by promotion from lower grades without a corresponding increase of salary, so that a promoted operator doing the same work as his predecessor seldom or never succeeds in getting the same salary; and by that means the company is constantly reducing salaries. Such a policy is certainly not calculated to call forth the latent energies of embryo operators, since it offers so little inducement for them to earn promotion by becoming experts.

The true interests of the employer and employee should be identical, and when the latter is properly compensated his interest in his work naturally increases and makes his service of proportionately greater value. This principle has been ignored by the Western Union. Is it likely that they will change their policy in the interests of justice unless they are compelled to do so? The organization of Locomotive Engineers has demonstrated that organized labor can not only protect itself and secure just compensation, but can also increase the efficiency of the service and command respect. Have telegraphers energy, faith, patience and courage enough to organize for their protection and advancement, or are they content to submit to whatever organized capital may dictate?

If they "will organize," it should be for the purpose of establishing and maintaining a just basis of compensation. The service should be graded and salaries adjusted to each grade. Promotion to a higher grade should be invariably accompanied by the salary for that grade. No discrimination ought to be made on account of sex. Female operators should receive the same salary as male operators in the same grade.

I believe that the application of these principles would remedy the existing evils to which operators are at present obliged to submit; and would undoubtedly be the means of improving the efficiency and elevating the dignity of the profession.

JUSTITIA.

NEW YORK, Nov. 8., 1881.

#### Commissions of the G. N. W. Agents.

To the Editor of The Operator:

SIR: I have noticed in your interesting paper lately a great deal of complaint about the Western Union reducing salaries in nearly all parts of the United States, but have very seldom, if ever, noticed any remarks derogatory to the Montreal Telegraph Company's management. You, of course, knew that the universal tariff of the M. T. Co. from one office to any other in the Dominion was 20 and 1, regardless of distance. Nearly all of the agents worked on a commission of 25 per cent. on amount of business done by their respective offices. This was the case before the amalgamation which has proved so unsatisfactory to all persons doing business over the wires, and is likely to prove detrimental. The first move made by the Great Northwestern Tel. Co., after assuming control of the M. T. Co.'s lines, was to raise the tariff from 20 and 1 to 25 and 1 and do away with red or night half-rate messages. This looked at first like proving beneficial to the agents, nearly all of whom work on a 25 per cent. commission, and the more so when instructions were given to check direct with Western Union offices. But, alas! before the hopes could be realized the Great N. W. issued circulars stating that commission would only be allowed at 20 per cent. on Great N. W. business and 8 per cent. on business done with Western Union offices. Heretofore, on through messages—Boston, for instance—the tariff was 20 and 20, so that agents got a commission of 25

per cent. on 20 cents for this line—5 cents—whereas now they check direct with Boston, tariff 40 cents, commission 8 per cent., making 3½ cents—a loss of 1½ cents on each message for the agent, and consequently so much gain for the G. N. W. treasury. The amount is small on one message, but taking a large number in the course of a year, it very materially lessens the already small enough remuneration allowed. Anyone can see that the only gainer by this change is G. N. W., and the agents can sympathize with the public, and *vice versa*. Certain men, however, have recklessly dared to band themselves together, and formed the "Canada Mutual Telegraph Company" in opposition to this mighty monopoly. I can see no reason why they should not succeed in securing the services of good operators, who have the confidence of the public, and who are much dissatisfied with the manipulations of the G. N. W., and would willingly enroll their names with the "Canada Mutual;" thereby, if not benefiting themselves financially they would, at least, show the public that they do not encourage or uphold the G. N. W. in its endeavors to take advantage of the public.

H.

### Montreal Notes.

To the Editor of The Operator:

SIR: There has been considerable change in the Montreal office since the Great Northwestern has had the operating of the Montreal and Dominion companies. All the Dominion operators have been transferred to the Montreal office, with the exception of Messrs. Dempsey, O'Leary and Noble, who left for New York soon after the amalgamation. There are 15 ladies and 32 men on the day staff and five night owls. The day force is still presided over by Mr. J. R. McPhee as manager, J. S. Mackenzie as assistant manager and A. T. Nurse, "wire chief." The quad. lately put up is worked with Toronto and operated by Messrs. William Gibson and Louis Meloche on one side and W. H. S. Brady and Johnnie Wilson on the other. The market wire is worked by Mr. R. C. Pennie; Detroit wire by Mr. J. Clandining; Buffalo press wire by "Tom" Rogers, and Boston by J. R. Duggan. We have four sets of duplex—Quebec, operated by Sam Trenaman and George Washington Jolly; St. John, N. B., by E. McConnell (Saturday night chief) and Alex. Lanskill; Ottawa, by George Turner and Fred Jennings; New York, G. T. Boulet (late Dominion day chief) and W. J. Camp (his late assistant). The night staff is still under the management of Mr. Jas. Kent, with Dalglish as "Buffalo man" and Tom Robinson, the night press sender. The boys make considerable fun of the quad. The Mutual Union is expected to turn out good things in the spring for those that have still a little ambition left. The cable has been laid across the river, and they expect to have N. Y. "straight" by the first of January. The receiving room has been greatly changed. The wickets have been taken down and an open counter put up in their place, which adds greatly to the appearance of the office. The audit department has been transferred to Toronto, which is the head office now. The business has been pretty heavy since the amalgamation—1500 to 1600 have been the average between Toronto and Montreal during the last two months; but since the close of navigation it has been getting a little slack. The boys now look forward to the opening of parliament for heavy work, as all the report is expected to be done on these wires. Montreal boasts of a snow-shoe club, formed by the employees of the G. N. W. T. Co., which will be a great source of amusement to the "boys," and is called the "Electric S. S. Club."

CANADA.

### Baltimore Notes.

To the Editor of The Operator:

SIR: At a meeting of Brotherhood of Telegraphers, held Nov. 21, the name of the association was changed to the "Telegraphers' Beneficial Association." As the objects are purely beneficial, the change is very appropriate. Baltimore operators propose to establish a fund from which sick and distressed members will be assisted. The association numbers 30 members. Prosperity has dawned upon the old-timers in the W. U.; their salaries have been advanced from \$5 to \$10 per month. Of course, there will always be "soreheads." There is no question, however,

but that Manager De Bree has done all in his power to ameliorate the condition of operators, and if there are any wrongs, it is certainly his disposition that they should be righted. Both from Mr. De Bree and Chief Bloxham nothing but justice can be expected, so far as it lies in their power to secure it. E. H. Cole, better known as the bachelor operator, after an absence of several months in Virginia, has landed at "G. H." May he tarry long. S. H. Chambers, of the B. & O. R. R., at Locust Pt., has resigned, and gone to New Orleans. T. P. Stephens succeeds him as night man. Among the new faces at Union Station we notice Messrs. North and Heathcote. The force now consists of Messrs. Taylor, Weirs, Galloway, North, Heathcote and Brady, all fine operators. Ward and Remy are at Calvert Station days; Joe Kelly is night owl. The Mutual District Telegraph Co., of Baltimore, is the latest solicitor of patronage, having opened several offices recently. The company will do business over the wires of the Mutual Union Co., which are almost completed, and will open for general business West in a few weeks. A description of the M. U. office will appear in a future issue of THE OPERATOR. G. F. West is the able and efficient General Manager of the Mutual District, and will, no doubt, prove himself—as he has on previous occasions when connected with the American District Co.—a great worker of the new company.

BALTIMORE, Nov. 22, 1881.

EXCELSIOR.

### Indianapolis Notes.

To the Editor of The Operator:

SIR: Business continues heavy, though somewhat abated since August and September, and the night boys are still on the rampage for extra. There is a lively scuffle every night after "30" among them to see who sleeps in the manager's chair, so as to report early the next day.

Several changes have taken place since my last. Mr. Lew Custer has gone back to St. Louis and is now working the Indianapolis quad nights, with "Fatty" Lee at this end. Mr. Ed. Delany has gone to Louisville. Messrs. Mat. Leonard and Con. Sullivan have gone to Pittsburgh. Mr. Tim. Sullivan started westward several days ago and has turned up in Kansas City. Messrs. Blanchfield, Shorten, Dewese and Brown have gone back to former vocations—railroading. Mr. James Dietrick, one of our best men, has accepted a position on the Bee line in this city, and Mr. J. MacClure has resigned to fill a short vacancy in the Union depot office. Pat. Folley has also resigned and gone to Terre Haute.

Arrivals: Mr. A. H. Van Landingham, from Chicago; Harry Nichols, Cincinnati; Wat Crow, Greencastle; W. S. Bremer, Chicago; and Mr. Butterfield, also from Chicago. Mr. Carpenter, from Chicago, is here working extra for a few days. Miss Hollister, from the J. M. & I., is a very acceptable addition to our force of ladies. She is working regular extra. Mr. McIntyre has returned from an extensive visit in the East.

It is understood that the Mutual Union will reach Indianapolis about the 1st of January. It is not known who is to take the reins here. Competition at this point, to be successful, must have at its head a thorough business man. Our office is in every respect first-class, and business men of the city seem to appreciate the prompt and efficient style we have of doing business. Nevertheless, there is business enough originating at this point to support two or even more companies, and the Mutual Union will be heartily welcomed by our men. It is also understood that the *Journal* is to have an exclusive wire to Washington. This is indirect information, though from a good source.

WHIF.

### Omaha Notes.

To the Editor of The Operator:

SIR:—Business in Omaha office has fallen off but very little during the past month or so, and there are but few changes to note in the operating room. Mr. Frank Williams has just arrived from Chicago, and will this time make it a permanent stay. Mr. Williams is one of the finest operators in the West, and the management does well to secure his valuable services. Mr. Huey left us, prior to Mr. Williams' arrival, for his old home (Ogden, Utah).

Messrs. Stone, Foote and Langdon have left us and are now working in Kansas City.

A. H. Mayne is spending his vacation of six weeks with friends and relations in Ohio. Rodney Tyler, formerly of 'Frisco, was also recorded as taking a short vacation and surprised his many friends by bringing home a "blushing bride."

"The Brotherhood" are quite completely organized here, and the utmost harmony and good feeling prevails among its members. New members are constantly being added to its roll, and the outlook is indeed an encouraging one. Miss Brady, of the Western Union office has been seriously ill, but is now convalescent. The Western Union operators were very attentive and kind to her while ill. The boys have all agreed to give one of their extra nights in the week to Miss Brady, and thereby allow her to draw her salary. As a general thing the Omaha force have contributed liberally and generously to every worthy object presented to them.

Mr. M. C. Bristol, Assistant W. U. Superintendent of Construction, is building an additional wire between Omaha and Cheyenne, which will probably be used duplex between Omaha and Denver, as present facilities for the latter-named place are not sufficient for the rapidly-increasing business.

Himebaugh & Merriam's grain elevator office has now a direct Chicago wire. Charley Woodman is the manipulator.

O. M.

### The Boyce Fund Completed.

To the Editor of The Operator:

SIR: I have this Thanksgiving Day received from Mr. A. R. Brewer, Secretary of the Telegraphers' Mutual Benefit Association, his check for \$20.50, the remainder of the voluntary subscriptions of the friends of my late husband. I am very anxious to express to THE OPERATOR, and through it, my sincere thanks to the telegraphic fraternity, for their kindness to me and my orphan children.

AMANDA M. BOYCE.

MOUNT HOLLY, N. J., Nov. 24, 1881.

## TELEPHONE DEPARTMENT.

The Magnet Telephone Co., of New York, was formed at 234 Broadway, Nov. 17.

The Western Telephone Dispatch Company's line, of No. 14 steel, twenty-one miles in length (said to be the longest steel wire line in this country), twenty-one miles from Atchison, Kan., to St. Joseph, Mo., is reported to be working splendidly.

Nearly every telephone man will want to make presents at Christmas. "Wordsworth," "Christmas Evergreens," "Tales and History" or some of the other books advertised in this issue, will be found particularly appropriate for the purpose.

Experiments lately performed with telephones during thunder-storms showed that on the occasion of every storm, near or remote, the flashes of lightning were accompanied with a very characteristic sound in the telephones at the same instant that the flashes of lightning were seen. The wire was evidently affected by induction.

The switch-boards described as in use at Providence, R. I., by Mr. J. W. Duxbury, were made by Messrs. Post & Company, Cincinnati, Ohio, under their patents and the patents of Mr. A. G. Snell, of New Haven. Messrs. Post & Company are ready to make estimates or furnish any number or sizes of such boards as may be required for any sized exchanges.

Referring to the progress of the telephone in Australia, the *Sydney Mining Herald* reports some experiments which have been made between Melbourne and Albury, a distance of 200 miles, and between Sydney and Parramatta "with the most satisfactory result, the conversation carried on between these places being as distinct as that of two persons in the same room."

The practical advancement in telephoning, as in early telegraphing, presents a wide field for thought and improvement. We are standing on the beach of present attainments, while the sea of possibilities lies stretched in one vast, unbounded expanse before us. The thoughtful, inventive mind peers into and penetrates the mist which envelops this great sea of human possibilities, bridles the lightning's flash and

makes it do his bidding, sending pulsations night and day the world around.

Messrs. Balch & Root, American Bell Telephone licensees for Carroll and Whiteside counties, Illinois, have invented a new appliance for underground work, so as to use naked wire, dispensing with cables or insulated wires. The system is said to work well, with small induction and perfect insulation. The material is a secret, but is cheap and practical. With it 100 wires can be grouped in a radius of two feet. As soon as their patents are perfected the inventors propose to introduce it for more general inspection.

M. Landerer, at Tortosa, finds currents produced in his telephone circuit by atmospheric electricity in three different ways. First, the condensation of aqueous vapor results in a sound recalling the cry of tin. A sensitive galvanometer in the circuit is not, or hardly, affected. These sounds are strongest at night. Next, there are the sounds which occur during lightning (and the currents producing which affect a galvanometer considerably). Thirdly, the wind generates currents which do not act on the telephone, but act on the galvanometer strongly.

Testimony is being taken at Harrisburg, Penna., to show that Daniel Drawbaugh, who lives near that city, invented the speaking telephone before Professor Bell, and that he was prevented by poverty from perfecting the instrument. Drawbaugh's invention is owned by the People's Telephone Company, and from the evidence taken the company believe it will enable them to establish priority of invention for the Drawbaugh telephone. Thus far about 112 witnesses have been examined, and probably a dozen more will testify before the case is tried in the Circuit Court of New York, where proceedings have been begun against the Bell Telephone Company by the People's Company.

Telephone interests are well represented in Portland, Me., and the genial manager, J. H. Farnham, is alive to the situation. It does one good to enter the busy office, containing about 12 tables and accommodating nearly 600 subscribers, operated by some six or eight bright young ladies and gentlemen who, though attending to upwards of 5,000 calls daily, move about the office as noiselessly as if it were a model school room. Mr. W. H. Lincoln is the first assistant, and the manner in which he officiates over the staff reflects great credit upon him. Everything is neatness and order, and the Williams system of cord and plug switch shows to the very best advantage here. Thirty seconds complete the average connection, which is remarkably quick when we consider that by their method each connection passes through five operations. There are about 15 suburban circuits, the longest reaching Lewiston, about 40 miles distant. Manager Farnham's ingenuity is well displayed by the numberless little inventions designed for the convenience of the office, and a visit to this exchange is well worth the trip to parties interested.

At New Haven, Conn., on the 15th of last month, suit was commenced by the United States Telephone Company of New York against the Connecticut Telephone Company in New Haven and Hartford for infringement of the patents recently issued to James W. McDonough, of Chicago, for the speaking telephone in use by the Connecticut Telephone Company as licensees of the so-called Bell telephones and battery transmitters. The application for letters patent was filed by Mr. McDonough in the patent office at Washington, April 10, 1876, under the title of "The Telelog." This was before A. G. Bell had produced an articulating telephone. It is claimed that, by the employment of incompetent attorneys, Mr. McDonough's case was greatly delayed in its prosecution before the patent office. The invention was purchased by Mr. Logan C. Murray, of New York City, about a year ago, and able attorneys assigned to press his claims before the examiner of electric patents, resulting in the issue of three patents by the Commissioner of Patents, after the most careful examination, the patents bearing dates respectively in August, September and October, 1881, and for a term of 17 years from those dates, the claims allowed fully covering the receiving telephones and battery transmitters now in general use. Nov. 1, inst., those patents were purchased from Logan C. Murray by the United States Tele-

phone Company, which brings the suit. James W. McDonough, the inventor of the telephone, is a great-grandson of Commodore McDonough.

Mr. Richard Whiteing, in describing the "Opera by Telephone," at Paris, writes as follows concerning that highly novel and interesting entertainment: "While we all stood in this attitude of expectation, one of the attendants suddenly called out 'Now.' The disks were placed to our ears and we heard through them, from I know not what infinite distance and mysterious depth, the overture to Gounod's 'Faust.' It was heard perfectly, but with some diminution of volume and intensity. It was in some respects better than at the opera, in being without the strong resonant echo. \* \* \*

And it was an immense gain to this unity of effect to hear only and to see nothing—not the frantic leader of the orchestra, for instance, the scraping fiddlers and the puffing trumpeters, and so on, nor in fact anything of the visible manufacture of an influence which we like to regard as almost divine. There was only one defect, and that a pretty serious one. In spite of the superiority in the blended sound, there was now and then an undue prominence in certain elements of it. You heard the bass, for instance, on the rare occasions, happily, on which it was used with painful distinctness. This, I learn, is because instruments of slow vibration have more effect through the telephone than instruments of quick vibration—an inconvenience that may be remedied. Then suddenly the overture ceased, and a sound like stone striking stone—say the emptying of a cart-load of macadam on the pavement—showed that the public was giving its applause. Then there was silence for a moment or two, during which we lifted our beatified faces from the wall and smiled on one another with foolish joy. But the smile soon died away from the lips of my companions as the attendants came in and cleared them off the premises to make way for the next batch. Resistance would have been useless. One could hear the murmur, fast deepening into a roar, of the starving beings without waiting for their musical food. I alone kept the disk to my ear all the while and lost nothing. There was not much to lose. It was the beginning of Faust's soliloquy, which on the stage is delivered in the low tone suited to introspective meditation, and which came to us in a still lower one. But as the dreamingscholar advanced from melancholy to desperation he was heard perfectly well. Then there was silence for a moment, and we knew that he was pouring the magic drink into the cup, and suddenly there reached us a chorus of soft yet exquisitely clear, flute-like voices. It was the choir of maidens giving the unhappy doctor what sporting gentlemen call 'the office' as to a remedy for his complaint: 'All nature awakes to love.' This was heard as well as it deserved to be for its intrinsic value as a secret of the healing art, the final *s'éveille à l'amour* ringing out sharp and clear. \* \* \* When I again had my chance *Faust* and *Mephistopheles* were concluding their infernal bargain, and the devil, perhaps as having so much the better of it, was heard the more distinctly of the two. The words seemed to have a truly diabolical signification, reaching one's ears as they did from nowhere, sounds without a sight of their source. This I should say affected the entire performance as heard by telephone, music which is essentially the delight of the spirit, and gains by being kept as clear as possible from every material association. How can one be too grateful, for instance, to a happy pleasantry at two francs a night that gives us its voice of Arcadia without its look of the Batignolles."

### DASHES HERE AND THERE.

London contains upward of 300 telegraph offices, open from 8 in the morning until 8 at night.

Rolled gold solid ring only 75 cents. Greatest offer ever made by a responsible firm. Read advertisement. G. W. Pettibone & Co.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—*Adv.*

A correspondent wants to know whether the new blanks now used by the Western Union have been highly colored in honor of Jay Gould (Gold)."

THE OPERATOR, one year, is one of the most appropriate presents that a telegrapher could make to a young lady friend—whether she be in or out of the business.

On the 18th ult. the quadruplex was successfully worked on the lines of the Montreal Telegraph Company. It worked well over a distance of 335 miles on a No. 9 wire.

The name of Col. D. C. Dodge is not a hard one for any fair operator to take, but the other day it passed through Kansas City office and was received in Denver as "Cold Clodge."

The advertisement of the Saxon Importing Company in the present issue deserves the attention of telegraphers desiring a good gun at a low price. The company is perfectly reliable.

It is said that since telegraph wires have been carried throughout Norway wolves have disappeared. It is stated that a wolf will not dare to pass under a rope or line stretched between poles.

Superintendents, managers and others who may wish to make presents to their subordinates at Christmas—and it is a pleasing custom—are invited to read our Christmas announcements in this issue.

Messrs. C. E. Jones & Bro., of Cincinnati, are anxious to get a copy of J. A. Lannert's Outline of Practical Telegraphy, price 25 cents, which is out of print. They will pay \$1 to any one who will send them a copy.

The telegraph cable ship *Hooper*, which is said to be the largest afloat, has been sold and renamed *Silvertown*. She will leave England in March to assist in laying the 3,000 miles of cable on the west coast of South America.

The second reception and ball of the Omaha telegraphers took place on Monday last, Nov. 28. As all the prominent telegraph men in Omaha had interested themselves in the affair, the evening was doubtless very enjoyably spent.

NOT A FRAUD.—Any person that uses Farnham's Armaline patiently will testify to its merits. It is a reliable cure for writer's cramp or pen paralysis. Send for circular to Brown, Pettibone & Kelly, stationers, 194 and 196 Dearborn street, Chicago.—*Adv.*

The volume of Wordsworth's poems, advertised elsewhere, is the most beautiful and appropriate present, at the price, that a telegrapher could make to a friend. Copies will be mailed—so securely done up that they cannot be damaged in transit—on any date that may be desired.

Two linemen of the Western Union Telegraph Company, named David Cronan and Wm. Dogan, were instantly killed near Vincennes, Ind., on the 21st ult. They were running a hand-car on the track of the Evansville & Terre Haute road, and were struck by the south-bound passenger train.

Messrs. C. E. Jones & Bro., of Cincinnati, have just issued a 110 page "complete illustrated catalogue and price list," in which will be found cuts, descriptions and prices of everything connected with telegraph, telephone and electrical instruments that any one will be likely to call for. Those in need of instruments or supplies will do well to send for a copy.

George W. Wentworth, a well-known resident of Salmon Falls, N. H., was shot, on the 24th ult., in the neck and thigh by E. L. Nowell, a telegraph operator at the Boston & Maine depot in that town. Wentworth's condition is stated to be critical. Immediately after the shooting Nowell gave himself up. The alleged cause of the affray is stated to be family feuds of long standing.

An advertisement of jewelry suitable for holiday presents by the well-known firm of G. W. Pettibone & Company will be found in another column.

A dispatch from St. Paul, Minn., says that President Villard, of the Northern Pacific Railroad, has made a contract with Edison for the construction of fifty miles of railroad in that State in 1882, upon which to test the efficiency of the Edison electrical engine as a motive power for railroads. Villard is to pay for the road if the experiment is satisfactory. If the test fails Edison (and the capitalists backing him), will have to pay the greater part of the costs.

The big bridge over the East River, between this city and Brooklyn, has already become a great favorite with the telegraph and telephone

companies, who prefer using it for their wires than to lay cables, which are expensive to construct and difficult to repair. The bridge trustees charge \$30 per year for every wire. The Metropolitan Telephone Company alone pays about \$14,500 per annum for this privilege, and it is said that other companies pay about \$6,000 more.

It is said that a marked improvement has been noticed in the acoustic properties of the Grand Opera House of Paris since the introduction of the electric light. A layer of heated gases acts as a screen for sound, hence the volumes of hot fumes arising from the old gas foot-lights obstructed and marred, to some extent, the voices of the singers. With the electric light, inclosed in air-tight bulbs, no fumes can be emitted, and very little heat is given off. Hence its benefits to the ear as well as to the eye.

The Altoona, Penna., *Tribune*, of November 16, says: "David McCargo, General Superintendent of the Allegheny Valley Railroad, is reported to be so seriously ill at his home at Oakmont that his death is but the question of a few hours. It appears that on his return from Europe, where he had gone with the Carnegie party, he was taken sick with rheumatism, which has caused clotting of the blood and arrested circulation. Mr. McCargo commenced life as a messenger boy for the old United States Telegraph Company. His tact and executive ability secured his rapid promotion, and a few years later he was superintendent of the Atlantic & Pacific Company, from which he went to the Allegheny Valley Railroad, and within a few years enjoyed the reputation of being one of the best superintendents in the country. Mr. McCargo has a wife and two children, a son and a daughter, and is about 45 years of age."

The *Engineer* reports that the system of underground telegraphy devised by Dr. Stephan, the Postmaster-General of Germany, is now complete. On March 14, 1876, the first line of cable from Berlin to Halle was commenced, and on June 26, 1881, the work was completed by the laying of the cable from Cologne to Aix-la-Chapelle. In 58 months 18 lines have been laid, comprising 3,394 miles of cable, costing 30,200,000 marks. The 18 lines connect 221 towns. The weight of the cables is 12,825 tons. German main lines are no longer in danger of being effected by wind or snow or ice. In France a similar system is adopted between Paris and Marseilles. The trenches for receiving the iron pipes in which the cables are laid are nearly four feet deep. These cables contain three conducting cables, with seven conductors in each, giving thus 21 conductors altogether. Facilities for examining the cables and repairing them are provided at distances of 500 metres.

It has sometimes been thought, says *La Lumière Electrique*, that a copper cable of enormous thickness would be required to transmit the hydraulic power of Niagara Falls to New York. Prof. Ayrton has shown that the whole power could be transmitted by a slender copper wire, provided that the wire could be thoroughly insulated. He has also shown that the only hindrance to receiving the whole power is the friction of the machines. It is, therefore, believed that immense machines, with continuous currents, with detached exciters or magneto-electric machines, driven very rapidly by steam-power, will hold a very important place in the future transmission of energy. With such machines it would be possible to warm and light workshops and give them the power necessary to move all their machinery by means of an ordinary telegraph wire, thoroughly insulated, and conveying energy from great distances. Prof. Perry also thinks it will some time become possible to see what is going on in remote places by means of electricity.

Telegraph operators, especially those who "change off" between day and night work, suffer from weak eyes, probably, more than men in any other profession. Those also who, as most operators do, work around an office, first at one table and then at another, suffer unconsciously a tremendous strain on the eyesight, principally from continually changing the range at each table between the eye and the paper, which calls for an unceasing effort to keep the eye in due accommodation for the varying object. Night men who work by the intense glare of an artificial light make steadily increasing

demands upon the organ of vision, no symptom of weakness in which should be neglected for a single day. These trying cases, in all their variations, are provided against by scientific opticians, who can give directions for working in strong artificial lights, twilight or sunlight, with the relative merits of glasses, cobalt green, blue and white, and shades of all descriptions. Those who are desirous of investigating the subject, with a view of preserving or improving their eyesight, we refer to our advertisement of Messrs. R. & J. Beck, 1016 Chestnut street, Philadelphia. Their circular deals with the subject fully, and may be the means of averting much trouble in years to come.

Mr. Alden, the funny man of the New York *Times*, has the following to say of the so-called electric brushes so freely advertised: To all appearance it is like an ordinary brush, but in its bristles is stored up an inexhaustible supply of electricity. How this electricity is put into the bristles is not known. Perhaps they are soaked for twenty-four hours in a pailful of electricity, or perhaps electricity is forced into them by heavy pressure. At any rate, the electricity is in them, and it is practically inexhaustible. As everybody knows, electricity is a specific for headache, no matter from what cause the headache may arise. Doctors have hitherto administered electricity by the spoonful, or in the shape of pills, but its unpleasant taste has rendered it unpopular with delicate patients. The electric hair-brush supersedes electrical pills and draughts. If you have a headache all you have to do is to induce some one to brush your hair with an electric brush. You will neither taste nor smell the electricity, but it will soak through the scalp and skull, and on reaching the brain will instantly cause the headache to cease. This is surely better than swallowing nauseous doses of liquid or solid electricity, which delicate stomachs often are unable to retain. There is abundant testimony to prove that the electric hair brush is as beneficial and infallible in its effects as are the liver, stomach, lung, kidney, spine, shin, and back-teeth pads that are in such universal use, and the sneers of the doctors who call themselves "regular physicians" cannot injure it in public estimation.

The following is a *verbatim* copy of an application recently received by a Western superintendent:

"Mr. woods I would like to Have A night office on your line I Have Ha considerable practice One the lines Have Been at the Buisnes for 5 months and few day over I have bin on a farm all my life untill I commenced This buisniss And I pritind to Be sober and industrious But Never Have Been employed By R R co So of course I Have no papers as regard my good qualites all i ask for is to try me I think That I can make good satisfaction in small Night office I can receive 20 per minute word when it is well sent But i probably be some wat Bothered in the start But can get along and make good satisfaction i thing 29 yers old Ohio my native State Please answer soon inclosed find stamp."

Another Eastern applicant, who thinks he "could soon learn to climb poles and fix breaks," but acknowledges that he is "not a good sound operator; in fact, was always used to the register," adds—we give his postscript *verbatim*:

"P. s.—I can climb a tree now without them stickers that the men have on their heles and I have no doubt I would be a first-class operator in a cupil of months in a quiet plase where there is no noise what selery can you offer me to start in on remember sir I can take 8 words a min. if sent slow and is that fair speed on a telegraph wire by sound if so I am ready and hope you will file my application and give me the first vacancy."

## NEW YORK CITY ITEMS.

### Echoes From 195.

Mr. W. F. Lewis, late of 195 Broadway, N. Y., is now in the Richmond, Va., W. U. Office.

Mr. Wm. Maver, Jr., has been elected Secretary of the Telegraphers' Aid Society, *vice* Mr. J. W. Moreland, resigned.

Everybody is complaining about the bad ventilation of the crowded operating room, and many of the employes only manage to worry through the allotted time of service by a desperate struggle.

Assistant General Circuit Manager Fenn has returned from Pittsburgh, after having exterminated the "bugs" in that office. "Joe" is a favorite with the operators at 195, and is as courteous as he is competent, and that is saying a great deal.

The *Paris* (Ill.) *Gazette* says: It will be remembered that Mr. George Cumming was telegrapher for the I. & St. L. Ry. here in 1869-70, and was highly esteemed by all who knew him. His many friends here congratulate him on his success as an inventor.

The Hon. Jeremiah Borst, Colonel Weller, Elder Bob Morris and other magnates of the operating force must hereafter discontinue the pernicious habit of standing in front of the Western Union Building and familiarly bowing to Governors Morgan and Cornell, Jay Gould, and other Western Union dignitaries.

"I think the night men on the Chicago wire take me for a new man," remarked Denis Brown to Chief Kennedy the other evening. "How is that," inquired the Chief. "Well, one of them just slipped a message of 150 words before me and told me to send it to Chicago." "What did you do?" "I just slipped it back," said Denis, and told him he couldn't come that on me, for I had been playing the same game myself for the past seven years."

### Other City Items.

Mr. Van Hovenbergh has sold his stock printing instrument to the Gold and Stock Telegraph Company for \$10,000.

At the next meeting of the New York Electrical Society, which occurs at No. 64 Madison avenue on Wednesday evening, Dec. 7, Mr. H. W. Pope will read a paper, on "Permanent Wire Ways: Aerial and Subterranean."

Mayor Grace has vetoed the aldermen's resolution granting permission to the Metropolitan Telephone & Telegraph Company to lay wires under the streets of this city. He thinks one cent for each lineal foot of street occupied is not enough for the privilege, and that the Metropolitan Company should be compelled to pay a fair price for the franchise.

At a meeting of representatives of the Brush, United States, American, Fuller, Weston and Jablochkoff electric companies in this city last week, in the office of the Gramme Electrical Company, it was decided to enforce to the fullest extent their patent rights against infringing companies. A committee was appointed to act with the Board of Fire Underwriters in making an exhaustive investigation of the alleged danger of fire from the use of the electric light.

Since the general meeting of the Telegraphers' Union, held on Sunday, Nov. 13, applications for membership have been pouring in. Almost every first-class operator in the city is now a member of the Union. The modification of the application for membership has so enlarged its latitude that operators residing in small towns where their numbers are insufficient to form a separate branch may become members of the New York Union. Those having that object in view will receive a copy of the constitution, etc., upon application to any of the members. The officers hope that all operators will identify themselves with the organization as soon as possible.

At the meeting of the New York Electrical Society, on Wednesday evening Nov. 16, Mr. Charles S. Small, Assistant Superintendent of the Gold and Stock Telegraph Company, read a paper on "The Novelties of the Paris Electrical Congress." After praising Edison for his important, numerous and varied exhibitions, Maxim for his powerful arc lights and George Cumming for a new telegraphic key with peripheral contact, Mr. Small proceeded to describe the novelties. A microtasimeter was explained, which is so delicate that it will measure the calorific rays emitted by the fixed stars. An electromotograph, somewhat similar to the telephone, was said to possess greater intensity than the telephone. Electric motors for balloons were described which possess the advantage of having the balloon carry its own motive power. Uniform time-keeping by the electric current, photography by the aid of the electric light, and an automatic weather recording apparatus were explained, after which several members of the society discussed the merits of the paper presented.

W. J. JOHNSTON'S

## CHRISTMAS ANNOUNCEMENTS.

No. 9 Murray Street, New York City.

From poem "On the Extinction of the Venetian Republic."

POEMS OF WILLIAM WORDSWORTH: Edited, with an Introduction, by Richard Henry Stoddard. 320 octavo pages. Elaborately illustrated and superbly bound. Gilt edges. Price, \$3.

Herewith is announced a new edition of the poems of William Wordsworth. In this country, as in England, the poet of Nature is steadily gaining in popularity. As a rule, the age of newness and curiosity being passed, every fresh reader becomes a friend and admirer of such poetry as his, which "wears well." Those who have once taken a drink from the pure, cold fountain of Wordsworth's inspiration will often return thereto, to cool the heat of life's fever. The writer remembers his first introduction to the greatest poet of the century. He was a school-boy then, under a preceptor of a just literary taste, who permitted him to know what were the books at the time engaging his attention. At the epoch referred to—for it proved to be an epoch in the individual history of him who pens these words—a volume of Wordsworth's Sonnets was among the literary treasures on the master's desk, and the pupil read the divine apostrophe to Milton:

"We are selfish men;  
Oh! raise us up, return to us again;  
And give us manners, virtue, freedom, power.  
Thy soul was like a star, and dwelt apart;  
Thou hadst a voice whose sound was like the sea:  
Pure as the naked heavens, majestic, free,  
So didst thou travel on life's common way,  
In cheerful godliness; and yet thy heart  
The lowliest duties on herself did lay."

These words placed one more disciple at the feet of a prophet who perceived and felt above all others the deep harmonies of Nature—their power to soothe and heal, to chasten and subdue the passions, to refine and to endow with an abiding happiness. From that time to now, every day spent without some companionship with Wordsworth has seemed to be an imperfect one.

No poet is more tenaciously admired than Wordsworth, and no poet has been the subject of more flippant criticism. The distinction between "is" and "has been" in the preceding sentence is one well considered. Wordsworth's poetry has survived the attacks of small wits, and is ranked among the best which gives an unmatched distinction to English literature. The critic can now write Shakespeare, Milton and Wordsworth as the greatest names in English verse, and his judgment is not the subject of a sneer. [Fifty years ago this estimate, which is extensively and in-

creasingly accepted, would have been received with surprise, if not with contempt. Wordsworth's poetry has proved like gold tried in the furnace.

Admitted that Wordsworth, like the most of people, had a crotchet. His earlier poems were distinguished by an affectation of simplicity as to subject and style, which his ingenious defense thereof failed to justify. But his genius survived an inconsiderable weakness of its immaturity. The English language has rarely reached such copiousness and majesty of diction as in many passages cullable from the works of the Lake poet. For example:

"Within the soul a faculty abides,  
That with interpositions, which would hide  
And darken, so can deal, that they become  
Contingencies of pomp, and serve to exalt  
Her native brightness. As the ample moon,  
In the deep stillness of a summer eve  
Rising behind a thick and lofty grove,  
Beams like an unconsuming fire of light  
In the green trees; and, kindling on all sides  
Their leafy umbrage, turns the dusky veil  
Into a substance glorious as her own,  
Yea, with her own incorporated, by power  
Capacious and serene—like power abides  
In man's celestial spirit; Virtue thus  
Sets forth and magnifies herself; thus feeds  
A calm, a beautiful and silent fire  
From the encumbrances of mortal life,  
From error, disappointment—nay, from guilt;  
And sometimes, so relenting Justice wills,  
From palpable oppressions of despair."

The enthusiasm of a steady admirer is perhaps excusable, even when it leads him to deprecate the omission from any edition of Wordsworth's works of the poems which so wonderfully exercised the pleasantries of certain critics upon their first appearance.

"Happier far  
Could they have lived as do the little birds  
That peck along the hedges, or the kite  
That makes his dwelling on the mountain rocks"

There must be more than their simplicity to account for the wonderful popularity of "We Are Seven," "Lucy Gray," "The Pet Lamb," and other early pieces printed and beautifully illustrated

in the edition suggesting these remarks. The truth is that their deep undercurrent of thought and feeling influences the popular judgment beyond the carplings of verbal critics with their musty precedents. While "Tintern Abbey" and the "Ode on Immortality" are, of course, infinitely out of the reach of petty criticism, the detractors of Wordsworth should remember that the early

"A garden plot the mountain air perfumes,  
'Mid the dark pines a little orchard blooms."

poems survive and are published with the unquestionably immortal efforts of his muse. Dear to the universal heart is the doctrine of the survival of the spirits of the dead in another condition of being, and of their sweet kinship with the dear ones left behind but destined to rejoin them in a better life:

" 'But they are dead: those two are dead,  
Their spirits are in heaven!  
'Twas throwing words away: for still  
The little maid would have her will,  
And said: 'Nay, we are seven.'"

Moreover, the choice spirits of all ages have been touched with the same sympathy expressed with simple beauty in "The Pet Lamb." Burns saw in the field mouse "a poor earthborn companion and fellow mortal." These remarks could be extended further. The claim is not made that Wordsworth never flags or fails, but all that he said has a feeling and a purpose, is grounded on a conviction or a sublime perception which the least dignified expression cannot injure or impair. Moreover, peculiarities which those who do not know and love the poet cannot tolerate, are an interest and a charm to those who companionate with him day by day.

Wordsworth freely confides with his readers. He lays bare his innermost thoughts, his deepest feelings. His poems are in this sense egotistical; but their author was not destitute of dramatic ability, as some critics say. The skeptic in the "Excursion," for example, leaves on the writer's mind an impression that

his personality is entirely distinct from that of Wordsworth at any period of his life. There is not, to his knowledge, any proof against the presumption that the skeptic is as real a creation as Shakspeare's Hamlet.

A word should be said in commendation of Wordsworth's style. He is eminently scholarly and precise in his employment of language. For this reason, if for no better one—but a better would soon follow—our young people should be encouraged to study his works among those of other masters of the language. In these busy times a correct use of English is most desirable. Comparatively few persons attain this capability, and the statement of one aid thereto may be of service.

This brief review, necessarily incomplete, will, perhaps, answer a useful service as introducing a superb volume which the publisher has produced in time for the holiday trade of the present year. It contains poems of William Wordsworth, edited with an introduction by Richard Henry Stoddard. This feature of the edition gives it a special interest to the numerous admirers of Mr. Stoddard, himself no inconsiderable poet, and whose remarks will be found of great value as a piece of criticism. They are discriminating, just and learned, and give an American character to the book which is pleasing and satisfactory to those who desire the development of national scholarship and literary taste, and give them encouragement.

The paper and letter press are of the best, and the binding most tastefully ornamental in quality. The work contains more than three hundred pages octavo, generously illustrated in a manner best shown by the accompanying pictures. Let it be remembered, however, that in the book itself the paper is of superior thickness

"We are seven."

and finish, and the printing done with greater care than is necessary or convenient in an announcement.

The publisher feels that in presenting this superb book to the

attention of the public—a book, by the way, always opportune as a gift, a valuable accession to the library and the home, and the pure instructor and solace of many hours to every appreciative possessor—he is making an experiment for which he can confidently

"This sea that bares her bosom to the moon."

predict success. The poet, the editor and the publisher has each done his part; and now, gentle reader, it only remains for you to do yours.

**CHRISTMAS EVERGREENS:** A selection of the best English and American poetry. Elegantly illustrated and bound. Cloth. Gilt edges. \$1.50.

This is an exceedingly neat and pretty volume for a holiday gift at a low price. It includes poetry by Longfellow, Bryant, Montgomery, Wordsworth, Tennyson, Sir Henry Wotton, Benjamin F. Taylor, George T. Lanigan, Goldsmith, Gray, Eliza Cook, and other prominent poets, compiled with a view to variety, and including, without prominence being given to them, subjects created under aspects of life peculiar to modern civilization.

Some of the greatest names in poetical literature give a standard and classical character to the work, not at all impaired by the attention which has been given, in quoting from their productions, to subjects having a live interest in this unique period of history. But the affections and the emotions are the same now as ever in the past, and in the great future to come. They are excited by means which may differ from those in times that are gone, and in compiling verse for popular reading this is wisely borne in mind. Still, in the collection herewith announced, are given many beautiful verses which awaken thoughts of other times and different modes of life, and quicken the sensibilities to a wide range of sympathy.

"Christmas Evergreens" is a beautiful volume. Its illustrations are numerous and after some of the best pictures produced by modern art in this and other countries. Poetry and pictorial art are happily associated in the work under description. Moreover, the printer and the binder have vied with each other in perfecting a model holiday book within the reach of all.

The publisher can find space for the mention of but a few opinions of the press as to the eligibility of "Christmas Evergreens" for a gift book, the parlor and the drawing-room table.

The New York *Evening Post* says it is "a very pretty compila-

tion;" the Boston *Transcript*, "the book is well illustrated and handsomely printed;" the New York *Tribune*, after a flattering description adds, it "furnishes an acceptable gift at a moderate price." The Washington *Republican*, Providence *Press*, *Publishers' Weekly*, and other prominent journals give a similar account of the work.

**TELEGRAPHIC TALES AND TELEGRAPHIC HISTORY.** A Popular Account of the Electric Telegraph; Its Uses, Extent and Outgrowths. By W. J. Johnston. 254 pages. Cloth. Tinted Paper. Price \$1.

The success of this book has been a marvel, the first large edition having been sold out in a few months. It was written for the public, who find in it very instructive matters presented without technicalities, and affording recreative reading which leaves valuable results. It is fascinating as a story, yet every possessor has in it a full and complete history of the development of the most wonderful achievement of modern progress—namely, the subjugation of the lightning and its service to the needs of man. A chapter on pre-electric telegraphs is followed by an account of the invention and of its introduction into this country. Then follow a talk about operators and messengers and a chapter on the use of the telegraph in war, in which due prominence is given to the American civil war. Cable telegraphs and the Atlantic cable—a valuable contribution to the history of invention—is succeeded by humorous stories and "bulls." Next the freaks of the lightning find places, succeeded pleasantly by an account of abuses wrought by the employment of lightning as a messenger. Weather reports, railway telegraphy, and new and curious applications of the electric fluid, with a whole chapter on Electricity and Life, and another copious one on Outgrowths of the Telegraph, complete an outline survey of the work, which includes within a moderate compass all that the general reader requires to know about the subject treated.

"Telegraphic Tales and Telegraphic History" is very prettily got up. The binding is suitably ornamented from designs by an artist eminent in the line of book embellishment. It sells rapidly wherever introduced. Both the trade and the public are delighted with it.

The press, American and foreign, have unanimously approved the method and matter of the work. The New York *Times* says: "This quite interesting volume gives the whole history of the telegraph in a brief and intelligent manner. The topic chosen by the author is a most interesting one, and by his thorough famili-

Sample illustration from *Christmas Evergreens*—Longfellow's "Paul Revere's Ride."

LISTEN, my children, and you shall hear  
Of the midnight ride of Paul Revere.

arity with the subject, theoretically and practically, he has succeeded in making not only a useful but a most amusing volume."

After an elaborate review, the London *Design and Work* closes with the regret expressed in the following terse sentence: "We regret that we cannot find space for more than a few extracts from this exceedingly interesting book."

"Very pretty, readable and useful," is the sententious summary of the *New York Express*.

The *New York Sun*, in a long critique, says: "The author has chosen an effective and attractive form of exposition, being careful to illustrate the salient features, characteristic incidents and important improvements of telegraphy by pertinent anecdotes. The result is that the book is decidedly entertaining, while, at the same time, it presents in a systematic and compact form a summary of such technical information as is useful to the general reader, and not unserviceable to the professional operator. It is seldom that a book containing so much substantial and not easily accessible material of a specific kind is commended to a wide audience by a careful and pleasing literary treatment."

Other prominent newspapers have given considerable space to quotations from this volume, which the publisher confidently recommends as a very salable holiday book, and one in steady demand throughout the year. Young people are invariably pleased with it.

**WIRED LOVE:** A Romance of Dots and Dashes. By Ella Cheever Thayer. 256 pp. Cloth. 75c.

The writer of this clever bright story had a happy inspiration when she hit upon its subject. Her work gives a pleasing and faithful insight into the every-day life of telegraph operators, male and female. In the development of the plot, their recreations, loves and jealousies, the humor which lightens their toils, their business aspirations, diverse peculiarities, and their domestic life, are delightfully described and all consistently within the artistic necessities of the successful novel. People who take up this work are apt to read it from beginning to end without loss of time. "Wired Love" is, in brief, an eminently successful story, in which American operators are deeply interested because of its special reference to their occupation; but less so than the general public, who find in it the first and the only novel having as its principal characters the useful and intelligent class of persons who both make the lightning talk and interpret to those who need its disclosures what it has to say for them. The publisher has given great attention to the mechanical presentation of this book, which is unquestionably both cheap, attractive and of lasting interest.

"Wired Love," remarks the *Chicago Inter-Ocean*, "is a good book to make you forget business and cares, and leaves pleasant memories behind it." The *Boston Transcript* advises every one who wishes to read a bright, original book, and desires a good laugh, to buy "Wired Love." The *New York Mail* commends it for its "cleverness and humor." The *Boston Herald* adds that the "book is written in an easy, off-hand style, is pervaded with great humor, and its sentimental portions contain some suggestions of wisdom that are expressed with great force, beauty and originality."

**GENERAL U. S. GRANT:** His Early Life and Military Career, with a brief account of his Presidential Administration and Tour Around the World. By J. K. Larke, of the *New York Commercial Advertiser*. 512 pages. Cloth. Price \$1.00.

Biographies are always the most profitable reading, since they not only yield us the pleasure experienced in perusing a good novel, but also teach us the practical lessons in life, and inspire in us the commendable spirit of emulation. A great many men fritter away their lives in a manner useless to themselves and to the community, simply because they have neglected the stimulating influence of the example of successful men who have gone before them. It has been a favorite theory with the writer for many years that when a young man makes up his mind to try to be successful in the world, he should fix upon some great historical character, make him his patron saint, and ever strive to imitate him in all that is good. All through the long range of biographical literature are found great characters which have struggled up from the carpenter's bench, the weaver's loom, and even from the laborer's hod, until the "fierce light" illumines their wonderful characters to posterity.

The interesting historical work announced at the head of these remarks leads us in the most entertaining manner through the great surging current of a human life—the life of Grant—sweeping on from comparative poverty to fame and fortune, the stream swelling with mighty deeds as it flows resistlessly onward—on through every one of the fifty-nine years which weigh so lightly on the General now. We are with him in the humble home of his childhood—the fair-haired boy, unknown and unnoticed—and again we see him, after the lapse of a few years, standing on the shell-ploughed field, the Chieftain-in-chief of a triumphant and overwhelming host, a million strong. We see him in civil life toiling at his daily labor for a struggling family, and again we hear the clanking of sabres trailing from the sides of strong men, proud in their might, surrounded by flaunting flags, and charmed by martial music—and here, again, we find him the noblest and grandest of them all. We accompany him on his triumphant, circum-mundane tour, and hear the tanner's boy imparting sound advice on matters of state to Tycoon and Wong-hi, with Sultans, Grand Lamas, Kings and Emperors hanging upon his words—a living monument and certificate to the world of the freedom of America, which sets no limit to the poor man's aspirations.

Whatever may be thought of General Grant's political action, his private life and his steady rise to highest eminence are distinctively American achievements, of which all should be proud.

There are more conflicts yet to come, more victories to gain, more youths to win glory. The battle of life is never won without ambition, and the best way to stimulate a healthy ambition is to read well-written and comprehensive biographies of eminent men. A book of 512 pages, retailing for one dollar, leaves no excuse for not studying one such work.

## TO BOOK BUYERS.

Above are announced certain books, all of which contain good and interesting reading, excellent alike both for the private library and the family. The biography of an eminent soldier and statesman; a charming work of fiction; a delightful book of instruction about telegraphic matters; poetry selected from many authors, and a handsome volume of the best productions of Wordsworth, describe a list of publications possessing very remarkable interest throughout the year, but especially in this holiday season, when parents and brothers and sisters and husbands and wives and relatives and friends are thinking what to buy as suitable for a present. The list herewith given contains a selection of books, every one of which is the right thing for a gift book, and affording variety and sufficient difference in subjects to those who are on the lookout for these advantages readily presented. All ages, all purses, all tastes are provided for, and there is excellent value for money in the case of every book offered.

These works are announced as holiday books, not only because of the propriety of their subjects, but of their mechanical presentableness. They are well made and tastefully got up books, with strong and enduring qualities withal. The Wordsworth is one of the most beautiful books that has been put on the market for a long time; handsomely bound and sumptuously illustrated, and edited by Richard Henry Stoddard. "Christmas Evergreens" has been strongly praised by the press. "Telegraphic Tales and Telegraphic History" is selling capitally, and is universally commended. The "Life of Grant" is an interesting and impartial account of the great soldier and statesman from his earliest life to after the time of the highest development of the honor given him and the nation. A sweet, unique and artistic story, "Wired Love," completes a list happily containing song and instruction, fiction and fact, and offering beautiful and substantially made books to the public, eligible for and during the holiday season, at a very low price. Any of the books will be forwarded, postage paid, to any address on receipt of the price.

is published semi-monthly—on the 1st and 15th of each month. It is devoted to telegraphic news, commercial, railroad and telephonic branches, social as well as scientific; it is a record of the wonderful growth and progress of the telegraph and telephone, and a faithful chronicler of all the changes and improvements in electrical science.

#### WHAT SUBSCRIBERS GET.

THE OPERATOR in the course of a year furnishes its readers with 24 numbers, each containing an average of 20 pages of interesting reading matter, being 480 pages, or 1,440 columns during the year. This is equal in one year to at least 2,500 PAGES OF AN ORDINARY BOOK. In addition to being kept fully informed on every matter of interest to them occurring at home or abroad, subscribers, by saving their copies, can readily turn to dates and events with which it might be desirable at any time to refresh their memories. More or less complete files bound or unbound, are always salable, and generally bring many times their original cost.

#### IMPROVED, INCREASED IN SIZE, BUT REDUCED IN PRICE.

THE OPERATOR has been enlarged and improved until it is now eight times as large as (and certainly of at least eight times more value and general interest than) it was when first started. Yet the price to-day is actually LESS than it was then. In fact, the paper is now furnished to subscribers at a price that DOES NOT COVER THE BARE COST OF PRODUCTION, our object being to secure a large circulation, and trust to advertising for our profits.

#### THE GROWTH OF "THE OPERATOR."

Any one who will take the trouble to compare the little four-page OPERATOR of seven years ago with the twenty-four page, cosmopolitan journal of to-day, will see the vast improvement. The paper was then managed by two working operators in the intervals between more serious undertakings. It now occupies the undivided attention of several business men and a large editorial corps, and circulates in every quarter of the globe, wherever the telegraph is worked. We are still anxious to make THE OPERATOR as efficient as the unstinted expenditure of money and the exercise of diligence and discrimination, with the aid of every modern appliance, can make it; and we hope that those who have found instruction or pleasure in its columns in the past will repay us for our efforts by giving us their co-operation in our endeavor to place a copy in every telegraph office and telephone exchange in the United States and Canada. The greater its circulation the stronger will be its influence, and a journal devoted to the interests of the toiling operator can never be too strong.

#### A STALWART, UNCOMPROMISING JOURNAL.

THE OPERATOR is a stalwart, uncompromising telegraphic journal. Its cardinal principles are honesty of purpose, integrity in business affairs, courage, independence, genius and industry, and its chief aims are to elevate the profession, to popularize electrical science, and to cement the fraternity in one compact body, thus rendering it proof against assault from all quarters. THE OPERATOR has already become known as the sturdy friend of the widow and orphan, the unfortunate and oppressed, wherever found.

#### AN AVERAGE OF 67 4-5 COLUMNS OF MATTER PER ISSUE.

Acting upon these principles, and in order to accord the widest range to every subject, THE OPERATOR, from the first of January until the 15th of November, 1881—ten months—published 452 PAGES OF SOLID, SUBSTANTIAL READING MATTER,

being an average of 22 3-5 pages, or 67 4-5 columns for each issue. Every issue has been teeming with news, scientific essays and the social gossip of the profession, including the airiest fancies and the gravest facts, but all worthy of the culture and great intellectual power now so marked in our profession.

#### CAREFULLY AND CONSCIENTIOUSLY EDITED.

THE OPERATOR is carefully edited in every department by a large and well-chosen editorial staff, which includes some of the finest telegraphic statisticians, astute thinkers and philosophers in this most remarkable business. We regard it as our peculiar province to find out at any cost what is going on telegraphically; to make it public in a truthful and lucid manner; to expose shams and frauds of all kinds, high or low; to give praise where praise is due, irrespective of prejudice, and to do some courageous and vigorous thinking thereon. As every item is, as far as possible, tested and proved before being printed, we find our editorials largely quoted, both at home and abroad, as authority upon all telegraphic subjects. Under the title of "editorial" we might also, perhaps, class a subject which is now attracting wide attention for its conciseness, truthfulness and sweeping scope, viz.: The

#### "REVIEW OF THE PAST TWO WEEKS,"

covering all telegraphic events of importance, and the doings and sayings of those who are written and read about.

#### A FAITHFUL RECORD OF CURRENT EVENTS.

THE OPERATOR also aims to be a complete record of the births, marriages, deaths, appointments, promotions, transfers, resignations and all the social gossip of the profession, refraining, however, from all that might be injurious or offensive to innocent or well-meaning persons. It maintains

#### INTELLIGENT AND LIVELY SPECIAL CORRESPONDENTS

at all important telegraph and telephone centres; on the frontier, in Europe and the Pacific Archipelago; and it uses the telegraph freely for news of events transpiring a short time before going to press.

#### CONDENSED PRACTICAL SCIENTIFIC INFORMATION.

While not aiming to be severely scientific, THE OPERATOR'S "Scientific Column" contains a carefully prepared epitome of all current thought and experiment in electrical matters, as communicated to us by our leading scientists, or culled from the scientific journals of America and Europe. Foremost in this department are the excellent

#### "NOTES AND QUERIES" OF MR. T. D. LOCKWOOD,

which have won a well-deserved place in the record of electrical science. These articles, plainly written, form one of the most efficient helpers for a young man desirous of studying the science.

#### LONG SEMI-MONTHLY LETTERS FOR 4 CENTS EACH!

Just think of this: If you had a friend who proposed to send you twice a month a long letter, containing all the news and other information mentioned above, and such other matters connected with your business as it was to your interest to know, and if he agreed to do this for ONE DOLLAR A YEAR—less than sufficient to pay for writing paper and postage—and you knew that he was perfectly responsible and would do as he promised, don't you think it would be rather short-sighted on your part not to accept his proposition? Yet that is precisely what THE OPERATOR offers to do, and is doing, although it spends THOUSANDS OF DOLLARS A YEAR in carrying out the contracts.

#### WHY EVERY OPERATOR SHOULD READ "THE OPERATOR."

It is controlled by no company or faction, and aims solely to serve the best interests of the telephone and telegraph employees. The average newspaper, propitiated with liberal orders or advertising, never dares to give the true state of affairs with regard to the working operator; indeed, it may truthfully be said that the American telegrapher never had a journal to say one word in his behalf and never had any influence or weight in telegraphic affairs until he commenced to do his own printing. All the traditions, all the history and even the very existence of THE OPERATOR depend upon the great rule of allowing

#### THE LOWEST OPERATOR AN EQUAL CHANCE WITH THE HIGHEST OFFICIAL

to "speak his piece," and to spread his suggestions and grievances before his superior officers or fellow-workers. In fact, all the thoughts, all the aspirations, and all the hopes of the profession were utterly lost until THE OPERATOR caught them up, bound them into sheaves and preserved them by "the art preservative of all arts" for all time.

As an organ of opinion, THE OPERATOR is

#### FIRST, LAST AND ALL THE TIME FOR OPERATORS AND THEIR BEST INTERESTS.

Telegraphic and kindred topics are recorded and discussed as they arise, while its record in defending the widows and orphans of unfortunate telegraphers requires no comment. While it is a well-known, staunch supporter of the members of our craft, it is, at the same time, never to be blinded to their faults, if any are found to exist; and, believing it is better to touch and heal, to cast out and chastise those who are unworthy of confidence, it points them out,

#### NO MATTER WHAT POSITION THEY MAY OCCUPY.

While aiming to expose, and so to correct, all that is deceptive, unjust or corrupt in official life, we do not regard it as productive of good results to the profession at large to give these unpleasant matters undue prominence before an effective effort is made privately to correct them.

But, to the toiling operator, clerk and lineman THE OPERATOR should need no word of indorsement; for, as the accredited organ of the profession, it has advanced so far in prosperity as to be

#### ABSOLUTELY INDEPENDENT OF ALL OFFICIAL INFLUENCE,

as well as cliques and factions of all kinds. THE OPERATOR has never yet hesitated to face any emergency, no matter from what quarter it came. The position we take on any question is the one which seems to us to be for the best interests of the profession and of the fraternity and any threat or pressure tending to make us swerve from

#### THE TRUE PATH OF CONSCIENTIOUS DUTY AND PROFESSIONAL ETIQUETTE

can have no possible effect in changing our course.

There are also other reasons why THE OPERATOR justifies the generous support which it now receives. The wonderful fecundity of our inventors, whose discoveries are following rapidly one after the other, and the great number of gigantic enterprises already projected, present

#### A WIDE AND PROMISING FIELD FOR THE AMBITIOUS

and promising young man. Now, it stands to reason that the operator who does not read his class paper must soon become a kind of telegraphic Robinson Crusoe. He must necessarily remain

#### IGNORANT OF THE PROGRESS OF TELEGRAPHIC EVENTS,

and it is certain that no one who is badly informed on this subject can ever hope to raise himself above the level of the ordinary ruts of daily life. Therefore, no operator who expects to

#### PROFIT BY THESE ENTERPRISES,

or even to secure for himself a better-paying situation in the thousand and one changes which these new plans, schemes and ever-changing combinations produce,

#### CAN AFFORD TO MISS "THE OPERATOR" FOR A SINGLE ISSUE,

since he cannot in any other way be made acquainted with his general prospects; and the odd number which he misses may be the very one which would otherwise have given him the hint that led on to fame and fortune.

#### THE NATIONAL PORTRAIT GALLERY AND OTHER ILLUSTRATIONS.

During the year 1881 THE OPERATOR published pictures of Gen. Eckert, Messrs. Bates and Doren—the trio that made the American Union famous—Theodore N. Vail, General Manager of the American Bell Telephone Co., all full-page illustrations; Operators Albert S. ("Patsey") Ayres, of Cincinnati; William D. West, of New Orleans; P. J. McMahon ("Paddy Mack"), of Boston; John C. Sherer, of California, and John Lenhart, the Citizen of the World. Besides these, the present volume has produced some splendid illustrations, with full description, of the Chicago Police and Patrol system, and other matters of current news.

#### REVIEWS AND ESSAYS

of great interest and intrinsic value appear in each issue, while the occasional humorous articles of "Werner" are too well known to need commendation.

THE REVIEW OF THE YEAR, published in our issue for January 1, is alone worth a year's subscription to the studious telegrapher.

#### CONTENTS OF ONE VOLUME.

The back numbers for the year 1881 also contain an exhaustive review of the Consolidation of the Western Union and American Union Companies, and the ensuing lawsuits; the effort of the Postal Telegraph advocates; full and dazzling accounts of the Paris Electrical Exhibition and the Congress of Electricians at the same place (THE OPERATOR having had a special correspondent in the Palais de l'Industrie during the whole of the Exhibition); gradual progress of the telegraph and telephone; valuable statistics and important and most interesting comparative statements; financial reports; railroad telegraphs; salaries paid; fast sending—time made and number of words sent in a given time; new companies formed; biographies and obituaries of noted men and women; the electric light; new inventions; telegraphic and telephonic conventions, telegraphic journalism; the telephone, in all its phases; ocean cables; remarkable anniversaries, and the progress of the telegraph in England, the continent of Europe, India, Australia, South America and all other places abroad.

#### PROMPT SERVICE AT AN INSIGNIFICANT COST.

All this reaches you regularly, just as a faithful correspondent would write you a long letter by mail twice a month, and costs you only four cents a letter! In providing for this slight expense, there are many small outlays which could be abolished to counterbalance the cost. You might dispense with the daily papers, and you might even get along without your local paper, but you ought not to think of being without the journal of your own profession—the operators' organ—the only paper in the world published in the interests of the fraternity of which you are a member. The price,

#### ONE DOLLAR FOR A WHOLE YEAR,

is nothing compared with the benefit you will receive from a perusal of THE OPERATOR during the next twelve months. Try it and you will be convinced.

#### WHY ALL WIDE-AWAKE OFFICIALS SHOULD READ "THE OPERATOR."

No official organ of any particular company can ever be of use in guiding the wide-awake official. It is admitted that nothing in the newspaper world could have less influence than an "official organ," since its recognized position and common fame put it in the light of piping always to the same creaking key; and its reports being always colored are consequently

utterly valueless as matters of record. THE OPERATOR, on the other hand, looking merely at its independent position, must be an admirable corrective instrument, for the better class on both sides study its reports, and all admit that it is the fairest field for friendly controversy, exhortation, explanation and good-natured criticism regarding all that pertains to the interest of telegraphers. It is, as has been well said of the press in general, like an eruption of Vesuvius—a sort of safety-valve by which ideas and feelings which, if they remained imprisoned, would result in earthquake, are released, ejecting with them a good deal of mere steam, a great quantity of ashes, and a certain amount of lava, that, by its crumbling ultimately covers the soil with smiling vineyards and benefits to mankind.

These facts are gradually becoming understood among officials, and the journal which, in a manly, straightforward way, tells them when they are wrong commands their respect. THE OPERATOR is the

ONLY COMPLETE INDEX OF AMERICAN TELEGRAPHIC LIFE, a continued story of our thoughts and actions as a body, without a knowledge of which any one is unfit for successful telegraph leadership.

#### WHY ALL TELEPHONE MEN SHOULD READ "THE OPERATOR."

The progress of the telephone has been such, and so many of our very best men have gone over to that branch of our profession, that it demands especial attention at our hands. We have, therefore, commenced a new department of this paper, devoted exclusively to the telephone, its rise and progress, and every-day gossip in connection therewith. We receive regularly items of this kind from the various telephone exchanges throughout the country. Indeed, the Telephone Department of THE OPERATOR jumped at once into popular favor, and is now eagerly read by the members of that important and fast-growing branch of telegraphy. In the present volume are to be found complete accounts of the famous litigation between the English government and the telephone people; the telephone conventions, with much interesting data, and a record of long-distance telephoning. The lucid and elaborate papers of Mr. T. D. Lockwood, discussing practical telephonic subjects in popular language, are so well known and so deservedly popular among telephone men as to need no comment here.

#### WHY EVERYBODY SHOULD READ "THE OPERATOR."

A profession like ours, growing daily, hourly, and with its various branches in the telephone companies, the railroads and Signal Service, the working members of all of which are unsurpassed in activity, ingenuity and the importance and effectiveness of their work, should support a FIRST-CLASS, THOROUGH-GOING, INDEPENDENT PAPER, to be spread broadcast over the civilized world.

SCIENTIFIC MEN AND STUDENTS SHOULD READ "THE OPERATOR," because it is a complete, connected and well edited record of electrical progress. Avoiding the redundant fulness and dry details of scientific research, it is careful to preserve the important facts in all that it is necessary for the scientific student to know. Ever since the introduction of the telegraph, men have been writing voluminously upon electrical subjects, but their efforts have been rather too deep for the ordinary student. Our articles are, therefore, written with a special desire to avoid that great stumbling block to the acquisition of electrical knowledge; to disentangle the multiplicity of knotty questions and to

PRESENT THEM STRAIGHT AND SMOOTH TO OUR READERS,

thus affording the junior members of our profession an opportunity of mastering, in an easy way, the most intricate questions.

#### A WORD FOR OUR ADVERTISERS.

The support so generously given to THE OPERATOR has enabled us to print, each issue, many extra copies for circulation abroad, in addition to our regular edition, until the paper is now mailed regularly to all parts of every State and Territory on this continent, and to every country abroad, wherever the English language is read. The reduction of our subscription price to ONE DOLLAR A YEAR, together with the attractive make-up of the paper, and the earless, enterprising and reliable attitude which it assumes, have made it a great favorite, and promise to induce

EVERY TELEGRAPH AND TELEPHONE MAN IN THE UNITED STATES AND CANADA, to become a subscriber; in fact, the paper is more than keeping pace with the existing development of the telegraph.

THE OPERATOR has now the largest circulation among regular paying subscribers of any telegraphic paper in the world. It is, therefore,

#### A VALUABLE FIELD FOR ADVERTISERS,

and, in connection with the reasonable rates which we afford them—for, notwithstanding that OUR CIRCULATION HAS MORE THAN DOUBLED DURING THE PAST YEAR, our advertising rates have not been increased—it forms the very best means of spreading their wares before the world.

#### READ WHAT IS SAID OF THE OPERATOR.

"A bright, sparkling telegraphic paper, and employs all the brightest lights in the fraternity, at a fair remuneration, as contributors."—*New York Correspondent*.

"THE OPERATOR is a thorough-going, enterprising and scholarly paper, and well represents the culture and rapid progress of the telegraph."—*Philadelphia North American*.

"We congratulate Mr. Johnston on his well-merited success in this peculiar field of literature. THE OPERATOR circulates among about 25,000 telegraphers in this country."—*Philadelphia Sunday Mercury*.

"There is no telegrapher who takes an interest in his business but who should become a subscriber to a journal which is the sole mouthpiece of the telegraphic profession—its only representative in the 'press' of the country."—*Philadelphia Correspondent*.

"Many of its issues have been models of taste in the arrangement of its selected articles, and the scope and spirit of its editorials and correspondence. It is spirited, cheerful, vivacious. It has a large subscription list, and the odor of the operating-room pervades its pages. Such a paper is only possible in an intelligent staff of men such as work the wires of the American lines."—*Telegraph in America*.

"THE OPERATOR is an independent, wide-awake and highly successful telegraphic and scientific newspaper, written, managed and sustained purely by practical operators, and should find a warm place in the heart of the 20,000 telegraphers in America. Pictures drawn or engraved by telegraphers, and portraits of the most prominent operators are published periodically, while the great fund of bright wit and curious experience so closely allied to the life of every telegrapher, forms its main topics."—*Philadelphia Inquirer*.

"The telegraph operator who takes no professional journal has too little pride in his personal improvements to be of much service to the company he works for. There are operators who take no professional paper whatever, who yet spend in a year many times the price of one in cigars, tobacco and beer. Who are they who fill the highest, most responsible positions in the telegraph business? Are they those who are content with the bare ability to send and receive? How many of them, do you suppose, are without a professional journal?"—*Cincinnati Correspondent*.

#### TERMS OF SUBSCRIPTION

INVARIABLY IN ADVANCE

One Copy, One Year, Postage included, - - \$1.

The Postage to any part of the United States or the Dominion of Canada, is always prepaid by the publisher, and addresses changed as often as desired, without extra expense.

To foreign countries in the Universal Postal Union—which includes Newfoundland, England, France, Germany, Australia, etc.—the price, postage prepaid, is only \$1.25 per annum. To countries not in the U. P. U., the subscription is \$1.50.

We much prefer yearly subscriptions, and they are more satisfactory to subscribers themselves but to those who desire to subscribe for a shorter period we will mail the paper, postage prepaid, for nine months, for 75 cents; six months for 50 cents, or three months for 30 cents.

Should any difficulty arise in procuring copies, direct communication with the publisher is

requested. Specimen copies, singly or for getting up clubs, mailed free on application to the publisher. In case subscribers should at any time fail to receive their copies of the paper regularly and promptly, they have only to notify us, when the matter will be immediately investigated and remedied.

Should you change your residence at any time—no matter how often—you have only to notify us and the paper will be sent to your new address. We prepay all postage, too, so that you have no further expense of any kind, except the subscription price, and you are under no obligation to take the paper for a longer period than that for which you pay. If the subscription be not renewed when it shall expire, the paper (as is our invariable custom, will promptly be stopped.

Subscriptions can commence at any time.

**We will send THE OPERATOR from December 1, 1881, until January 1, 1883, postage prepaid, for ONE DOLLAR.**

Send in your name at once and take advantage of the above SPECIAL OFFER.

#### INSTRUCTIONS ABOUT REMITTING.

A one dollar bill, in an ordinary unregistered letter, addressed to W. J. JOHNSTON, PUBLISHER, No. 9 MURRAY STREET, NEW YORK CITY, will almost unquestionably reach us. Larger amounts should be sent by post-office order, draft, registered letter or express, in which case they are at our risk. For fractions of a dollar, or where it is inconvenient to send cash, U. S. 1, 2 or 3 cent postage stamps will be accepted. If Canadian postage stamps are remitted, 12 per cent. additional should be sent to cover discount on them here. Canadian currency will be accepted at par. Don't send mutilated or worn-out currency. Silver, except in small amounts, should not be sent in an unregistered letter. It is always more satisfactory to send remittances to the publisher direct, in which case you will know that the money will be received and the order promptly attended to.

Many would doubtless like to send for THE OPERATOR who are deterred by the supposed great trouble and risk of sending money by mail. The fact is, however, that there is very

#### LITTLE TROUBLE AND ALMOST ABSOLUTELY NO RISK

in ordering in this way. We get thousands of letters every year ordering the paper and some of our books, and it is very rarely indeed, either that a letter sent to us goes astray (and then only when the sender has addressed it incorrectly), or that a package mailed by us fails to reach its destination. If you have never hitherto ordered anything from New York, send us an order now for THE OPERATOR and some of our books, and you will see that they will reach you by return mail. All orders, unless in cases where there is a necessary delay, such as in the printing of names on cards, are attended to and sent by mail or express the same day they are received. Be sure to give your full name and address, and you will have no trouble about receiving the goods promptly. Should they, however, for any reason, not reach you in a reasonable time, drop us a postal card and we will ascertain the cause of delay and rectify it. REMEMBER, WE PREPAY POSTAGE ON ALL OUR PUBLICATIONS—BOTH THE OPERATOR AND THE BOOKS.

Remit by post-office order, draft, registered letter or express, U. S. postage stamps taken. Address communications and make orders payable to

W. J. JOHNSTON, Publisher,

NO. 9 MURRAY STREET, NEW YORK.

#### TO FRIENDS OF THE OPERATOR.

The publisher presents his compliments to you and congratulates you upon the improvement in THE OPERATOR which he has been enabled to make during the year as the result of your co-operation with him. He has a proposal to make, and one which bears a direct relation to your interest as to his own, and proceeds to state it without further introduction.

You are invited to assist the publisher to make THE OPERATOR even better than it is now. There was a time when the subscription list was much smaller than at this writing. Like many other large things THE OPERATOR had a small beginning, but it has steadily grown and improved as more and more subscribers have been added to the list. In the future, as in the past, the publisher will faithfully respond to his increasing subscription list. You can help to further enlarge the size and improve the value of THE OPERATOR by your co-operation with him. Inducements to the formation of clubs are stated in another place. Give yourself a little enjoyable labor in order to make THE OPERATOR the best telegraphic paper in the world.

A good plan would be to send operators of your acquaintance a copy of the paper and afterwards confer with them about it over the wire. There would be no difficulty in this way of emphasizing to them how interesting, varied and instructive are its contents. Nor could there fail to be a large proportion of responses, because the more THE OPERATOR is examined and spoken about the better it is liked. Subscribers continue right along after once beginning, and so would your friends.

The success of others in the past, who assisted when such liberal offers as are now made were not practicable, is a guarantee that your time would not be wasted did you give yourselves the pleasure of setting about inducing your friends to bear you company in promoting the value of THE OPERATOR by the extension of its circulation. Copies of the paper and circulars of a helpful sort will be sent free to those who need them in order to carry out what is herein proposed,

## THE OPERATOR

Was never so good as it is To-day, nor its Subscription List so Large.

In view of the recent enlargement and improvement in the paper, and the addition of the "National Portrait Gallery" and other new and desirable features, it is hardly necessary to assure the fraternity that in the future as in the past, our conscientious and earnest effort shall always be to FURTHER IMPROVE THE PAPER until it shall be just AS VALUABLE TO SUBSCRIBERS as MONEY, PAINS AND DILIGENCE CAN MAKE IT.

Those acquainted with the progress of THE OPERATOR are aware that—notwithstanding the extremely low subscription price—the paper has WONDERFULLY IMPROVED, especially within the past year. We believe, however, that DURING THE ENSUING YEAR it will be found very MUCH BETTER, MORE INTERESTING and MORE INSTRUCTIVE than at any previous time since it was established—so much so, indeed as to be ABSOLUTELY INDISPENSABLE to those who desire to be kept informed on all telegraphic subjects, and wish to qualify themselves for promotion.

We offer VERY LOW COMBINATION RATES where one or more of our books are ordered in connection with the paper. When the order amounts to \$4.00 OR OVER, we allow A DISCOUNT OF NO LESS THAN 25 PER CENT. from the regular retail price. Intending subscribers should avail themselves of this combination offer, and thus secure such of our books as they shall require at LOWEST WHOLESALE PRICES.

The success of THE OPERATOR depends in a very great measure upon the telegraphers themselves. It is our earnest desire that the paper shall be as able, useful and influential a journal as it can be made, and to have it circulate, if possible, in EVERY TELEGRAPH OFFICE IN THE UNITED STATES AND CANADA. If you lend us your co-operation to this end, we shall consider it a great favor.

You can render us a service which we shall not be slow to appreciate, if you will assist us in increasing our subscription list, BY GETTING THE NAMES OF A FEW SUBSCRIBERS TO SEND US. The larger our list of subscribers, THE BETTER THE PAPER CAN BE MADE and the MORE INFLUENCE IT WILL HAVE. EVERY telegrapher should, therefore, take a PERSONAL INTEREST in extending its circulation.

### TO TELEGRAPHERS.

The publisher wishes to direct your particular attention to his holiday announcements, because they afford an opportunity for both you and him to aid the happiness of the coming festival season with the rewards of pleasant labor. This is the season in which people improve the joys of home and of friendship by making presents to each other. Now there is no more desirable pledge of affection or goodwill than the gift of a book containing, as Milton says, "The precious life-blood of a master-spirit." Such a book is pre-eminently that one respecting which you can see extended remarks in a circular accompanying this. A holiday edition of the poems of Wordsworth, edited and with an introduction by Richard Henry Stoddard, beautifully bound and illustrated, is offered to the public at three dollars. It is a remarkably cheap book at the price, because well made as well as ornamental, and a lasting treasure in its reading matter and appearance. The publisher thinks that every telegrapher and telephone man who reads these words could sell some copies of this book, and he invites co-operation from all. He offers to send three or more copies of the book for \$2.25 each, a profit of 75c. on each copy. As telegraphers have a large acquaintance with well-informed people, it would be easy for them to procure some orders for the book. For four orders at regular retail price, the publisher will send an extra copy of the work free, and postage or express charges prepaid. For twelve yearly subscriptions to THE OPERATOR he will send a copy of Wordsworth free as a premium, and for fifteen yearly subscriptions a copy of Wordsworth and "Telegraphic Tales and Telegraphic History," a book which no operator should be without.

If you show these advertisements to acquaintances they will assist you to get orders for the books described in them. It isn't necessary to point out what an opportunity you and your friends have to "chip in together" for Wordsworth and get a splendid volume for \$2.25 each.

## HOW SOME OF OUR BOOKS MAY BE SECURED FREE.

### Valuable Premiums for Clubs.

The Publisher is anxious to very much further increase the circulation, and consequently the influence and usefulness, of THE OPERATOR, and desires the hearty co-operation of the fraternity at large in the efforts he is now making to that end. There are very few telegraph or telephone men who cannot, if they will, render valuable aid in this respect. To induce as many as possible to at once "put their shoulders to the wheel," we offer the following remarkably liberal premiums for clubs:

- For 2 YEARLY SUBSCRIPTIONS, we will send FREE AND POSTAGE PREPAID
- "TELEPHONE AND OSHKOSH" or "OAKUM PICKINGS" (paper).
  - " 3 " "OAKUM PICKINGS" (cloth), "WIRED LOVE" (cloth), or "SAM JOHNSON" (paper).
  - " 4 " "TALES AND HISTORY," "THE DICTIONARY," "LIGHTNING FLASHES," "GENERAL GRANT," "CHRISTMAS EVERGREENS," or "SAM JOHNSON," (cloth).
  - " 12 " "WORDSWORTH."
  - " 12 " A STEEL LEVER KEY.
  - " 16 " A pair of HOLCOMB'S "AUTOMATIC" ACOUSTIC TELEPHONES.
  - " 18 " "MORSE," "HOME" or "GEM" LEARNERS' OUTFIT.
  - " 20 " PRESCOTT'S "ELECTRICITY AND THE ELECTRIC TELEGRAPH."
  - " 20 " A GIANT SOUNDER.
  - " 20 " Pair of "ELGIN" ACOUSTIC TELEPHONES.
  - " 20 " PREMIUM LEARNERS' OUTFIT.
  - " 20 " Any TELEGRAPH (Scientific or Popular) BOOKS, to the amount of FIVE DOLLARS.
  - " 20 " A "LATTIG," "CUMMING," "DELANY" or TOP CONNECTION KEY.
  - " 30 " "WORDSWORTH," "CHRISTMAS EVERGREENS," "TALES AND HISTORY," "WIRED LOVE," "OAKUM PICKINGS," "LIGHTNING FLASHES," "GENERAL GRANT," "THE AMERICAN POPULAR DICTIONARY" and "SAM JOHNSON" (all bound in cloth).
  - " 30 " "GIANT" SOUNDER and STEEL LEVER KEY.
  - " 35 " Pair HOLCOMB'S "AMPLIFYING" TELEPHONES.
  - " 50 " SHAKESPEARE'S COMPLETE WORKS, HUDSON'S NOTES (6 vols., cloth, gilt.)
  - " 60 " "LIBRARY OF UNIVERSAL KNOWLEDGE (15 vols., 13,000 pages, 6×9 inches), embracing Chambers' "Encyclopedia," with American additions, making the work thoroughly American, and "worth its weight in gold" to every studious telegrapher.
  - " 60 " A SILVER WATCH.

All book premiums will be forwarded postage or express charges prepaid by the publisher.

If other premiums than those mentioned above are desired, they can be had for a proportionate number of subscriptions, according to value. Where a cash commission is preferred, deduct 20 per cent. before remitting.

Renewals count same as new subscriptions. Two half-yearly or four three months' subscriptions are equivalent to one yearly subscription. You can take credit for your own subscription same as for any other.

The number of subscriptions necessary to secure any premium can be much reduced by sending us, in addition to the subscriptions, orders for some of our books. Should any agent find it impossible to obtain sufficient names or orders to entitle him to the premium he wishes, the difference can be made up in cash, when the premium will be at once forwarded him.

Should sample copies of THE OPERATOR, or of circulars, or further information of any kind, be desired, drop us a postal card and they will be promptly mailed you.

Send in names and money as fast as received, which will be placed to your credit and can be added to at any time.

Remit by post-office order, draft, registered letter, or express, and give your full name and address every time you write.

**W. J. JOHNSTON, Publisher,**

No. 9 Murray Street, NEW YORK.

## PRICE REDUCED TO ONE DOLLAR. Lightning Flashes and Electric Dashes,

A VOLUME OF

Choice Telegraphic Literature, Humor, Fun, Wit and Wisdom.

CONTRIBUTED TO BY

ALL THE PRINCIPAL WRITERS IN THE RANKS OF TELEGRAPHIC LITERATURE, AS WELL AS SEVERAL WELL-KNOWN OUTSIDERS.

COPIOUSLY ILLUSTRATED.

**176 Large Octavo Pages. Cloth. Price, \$1**

This book is a lasting example of the literary talent and native wit of American tele-

graphers, all the lights of the profession having banded together to give us a book well worth reading.

"Every person who has the fortune to see this volume will desire to possess it."—*N. Y. Hebrew Leader*."Written in a bright and sparkling style, and the numerous illustrations lend an additional interest to the work."—*N. Y. Graphic*."The interest of the reader commences with the initial chapter, and from this to the end of the volume there is nothing but a succession of pleasurable surprises."—*Harrisburg (Pa.) Independent*."Thoroughly telegraphic and highly amusing, the cartoons cleverly executed, the narratives pithily and in part brilliantly worded, while the variety supplied will make it difficult for any who may have the privilege of reading the book to do so without enjoyment."—*London (Eng.) Telegraphist*.**THE OPERATOR, 15 Months, and Lightning Flashes, only \$2.00.**

### DISCOUNT ON ORDERS FOR BOOKS.

Where any of our publications to the value of \$4.00 or over are ordered together the purchaser may deduct

**25 Per Cent.**

from the regular retail price before remitting. The books will then be forwarded, postage or express charges prepaid. All orders filled on the date of their receipt.

We will send to the same or separate addresses any two of the books marked at \$1.00 for \$1.75, and THE OPERATOR for fifteen months in connection with any one dollar book for \$2.00.

### How You may Add to Your Income.

Enterprising operators along the line of railroads and in large cities can add a comfortable sum to their income by selling our books to their co-laborers and friends, and availing themselves of the liberal discount which we give to agents.

Canvass your district, then send us an estimate of how many books you can dispose of, with their names, and we will give you such a rate on the entire consignment as will leave you a respectable margin for yourself.

Address, for particulars,

**W. J. JOHNSTON, Publisher,****No. 9 Murray Street, New York.**

## A MAGNIFICENT WORK !!

# POEMS OF WILLIAM WORDSWORTH

Edited, with an Introduction, by Richard Henry Stoddard.

**320 Large Pages, Elaborately Illustrated. Cloth, Gilt Edges, Price \$3.00.**

This is the most pretentious volume we have yet attempted. Every illustration it contains was engraved especially for it, by the foremost of American engravers. There are no fewer than 74 engravings in the book, and they are all large, nearly every one being what might be called full page.

The book is unusually prettily bound, with a profusion of gold on the side and back, and gilt edges. The design for the cover was made especially for it, by an artist whose reputation for such work is national.

For the purpose of securing the proper margin, the paper—which is thick, fine and of a rich cream tint—was also made to order; and throughout no expense was spared to add to the beauty, value and attractiveness of the book.

### This is no Reprint of an English Edition.

The cuts are all new and the plates made from new type. No such elaborate edition of Wordsworth has ever been published on this side of the Atlantic. Similar works published in England, not any handsomer than this, and, indeed, not so handsome, cost from \$9 to \$12 a copy. The price of the present volume, however, puts it within the reach of every telegrapher wishing to make a holiday present. The book is all ready and orders will be filled as soon as received.

Agents Wanted for the New Book, to whom we will allow liberal commissions.

**"The Operator" for One Year and a Copy of Wordsworth will be Mailed Together, Postage Prepaid, for \$3.50.****"Tales and History," or any of our other \$1.00 Books, at the same Price—\$3.50.****"Wordsworth" and "Christmas Evergreens" together, both prepaid, only \$3.75.****"Tales and History," "Christmas Evergreens" and "Wordsworth," \$4.25.****"WORDSWORTH," "CHRISTMAS EVERGREENS," "THE AMERICAN POPULAR DICTIONARY," "TALES AND HISTORY," "WIRED LOVE" and "OAKUM PICKINGS," all cloth, prepaid, for \$5.00. With THE OPERATOR for fifteen months added, \$6.00.****"WORDSWORTH," "CHRISTMAS EVERGREENS," "TALES AND HISTORY," "WIRED LOVE," "OAKUM PICKINGS," "LIGHTNING FLASHES," "GENERAL GRANT," "THE AMERICAN POPULAR DICTIONARY," and "SAM JOHNSON," all bound in cloth, with "TELEPHONE AND OSHKOSH," paper—making an elegant telegraphers' library—only \$7.50. THE OPERATOR one year and above ten books, \$8.00.**

A copy of "WORDSWORTH" will be mailed FREE to any one sending us orders for FOUR copies of the book at regular price; or to any one sending orders for any of our books, at regular rates, amounting to \$12.00, or for a club of 12 yearly subscriptions to THE OPERATOR.

**W. J. JOHNSTON, Publisher,**  
**No. 9 MURRAY STREET, - - - NEW YORK.**

## PERSONAL.

Mr. H. L. Haupt has been transferred from Tyrone, Pa., to Carlisle, Pa.

M. J. Adams, of Frankton, Ind., has accepted the agency at La Crosse, Ind., on the Pan Handle.

Messrs. Reed and Johnston, who have been in the Atchison, Kan. W. U. office for a short time, have left for Mexico.

Mr. Sam B. Roberts, late of the W. U., has been appointed chief operator for the B. & O. at St. Louis, taking with him Mr. Baker and others.

Messrs. J. Frank Howell and Rus. Gillette are in Grand Rapids, Mich., visiting their old friends. They are just from the West and *en route* for the Metropolis.

Mr. John Johnson and Mr. Peters, the efficient train dispatchers, Mr. J. E. Telley, owl, and John Westrick, day man, are the force for the Central R. R. at Greenleaf, Kan.

Mr. F. P. Wheeler, of the St. Louis, Mo., W. U. office, has accepted a position with the Mutual Union, same city. Mr. Wheeler is a well known and popular telegrapher.

Mr. Edward P. Howarth, night operator at Thirty-third street, on the N. Y. C. R. R., this city, has been transferred to a position as day operator at Willopee on the N. D. & C. R. R.

The six-year-old son of Mr. A. L. Cool, agent and operator of the G. R. & I. R. R. Co., Tustin, Mich., fell into a tub of boiling water, Nov. 22, and was so badly scalded that death ensued in a few hours.

If you have a young lady friend to whom you desire to make a holiday present, read the Christmas announcements in this issue. Unless you are extremely difficult to please, you will find something to suit you there.

Mr. Tracy R. Edson, for many years prominently identified with the Western Union and Gold & Stock Telegraph Companies, American Speaking and Metropolitan Telephone Companies, the Edison Electric Light Co., etc., died in this city on Tuesday, Nov. 29.

John H. Kratz, formerly operator at Paschallville (P., W. & B. R. R.), Pa., will hear something to his advantage by communicating his present address to T. P. Harvey, Western Union Telegraph Company, Doylestown, Pa. A legacy has been left him.

Mr. M. E. Johnson, for the past seven years manager of the W. U. Carbondale (Pa.) office, has accepted a position as operator at Hornellsville, on the N. Y., L. E. & W. R. R. Mr. T. H. Bower is his successor at Carbondale.

John Brady, the well-known lineman of the Central Branch Missouri Pacific R. R., has just completed a branch line for that road, from Jamestown to Yuma, Kan., a distance of 60 miles, with two sets of repeaters at Yuma.

Mr. W. E. Jermain, who has been manager of the W. U. Tel. office at Elkhart, Ind., has resigned his position on account of ill health. Miss M. O. Fenton has been appointed manager. Miss Fenton, though a young operator, is an efficient one.

Mr. Charlie Patch, of Des Moines, Iowa, a well-known telegrapher, died at his residence in that city on Tuesday, Nov. 22, and was buried on Thursday, the 24th. A beautiful floral offering from the Chicago telegraphers was received by the family.

Mr. E. M. Riddle, inspector of the St. Joseph (Mo.) Telephone Exchange, after an absence of six weeks at his old home in Pennsylvania, is expected home again with one of the old Keystone's fair daughters as his bride. His numerous friends will give him a warm reception.

Mr. George M. Myers is manager and Alexander F. Washington day chief at St. Joseph, Mo. The day force consists of Miss Baylies, Miss Eib and Mr. Harnet, and the night force of A. H. Burke, night chief, and J. D. Prosser, press operator. Two last named leave for St. Louis today, Dec. 1.

Sergt. W. T. Blythe, who has for the past three years been chief operator of the Texas Division, U. S. Military Telegraph Lines, returned from a thirty days' leave of absence, Nov. 3, and has resumed his duties at Department Headquarters. Sergt. James A. Gleason acted as chief operator during Mr. Blythe's absence.

Dispatcher Ross, of the Grand Trunk Railway, Cornwall, and George Betts, of Vandreine, Quebec, have resigned their positions and gone to Chicago. Jack Shannon, of St. Anns, has gone to the Chicago & Grand Trunk. Assistant Superintendent Stevenson, of the same road, has also resigned, and is succeeded by Mr. T. H. Cooper, of Toronto.

The remains of Thaddeus F. A. Clock, until recently telegraph operator and ticket agent for the Long Island Railroad Company at Mineola, L. I., who threw himself in front of a train at Bellingham, Mass., were brought from that place to Islip, L. I., where the friends of the unfortunate young man reside. Young Clock was not indebted to the railroad company when he went away, as was at first reported.

Mr. W. A. Weller is chief dispatcher Western Division L. S. & M. S. Railway at La Porte, Ind. Messrs. H. C. Noah, O. C. Carrell and George Sweetnam are the assistant dispatchers, with Messrs. Arnold, Shultz, Zeisel and Tom Barrett operators. Mr. Noble is manager and Samuel Egnew assistant at the W. U. office. At end of double track, west of La Porte, Mr. P. E. Barkdale works days and Mr. Chas. A. Walker nights.

A Chattanooga correspondent says: Last Monday morning, the handsome and genial Mr. Skelton, who manipulates the Atlanta wire in this office, was missing from his post. As it is the first time within a year it occasioned considerable excitement among the boys, so much in fact, that manager Norris sent a messenger to the home of the absentee to inquire if he was sick. The boy returned with the information that Mr. Skelton was the happy father of a 13 pound youngster.

The force of the Washington, D. C., Mutual Union office is composed of the following well-known telegraphers: Lew. W. Smith, Wm. Andrews and J. W. Collins, Washington; W. B. Upperman, National Associated Press, Washington; Fred A. Kent and J. J. Crawford, New York; Robert McMullen, Harry Jones and E. Bernard, Cincinnati; H. C. Halstead, Springfield; Geo. R. Callum, Richmond, Va., and Washington. Other equally prominent names will soon be added.

The W. U. office at Bloomington, Ill., both receiving and operating rooms, is on the second floor of the building. One would think that in a city of 20,000, with rents comparatively low, the company might accommodate its customers by having at least the receiving department on the ground floor. Mr. A. T. McElhiney is manager of the Bloomington office, assisted by Mr. D. Crain, recently manager of the A. U., same city, and formerly in the telegraph instruction business at Kansas City.

Mr. Tom Yearnshaw (an old-timer) is manager of the Des Moines (Iowa) W. U. office. Mr. John J. Chaddick, of Chicago, has been lately appointed chief operator, and Mr. Fred. A. Howard, of Minneapolis, night chief and press operator. Mr. Ernest Howard has charge of the Board of Trade, and Mr. Bob Dickinson of the delivery department. The office has nineteen wires and soon expects another Chicago wire. The Legislature, which meets in January, will make it hot for the boys, but all appear prepared to put on a bold front to meet it.

"The Deming (N. M.) office," says a correspondent, "doubles with San Francisco, taking nearly all their Eastern business, also sending Western business from the East, doubling with Kansas City. We handle an immense amount of work during the twenty-four hours, and the way in which business is turned out here is something to be proud of. Manager Ben. E. Meredith, of Corsicana, Texas, has taken charge here. Our night chief, Mr. Frank Steele, is a perfect gentleman in every respect. The operating force consists of Mr. Jack Swift, Mr. Davis, late of St. Louis, and Mr. W. G. Ingram."

ALBANY, N. Y.—Mr. George Smith, formerly chief operator in the A. & P., and since the consolidation an operator in the W. U., has been appointed chief operator of the M. U. office, this city. Mr. Smith is quite popular, and well qualified to fill the position. The office is under the management of Mr. Chrales Arnold, late manager of the W. U. Lake George office. Mr. Arnold is a shrewd and enterprising business man, and will, no doubt, get a large portion of the business. Mr. Charles E. Shelley, of the Albany W. U. office, was married on the after-

noon of Nov. 3 to Miss Kate Hagadorn. The happy couple were the recipients of an elegant silver tilting ice-pitcher and goblet.

Charles H. Billings, who was recently discharged in Cincinnati, is known as the "champion talker." About six weeks ago, at a meeting of the Brotherhood of Telegraphers in that city, he was compelled to resign as a member of that body for talking unauthoritatively. He has shown the newspaper reporters sworn statements of exoneration. He also says that even Superintendent Miller is not above reproach in such matters. As testimony of this he states that Mr. Miller recently had a telegram in reference to Mutual Union wire repeated to Mr. Bates for the latter's information. "Superintendents" adds Mr. Billings, "would do almost anything they could to promote their standing in the estimation of their superior officers, as is shown by Mr. Miller's action. That man had no more right to look at that private message than would a superintendent of an express company to examine the contents of a package placed in his custody for shipment."

Two New York operators who worked the wire with Billings were discharged last week.

ROUNDT, N. Y.—Alfred G. McCausland, who has been Supt. of Telegraph and Train Dispatcher for the Ulster & Delaware and Walkill Valley railroads for the past eight years, has resigned his position to accept a better one with the W. & N. R. R. Co. at Wilmington, Del. Mr. McCausland has been an energetic, competent and faithful official, and leaves behind him many warm friends who will recall with pleasure the kind and considerate manner in which he treated all who came in contact with him.

Wm. Montalvo, asst. operator in the W. U. office, this city, has been appointed Train Dispatcher, *vice* Mr. McCausland. Theo. McAllister, of Rhinebeck, fills the vacancy in the W. U. office, where Harry Blanchard is still Manager.

## MARRIED.

LINCOLN—ROUNDS.—Nov. 23, 1881, Mr. W. H. Lincoln, of Boston, Assistant Manager Nat. Bell Telephone Co., Portland, Me., to Miss Mary M. Rounds, of Portland.

FRANK—KENNEDY.—At Bowdoin Square Baptist Church, Boston, Nov. 27, 1881, Mr. Leroy M. R. Frank, of Albany, N. Y., to Miss Alice M. Kennedy, of Boston.

BAIR—SCHWAB.—At the residence of the bride's parents, Pottstown, Pa., Nov. 10, by the Rev. D. K. Kepner, Mr. T. Walter Bair, operator W. U. Tel. Co., Philadelphia, to Miss Annie M. Schwab, of Pottstown.

SCOTT—CAIRNS.—at Prescott, Ont., Nov. 2, by the Rev. T. G. Williams, assisted by the Rev. Mr. McGill, W. H. Scott, Agent Bell Telephone Co., Montreal, to Mary, second daughter of Mr. James Cairns, of Prescott.

## THE FITCH CHLORINE BATTERY.

PATENTED SEPT. 16, 1879.

The cheapest, cleanest, most economical, durable and decidedly the

**Best Open-Circuit Battery**

in use for Telephones, Annunciators and Electric Bells. After several years of constant use, it is pronounced to-day as being far superior in constancy and power to all other batteries for the above purposes, notwithstanding all statements to the contrary. We have made several valuable improvements in this Battery, among which is the substitution of a non-corrosive and adjustable clamp, in place of the old style lead cap, which warrants us in saying that the Chlorine Battery has no equal in the market, and all we ask is a trial.

**Price, \$1.50 per cell.**

Liberal Discount to the Trade.

## THE "LONG DISTANCE"

### Patent Electric

No Limit to the Distance.

### CALL BELL.

it can be Operated.

OUR NEW PATENT CALL BELL and has points of merit not possessed by the perfection of convenience; requires a ous assurance to the sender that his call of the line, and the construction is such that a break in the line is IMMEDIATELY INDICATED AT BOTH ENDS BY THE AUTOMATIC OPERATION OF THE BELL.

is constructed on entirely novel principles, any other electric or magneto bell. It is minimum of electric force, gives instantaneous assurance to the sender that his call of the line, and the construction is such that a break in the line is IMMEDIATELY INDICATED AT BOTH ENDS BY THE AUTOMATIC OPERATION OF THE BELL.

We are ready to supply the above call to Telephone Companies, Exchanges, Private Lines, or to any one wanting a CHEAP, DURABLE AND THOROUGHLY EFFICIENT ELECTRIC BELL.

Owners of the U. S. Phosphor-Bronze Patents. Sole Manufacturers of Phosphor-Bronze in the United States.

# PARTRICK & CARTER'S TELEGRAPHIC SPECIALTIES.

## THE "LATTIG" [AUXILIARY LEVER NON-STICKING] KEY.

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very finely finished, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the indorsement of the best operators in the country. It embodies the only true principle to prevent a key from sticking, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of sticking keys. We claim this key will never fail to make contact.

## "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY OF BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

## The Giant Sounder Perfected.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

## Champion Lightning Arrester.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

## Premium Learners' Apparatus.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Send stamp for catalogues, price-lists, etc., for Telegraph Instruments and Supplies, Electric Bells, Electro Plate Supplies and every description of Electrical Apparatus Manufactured.

SEND FOR OUR PRICES BEFORE PURCHASING ELSEWHERE.

PARTRICK & CARTER, 114 South Second St., Philadelphia, Pa.

# ALUMINUM GOLD WATCHES.

A \$15  
WATCH  
FOR  
\$10.

During the past year, we have had many enquiries for a **Stem Winding and Stem setting Watch**, one that could be relied upon, sufficiently attractive for a gentleman to carry and that we could sell at a price low enough to come within the reach of those whose duties compel them to carry a **correct time-keeper**, but whose circumstances will not admit of their purchasing a high priced watch. After going over the whole field of American Manufacture and not finding a watch that would "Fill the Bill" we concluded to look over foreign markets. A member of our firm visited England, France, Germany and Switzerland. In the latter country, he found just what we wanted: **A STEM WINDING WATCH WITH FINE JEWELLED NICKEL MOVEMENT**, (equal to those put up in Gold Cases and sold in this Country at \$100 and \$150.) By giving a large order, we got the price reduced so that we could use them in our trade. The next step was to find the right kind of case for the new watch. Armed with a letter of introduction to Professor Lorschfield (the discoverer and only manufacturer of the celebrated metal known as **Aluminum Gold**), an interview was obtained. Specimens of the metal were exhibited and also numerous articles manufactured therefrom. The Professor also exhibited with much pride, two grand prize medals awarded at the International Expositions held at Paris, for the marvelous resemblance of the metal to gold, and also for its lasting brilliancy. The interview resulted in our giving an order for cases to be made from his **Aluminum Gold**. We have them made both in round and mansard style and they are elegantly engraved or engine turned, and are unsurpassed in beauty of workmanship. The Watches are manufactured of the best material, and finished by skilled hand labor, and are only equalled by watches costing ten times as much. They are perfect time-keepers and fully guaranteed, and that they are in every respect as represented, the thousands of testimonials received from our customers amply attest. Price of Sample Watch by Registered mail, **\$15.00**. We will send the above watch to any person who orders with the intention of acting as agent, or who will recommend it to his friends, on receipt of **Ten Dollars**.

Gents:—The Aluminum Gold Watch I purchased from your firm three months ago retains its color as brilliant as when first received. I delayed sending my second order because I wished to test the metal. I can now conscientiously recommend them. I enclose \$10.00 for one more Aluminum Gold Watch, same as the first. M.M. Watts, Hawthorn, Fla., Nov. 2d, 1881.

Gents:—The second lot of \$10.00 Aluminum Gold Watches received all right. I enclose Money Order for five Stem Wind Aluminum Gold Watches, and other watches and goods from your Catalogue. Forward at once and oblige, George P. Wilson, Grand Forks, Dakota, Oct., 30th 1881.

Gentlemen:—The Aluminum Gold Stem Wind Watch I purchased from your firm is as good a time-keeper as I ever saw on account, the balance can be paid at the Express Office when the watch is delivered. Let us hear from you with an order. C. A. Walker, Eastman, Ga., September 18th, 1881.

Gents:—I sold the Aluminum Gold Watch for \$65.00. I enclose the money for another watch. Yours, Respectfully, T. D. Cooley, Dealer in General Merchandise, Williamstown, S. C. March 9th, 1881. Send money by Post Office Money Order, or Registered Letter. We will send the watch C. O. D. if Two Dollars is sent.

**The Tonic Extract of Wheat** improves weak digestion, cures sleeplessness, nervousness, constipation, loss of appetite and power. Especially adapted to repair brain waste from study, care or grief. Prevents and cures Bright's disease, diabetes, uterine weaknesses, rheumatism, neuralgia and all malarial diseases. Strengthens to overcome evil habits. Adapted for table use. \$1 each, or six bottles for \$5. Sample bottle 50c.

**The Fibrin and Wheat** restores the confirmed dyspeptic stomach and cures all forms of long standing nervous debility. Vitalizes weakly children and energizes old age. Sure preventive and cure for diphtheria, infantile diarrhoea and cholera infantum. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Beef and Milk** is for a very weak condition, and never fails to assimilate, however weak and irritable the stomach. Invaluable for nursing mothers. \$2 each, or six bottles for \$10. Sample bottle \$1.

**The Life Food** is to be taken between meals to relieve sense of "goneness." Never failing remedy for the alcohol, opium and tobacco habit, and for insanity and cancer in their early stages. \$1.50 each, or 6 bottles for \$7.50. Sample bottle 75c.

**A. G. DAY,**

MANUFACTURER OF

**Kerite Insulated Telegraph  
Wire and Cables.**

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

**Eminent Electricians and Practical  
Telegraphists**

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

**Kerite Insulated Wire and Cables**

A DIPLOMA FOR

"Excellence of the Insulation and Durability  
of the Insulator."

For sale by all dealers in Telegraphic Materials.

# A CHEAP, SEASONABLE AND ELEGANT WORK! CHRISTMAS EVERGREENS.

A COLLECTION OF CHOICE

TELEGRAPHIC AND GENERAL POETRY,

SUITABLE FOR A

HANDSOME HOLIDAY PRESENT.

Illustrated by a Frontispiece and Fifty Fine Engravings.

HEAVY TINTED PAPER. CLOTH EXTRA. FULL GILT. PRICE, \$1.50.

**CHRISTMAS EVERGREENS** has been so ENTIRELY RE-ARRANGED, by the addition of much new matter—including a dozen fine cuts and a beautiful frontispiece—that it is now virtually a new book and, the publisher thinks he can safely claim, at least as handsome a volume at the price as has ever been issued by any publisher, American or foreign.

Indeed, an examination will demonstrate that the edition of "Christmas Evergreens" for this year compares very favorably with any of the ordinary three, four, or even five dollar holiday books, either as to contents, illustrations, typographical appearance, paper, printing or binding.

## Telegraph & Telephone New Year's Calling Cards, 1882.

For the last four years we have prepared each year New Year's Cards for telegraphers. Our object has been to give the fraternity a distinctively telegraphic New Year's Card, one that was neat, pretty, appropriate; different from any other New Year's Card, and so unique and handsome as to attract attention and deserve preservation. Our success has been much greater than we could have expected, and this year we have, in addition to those for telegraphers, also one for telephone men.

### PRICE LIST.

25 cards, with one name, mailed to any address on receipt of	\$ 35
50 cards, with one name, " " " " " "	50
25 cards, without name, " " " " " "	25
125 cards, without name, " " " " " "	1.00

Cards furnished by the thousand at special rates.

There will be no delay in filling orders. The cards will be mailed in each case as soon after receipt of the order as it is possible to have the name printed. Order early. U. S. postage stamps taken. Samples of either the Telegraph or Telephone Card mailed on receipt of 2c. stamp. Samples of New Year's Cards and messengers' addresses on receipt of 3c. stamp.

25 New Year's Cards, with name, or 25 Messenger Addresses, will be mailed free to any one sending us two yearly subscriptions for THE OPERATOR. Their own and that of a friend will do.

## Telegraph Messengers' Christmas and New Year's Greeting, 1881-82.

These addresses can be used either at Christmas or on New Year's day, as the messengers many prefer. They are suitable for the messengers of ANY telegraph company. They are for presentation to patrons of the telegraph, merchants and others; and messengers will find them neater and handsomer than anything of the kind heretofore used for this purpose, and cheaper than they could possibly get them printed for in their own towns.

### PRICE:

25 Copies, postage prepaid, only	\$0.35
50 Copies, " " " "	0.60
100 Copies, " " " "	1.00
250 Copies, " " " "	2.25
500 Copies, " " " "	4.00
1,000 Copies, " " " "	7.00

Order early; U. S. postage stamps taken. Samples mailed on receipt [of a 2c. postage stamp. Sample of both the Messengers' Address and of the New Year's Cards will be mailed on receipt of a 3c. stamp.

Messengers are recommended to order a supply of our Telegraphers' New Year's Visiting Cards, with their name printed on them, to be presented in connection with the Messengers' Address. We will send 25 addresses and 25 cards on receipt of 60c; 50 addresses and 50 cards on receipt of \$1.00, or 125 addresses and 125 cards on receipt of \$2.00.

Address,

W. J. JOHNSTON, Publisher,

No 9 Murray Street, New York.

**A SPLENDID BREECH LOADING SPRINGFIELD RIFLE** FOR ONLY \$7.50.  
MADE BY PARKER SNOW & CO  
MERIDEN CONN

WEIGHT 8 lbs  
LENGTH OF BARREL 32 INCHES  
**ONLY \$7.50**  
SIGHTED FOR 600 YARDS WILL CARRY 1,000 YARDS.

**Nº 1 BREECH OPEN** **Nº 2 BREECH CLOSED**

### A BRAND NEW RIFLE FOR \$7.50

We have recently purchased the entire stock, and have obtained sole control of one of the cheapest and best Rifles ever made for the money, as shown in the above illustration, and in order to rapidly introduce them into the United States and Canada, we have concluded to sell a limited number at **ONLY \$7.50**. There are few rifles in the world that can do more effective work than this reliable weapon, and its death dealing qualities are unsurpassed by few if any rifles made. It will carry 1000 yards. The breech is constructed upon a superior plan, is perfectly safe, and fitted with an AUTOMATIC CARTRIDGE EJECTOR; and it has been fired 45 times in one minute. In order to protect ourselves against dealers ordering by the hundred, at the price named, we shall insert this advertisement but one time in this paper, so you should immediately CUT THIS ADVERTISEMENT out and forward it to us with your order. We alone control this Rifle, you cannot purchase them of any other dealer, and it must not be confounded with any cheap Rifle now advertised. We are a firm of REGULAR GUN DEALERS, well known throughout the country and mean exactly what we say. Cut No. 1 shows the open breech; and No. 2, the breech closed. This is not a second-hand Rifle, but it is brand new and thoroughly tested. The regular cost price for manufacturing these Rifles is \$12.50, and has been regularly sold at \$17.00; indeed, we are prepared to prove, that at one time \$16. EACH WAS OFFERED FOR A 10,000 LOT OF THESE RIFLES, and the offer was refused. Remember, though you may not want this Rifle for your own use to-day, you may need one at a future date, but you must order now or never, for this offer will not hold good after March 31st, 1882. REMEMBER, this is a SPECIAL OFFER, and to secure one of these Rifles you must send us this advertisement and \$7.50. Two sent for \$14, four sent for \$25, six sent for \$33. Speculators should order immediately. In each case this advertisement must accompany the order, but we cannot send more than six Rifles, at the price named, to any one address. You can sell these Rifles readily at \$10 to \$20 each. IN EVERY CASE should you not be satisfied with your purchase, WE WILL REFUND THE MONEY. Should you desire it we will send you the Rifle for inspection, by express, allowing you to examine it at the Express Office, and accept or refuse it, upon receipt of \$2, to guarantee us against loss of express charges. If you accept the Rifle, this will leave you but \$5.50 to pay. Remember this is not a toy Rifle, not a catchpenny, but a regular long range Rifle, good for small game, deer, buffaloes, wild geese, bears, or burglars, road agents and Indians. When you send the full amount of \$7.50, with your order, we will send you a box of 40 ball cartridges free. The cartridges cost 50c. per box of 20, and can be purchased of us or ordered of any dealer. A steel cleaning rod accompanies each Rifle, and we guarantee the Rifle to be safe, accurate, strong, and reliable. Upon receipt of \$1 extra we will send a handsome double leather cartridge belt, with neck and waist strap (usually retailed at \$2.50). Order immediately. Handsome catalogue of good, cheap guns, rifles, and revolvers sent free. Send money by money order, registered letter, or draft, at our risk. Reference we refer to Agents of Adams Express Co., American Express Co., United States Express Co., National Express Co., or any bank or business house in this City.

Address **SAXON IMPORTING CO., 116 Chambers St., New York.**

N. B.—We have a job lot of new Remington Rifles and Spencer nine-shot Magazine Carbine Rifles, and will dispose of them at the following prices: a Remington Breechloading, brand new Rifle sent for \$12; or a Spencer Magazine nine-shot Carbine Rifle, sighted for 900 yards, for \$12. Only a limited number on hand. Order early.

**AN ELEGANT GIFT**

What makes a more Beautiful Gift than a **SPARKLING DIAMOND**? We can think of nothing, and with this idea in mind, we have during the dull months of the past season, employed our Diamond Setters in making up a line of **SOLID GOLD JEWELRY**, and using our justly celebrated **French Diamonds** as settings. If you desire a beautiful ornament for yourself or wish to make a handsome present to some friend, now is your chance to procure a limited number of the articles illustrated in this advertisement at a **VERY NOMINAL PRICE**.

**DESCRIPTION OF ARTICLES**—No. 1, a Solid Gold Ring, solitaire, French Diamond. No. 2, a Solid Gold Ring, seven French Diamonds. No. 3, a Solid Gold Ring, three French Diamonds. No. 4, a Solid Gold Ring, five French Diamonds. No. 5, a Solid Gold Ring, three French Diamonds. No. 6, a Gent's Scarf Pin, one French Diamond, Solid Gold setting (we show in illustration but about 14 the length of the Pin. No. 8, a Gentleman's Shirt Stud, Solid Gold setting and spiral, single French Diamond. No. 7, a Pair of Ear Drops, French Diamonds, Solid Gold setting and wires. **Remember, all the above described goods are SOLID GOLD.** We wish to caution you against the many firms who are advertising cheap and worthless jewelry. Our goods are just as represented and if you are dissatisfied after receiving anything we advertise your money will be refunded. Our prices for the above described articles, shipping charges prepaid, to any address in the United States, until March 31st, 1882, will be as follows: (provided, however, that when you order you will cut out this advertisement and enclose with the money you send us) We will send either No. 1, 6, or 7, upon receipt of \$1.65; or, upon receipt of \$2.15, we will send either No. 3, 5, or 7; or, upon receipt of \$2.60, we will send No. 4; or, upon receipt of \$2.55, we will send No. 2. Our object in offering a few styles of our Solid Gold Jewelry at the above nominal prices, is to secure permanent customers for our other goods. We can only send a limited number of these goods at the prices named, and to protect ourselves against jewelers and others ordering in quantities, we will insert this advertisement but one time in this paper, hence, require you to cut it out and send to us, with your order, that we may know you are entitled to the benefit of this offer. Remember, we will not send more than two articles for each advertisement sent us. You can make a selection of any one or two articles, and order them at above price, but should you wish to purchase more, we will furnish them at prices given in our catalogue which we will mail you at the time we forward your goods. We could never make the above offer unless we felt sure that you would be so highly pleased with our goods, that you will not only become a regular customer yourself, but will influence your friends to purchase from us by showing the beautiful jewelry we send you, at the same time exhibiting our catalogue to them, and in looking it over, we know by experience, ten chances to one they will find something they want. The French Diamonds we use as settings in our Solid Gold Jewelry are of our own importations, they are cut from the whitest stone, and exact proportions as the natural gem; they are very brilliant, and in fact we defy any one to detect them from the real Diamond. If you order a ring we will handsomely engrave any initial, name, motto or sentiment on the inside without extra charge. To ascertain the size ring you wear, cut a slip of paper so as to just meet around your finger and send to us, always state in your order what engraving you wish. Cut this advertisement out and send to us before March 31st, 1882, as it will not appear again. Send money by registered letter, money order, or draft. Postage Stamps taken. As to our reliability we are well known throughout the U. S. or you can write to any Bank or Express Co., or have your friends call at our elegant salerooms in this City.

Any of the above promptly mailed, postage prepaid, on receipt of the price.

Experience has demonstrated that the best selling books we publish are

WORDSWORTH,

CHRISTMAS EVERGREEN,

TALES AND HISTORY,

THE DICTIONARY,

WIRED LOVE AND

OAKUM PICKINGS.

That agents may be equipped for taking orders at an insignificant cost, we will send all of these books, each bound in cloth, for use as samples, prepaid, on receipt of \$5 (regular price \$8).

"THE OPERATOR" for fifteen months can be added to the above for one dollar extra.

Any of the above works forwarded, **POSTAGE PREPAID**, to any address in the United States, Canada, Mexico, England, France, Australia, or any country in the Universal Postal Union, on receipt of the price. Remit by Post-Office order, draft, registered letter or express. U. S. Postage stamps taken. Address,

**W. J. JOHNSTON, Publisher,**

No. 9 Murray Street, New York.

**HALF ROUND RING.** **BAND RING.**  
A ROLLED GOLD SOLID RING makes a Beautiful and Valuable Gift for a Lady, Gentleman or Child, and in order to secure new customers for our firm we will forward, post-paid, to any address in the United States, one of our Heavy 18 K. Rolled Gold Rings (either in plain band, half round or handsome stone, set in either Amethyst, Topaz or Garnet) on receipt of only 75 Cents each, and if you wish we will engrave any name, initials, motto or sentiment desired, on the inside of the ring without extra charge, provided you cut out this Advertisement and mail to us with amount before APRIL 30th, 1882. At the same time we send your ring and will mail you a bundle of our catalogues and feel sure that you will be so highly pleased with the ring, and that it will give such satisfaction, that you will oblige us by distributing our catalogues among your friends, at the same time showing them the beautiful ring you have received from us. You can in this way assist us in selling other goods of standard quality, which are manufactured from new and original designs, and which we guarantee to give satisfaction.

**Our Future Sales is our Profit!**  
Remember, the ring we send you is heavy 18 K. Rolled Gold, and that this unprecedented offer is made only to introduce our goods and catalogues in your vicinity. Our firm is well established and reliable, manufacturing first-class goods from the

## PRECIOUS METALS.

We can only send out a limited number of rings at price named, and to protect ourselves from jewelers and dealers ordering in quantities, we will insert this advertisement but one time in this paper, hence require you to cut it out and send to us, so that we may know you are entitled to the benefit of this offer. Under no circumstances will we send more than one ring of each kind to any person sending us 75 cents each, and this advertisement; but after you order, and other rings are desired, we will furnish 18 K. Solid Gold Rings at prices given in our Illustrated Catalogue, varying from \$3.75 to \$9.00 each. If you wish one ring send this advertisement and 75 cents; if you desire two rings send \$1.50 and this advertisement; or if you wish three rings send this advertisement and \$2.25; if more than three are desired you must pay full price as given in our catalogue. To ascertain the size ring you wear, take a piece of paper and cut it so that it will just meet around the finger you wish to wear the ring on, send the slip to us, and we will send

a ring to fit you. State which you want, the Band, Half Round, or Stone Ring, if you order a stoning, state which you want, Amethyst, Topaz or Garnet, and also state what you wish engraved on the inside. Cut this Advertisement out and send to us, before APRIL 30th, 1882. Postage stamps received same as cash. You can send small amounts at our risk, or send by money order or registered letter.

This Wire possesses the highest electrical conductivity, which is necessary to make Telegraph and Telephone lines work with certainty and ease. Special attention given to

Telephone Wire,

for which No. 12 is the average size used.

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

## PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz.:

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment: but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, placque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

**DIRECTIONS FOR USE.**—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

**PRICE, \$1.25 PER CELL.**

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**

**A 32 CALIBRE \$10.00 REVOLVER FREE TO EVERY READER OF THIS PAPER.**

## READ THIS

About a month ago we made an offer through the Newspapers of a 32-Calibre BLUE JACKET Revolver, and a subscription to the "HOUSEHOLD GUEST MAGAZINE" FOR ONE YEAR, for the then unheard of low price of \$2.00. We had 5,000 of the 32-Calibre BLUE JACKETS nearly all of which have been sold, (or rather given away). They have given such universal satisfaction, and we have received so many high testimonials, together with thousands of calls for a heavier calibre revolver that we have decided to offer our World Renowned 32-Calibre BLUE JACKET for a limited time for the low price of \$3.50. The 32-Calibre BLUE JACKET is without exception the most elegant and beautifully finished revolver in the world. Every Revolver is guaranteed in every respect. They are made of the finest steel. The barrel and frame are finest Nickel silver-plate, and the Cylinder and Base Pin are of the finest Gold-plate. Every Revolver is BEAUTIFULLY ENGRAVED. The engraving is then BEAUTIFULLY ENAMELED in blue by a patent process, owned by us. The frame near the handle is set in imitation of beautiful rubies, making a contrast of GOLD, SILVER, BLUE and RUBIES, which taken together with the IVORY HANDLE make it simply BEAUTIFUL BEYOND DESCRIPTION. It must be seen to be appreciated. No pen can picture its beauty or describe its actual merits. The name BLUE JACKET is enough to stamp it as a first-class weapon in every respect. It has the New Russian Model Hip Stock exactly fitting the hand, enabling one to hold it firmly and steadily. We guarantee its Shooting Qualities equal to a SMITH & WESSON OR COLT, and for beauty and durability it cannot be equalled. The Cylinder is provided with a Positive Stock Action holding it firmly in place. It uses the Long 32-Calibre Cartridge making it one of the Strongest Shooting Revolvers in the world. It is the special terror of burglars, highwaymen and tramps. We pledge our reputation that it is the first 32-Calibre Ivory Handle Engraved, Nickel and Gold-Plated Revolver ever sold for less than \$10.00, and the ENAMELED and RUBY FINISH is the FIRST EVER SEEN ON ANY REVOLVER. We purchased these Revolvers partly finished at less than the raw material cost and had them finished as above described for this special purpose, and we hereby guarantee over our own signature to refund money for each and every Revolver found to be different from what we represent it. FOR THREE DOLLARS and FIFTY CENTS, and TWENTY-FIVE CENTS extra to help to pay postage and packing expenses. We will mail this Revolver to any part of the world, and in addition will enter your name on our Subscription Books for a year's subscription to OUR MAMMOTH PUBLICATION, THE HOUSEHOLD JOURNAL. The Journal contains 24 Large Pages, filled with Illustrations, Stories, Sketches, Adventures, Poetry, Anecdotes, Farm and Garden Statistics, The News, Etc. This offer holds good ONLY TILL MARCH 1st, 1882, or until our stock is sold out, after which time we shall be obliged to charge more than double what we do now. Should our stock run out before THAT DATE, WE CLAIM THE RIGHT AND PRIVILEGE of returning your money. As we have only Ten Thousand, we would advise you to order now, as past experience teaches us that they will soon be sold. FREE TO ANY ONE. We will give this Revolver FREE to any reader of this paper who will CUT THIS ADVERTISEMENT OUT, show it to their friends and get six orders at \$3.75 each. After you have done this send us \$22.50 the price of Six Revolvers and we will send you one Revolver and a subscription to THE HOUSEHOLD JOURNAL FREE FOR YOUR TROUBLE, and each one in your club will also receive the Journal a year. THE BEST WAY is to order one for yourself first and show it to your friends, you will then find it easy to get others to order, or if you desire to speculate, you can easily sell these Revolvers for \$10.00 each. As to our reliability we refer to any Commercial Agency, newspapers, Publishers, or Express Companies in New York City. If this is not sufficient, write us for references which we will cheerfully furnish. Send all Money by REGISTERED LETTER or POST OFFICE ORDER at our risk. When one or more are ordered by Express, at \$3.75 we put in a Box of Cartridges with each Revolver.

**THE WORLD RENOWNED BLUE JACKET**  
 IVORY HANDLE  
 GOLD PLATED  
 CYLINDER  
 ELEGANTLY ENGRAVED AND ENAMELED  
 WEIGHT 12½ OZ.  
 THIS CUT IS THREE FOURTHS SIZE.

A BOOK THAT SHOULD HAVE A PLACE IN EVERY TELEGRAPH OFFICE.

## THE AMERICAN POPULAR DICTIONARY:

CONTAINING

Every Useful Word to be found in the English Language.

WITH ITS

TRUE MEANING, DERIVATION, SPELLING AND PRONUNCIATION

ALSO A VAST AMOUNT OF

ABSOLUTELY NECESSARY INFORMATION

UPON

SCIENCE, MYTHOLOGY, BIOGRAPHY, AMERICAN HISTORY, CONSTITUTIONS, LAWS, LAND TITLES, CITIES, COLLEGES, ARMY AND NAVY, RATE OF MORTALITY, GROWTH OF CITIES, INSOLVENT AND ASSIGNMENT LAWS, DEBTS, RATE OF INTEREST, AND OTHER USEFUL KNOWLEDGE.

BEING A

## PERFECT LIBRARY OF REFERENCE.

510 PAGES. STRONGLY BOUND IN CLOTH. PRICE ONLY \$1.

The publisher of the AMERICAN POPULAR DICTIONARY claims for it the support of telegraphers and the public, for the following among other reasons: It contains every word of the English language that enters into speech or writing.

The Spelling of each word is that given by the best authorities.

The Definitions are compiled from a majority of the best writers of the English language.

The Pronunciation of every word is that settled upon by the ablest scholars.

In addition to the perfections of this work as a Dictionary, it contains a vast amount of information upon many kinds of useful information not to be found in any similar work; but all absolutely necessary to every one who wishes to be acquainted with the leading subjects of conversation and composition.

TELEGRAPHERS, more than any other class of men, need a good and handy Dictionary in their office at all times. There is no Dictionary published that will give them better satisfaction than The American Popular.

Dictionaries printed in England are of little use in this country, where many words are differently spelled, and the meaning not always the same. Send for the American Popular Dictionary, and get the best Dictionary at the price published.

The American Popular Dictionary is printed from new type, with extra clear and legible face, and handsomely bound in cloth and gilt. From it a speaker or writer can glean an amount of knowledge impossible to find elsewhere collected in one book.

Worth ten times the price.—N. Y. Times.

A perfect dictionary and library of reference.—Lester's Illus. News, N. Y.  
 We have never seen its equal, either in price, finish or contents.—Chris. Advocate.

Copies promptly mailed, postage prepaid, on receipt of price, \$1, in currency or postage stamps, or by Post Office order. Liberal discount to agents.

Four copies by mail or express, prepaid, \$3.00.

THE OPERATOR for fifteen months and the Dictionary, only \$2.00.

The size and shape of "Tales and History" having been very favorably commented upon, we have now issued NEW EDITIONS of those other two popular books—"WIRED LOVE" and "OAKUM PICKINGS"—uniform with "TALES AND HISTORY," and will mail all three books, bound in CLOTH and uniform in size, postage prepaid, on receipt of.....\$2.00

The three books and THE OPERATOR one year, or any of our other \$1 books..... 2.75

The three books, THE OPERATOR one year and the Dictionary, or any other \$1 book..... 3.50

"Tales and History," "Wired Love," "Oakum Pickings," The Dictionary, "Lightning Flashes," "General Grant" and "Sam Johnson," all cloth, with THE OPERATOR, one year (regular price \$7.50), will be forwarded, prepaid, to any address on receipt of \$5.00.

Address: W. J. JOHNSTON, Publisher,

## Leclanche Battery.

(PATENTED.)

"Prism Battery" Complete.

—THE—

## GREAT TELEPHONE BATTERY.

The Realization of

SIMPLICITY AND EFFICIENCY

## In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

ADOPTED AND USED BY THE

American Bell Telephone Company.  
 Metropolitan Telephone and Telegraph Company.  
 Western Union Telegraph Company.  
 Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words Pile-Leclanche stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

The Leclanche Battery Co.,

40 West 18th St., New York.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.

## Invaluable Adjunct of Every Well-Regulated Fire Department.

THIS IS THE ONLY

## PERFECT, COMPLETE AND RELIABLE SYSTEM of Fire-Alarm Telegraph in the World.

### WHAT IS SAID OF THE GAMEWELL SYSTEM.

From a very large number of testimonials on file we select the following, as sufficiently evidencing the high estimation in which the American fire-alarm telegraph is held by those who have fully tested its practical working:

#### BOSTON.

I take great pleasure in adding my own testimony to the great value and success of the telegraph fire alarm; and I feel confident in saying that wherever once tried it will thereafter be deemed indispensable.

ALEX. H. RICE, Mayor of Boston [1856].

#### ST. LOUIS.

The superintendent of the fire-telegraph of St. Louis, in his report for 1860, says:

"A comparison of the two years' working of the department, prior to the establishment of the electric alarm, with the two subsequent ones, shows the following results: From April, 1856, to April, 1858, there were 568 alarms, of which 175, or nearly one-third, were false.

"The losses by fire during the same period show greatly in favor of the last two years. From 1856 to 1858 the amount of losses was \$1,803,315 against \$710,404 from 1858 to 1860, showing a diminution of \$1,097,911, or a sum equal to \$548,955 annually; and, on the principal that prevention is better than cure, we claim for the fire-alarm telegraph a large share of the credit in saving that amount."

#### TWENTY-ONE YEARS LATER.

The same official in his report for 1881 says:

"In 1858, when the Electric Telegraph, as applied for fire alarm purposes, was in its infancy, the nucleus of the present system was introduced into this city. It was accepted by the authorities with considerable misgiving as to its practical utility, and it was looked upon generally as an experimental adventure, involving quite a sum of money. As time passed by, however, it gradually began asserting itself; skepticism as to its practical value faded little by little, until finally, guided by scientific research and mechanical improvements, it stands before the world to-day as being one of the most valuable achievements of man."

#### ALBANY.

In this city we would much prefer to have four steamers with the telegraph than eight steamers without it; and the same will hold good in any city. JAS. H. MCQUADE, Chief Albany Fire Department.

The fire-alarm telegraph is in complete order, and has worked most satisfactorily during the year. In fact, it has never failed since its construction. It is a most valuable auxiliary to a fire department; for, in truth, without it, it would be unable to maintain the high degree of efficiency shown in our organization. Always reliable, the citizen feels assured that within a few minutes after the discovery of a fire the means will be at hand to extinguish it.—Report of Albany Fire Commissioners, 1874.

#### MONTREAL.

As the simplest illustration of its great value, we have the fires and loss for a fair average year, before and since its introduction.

Before, 85 fires...	\$140,088 loss.
Since, 99 fires.....	35,428 loss.

A. BERTRAM, C. E. F. D. [1866].

The cost of construction will, of course, depend upon the amount of apparatus required and the extent of territory to be covered. But we have placed the prices of fire-alarm telegraph within the means of all towns, either large or small, willing to expend from \$500 upward to tell their Fire Department on the occurrence of a fire instantly and exactly where it is.

### BREAK! BREAK! BREAK!

(Adapted from Tennyson.)

Break! break! break!

On the busiest wire, oh! Plug,  
And I would that this key could batter  
The nose off thine ugly mug.

Oh! well for the line repairer]  
That he plods on his way undeterred,  
Oh! well for the managaire,  
And his respectfully referred!

And the duplex men work on  
With unmolested din,  
But on the busy long-way wire  
Thou eternally chippiest in!

Break! break! break!

On the busiest wire, oh! Plug,  
And perhaps I may have revenge some day,  
And batter thine ugly mug.

POD.

### The Paris Electrical Exhibition Closed.

[From the Special Correspondent of The Operator.]

Contrary to the published notices, the closing of the Electrical Exhibition was postponed until Sunday evening, Nov. 20. The extra five days were devoted to charitable ends. The receipts of the 16th and 17th were distributed among the police forces, French and foreign, who have been employed in the building in the various sections; those of the 18th are to the poor of Paris, while on the 19th and 20th the gates were thrown open to the public without charge. Two nights were also reserved in the telephone rooms for persons who had not heard the opera through their medium and were willing to pay for the privilege at the rate of five francs for five minutes. These telephonic experiments have contributed greatly to the success of the exhibition, and it has been noticeable throughout that the crowd was always largest on opera nights. The many projected electrical shows that we begin to hear of will do well to copy this feature. M. Adet, whose system is used, received a *diplome d'honneur*.

The postponement of the closing met with much opposition from the exhibitors in different sections, and nearly all protested against it, claiming that if the administration wished to make a charitable affair of it they should do so at their own expense, and devote the five days between the 10th and 15th to it. The authorities replied that, inasmuch as the opening had been delayed eleven days on account of the exhibitors not being ready with their goods, they should not object to returning the compliment by remaining five days over time.

I should think that the few Americans who are represented here would have cause to be well satisfied with the results obtained. The Brush, Weston and Maxim electric light people have sold their rights; the Edison folks are now looking for a site to build a factory, and are going into the manufacture of lamps and machinery on a large scale. Mr. Chas. Batchelor will have the management, and nearly all of those who are connected with him here who came from Menlo Park will remain in Europe. The Dolbear telephone has been taken by some private parties who are now organizing a company to introduce it in Europe. Mr. Albert Stetson and Mr. Buck remain as Professor Dolbear's representatives. Gray's Harmonic system has been disposed of to a syndicate who have obtained the European rights, and will commence its exploitation as soon as new instruments arrive from America. Mr. F. W. Cushing remains in Europe in connection with it. Connolly Bros. & McTighe's Automatic Telephone Exchange has been sold, and the Messrs. Connolly will attend personally to its introduction. A company has been formed to exploit the Dion bobbin, which I have already described, and others take the Pond indicator and photo-relievo systems, which latter was improved by Edison, and even the switch-board exhibited by the Western Electric Manufacturing Company, as part of their telephone exchange system, is about being sold to the telephone people here. It is unfortunate that American instrument makers did not take the trouble of showing their goods. There have been almost numberless inquiries for prices and information concerning the very few instruments that have been shown as part of some system, and much surprise has been manifested at the absence of such articles. Our American instruments are much neater and simpler than those of European manufacture and are considerably cheaper. Mr. Gilliland, formerly of Indianapolis, is now in Europe looking for a site for a factory, and will probably decide upon Antwerp as the most eligible spot. He represents the Consolidated Western Manufacturing Company.

Professor Bell's induction balance and first telephone have just arrived and been placed on exhibition. They could only be shown for five days, when the closing of the exhibition necessitated their being repacked and carried away. Professor Bell has another means for locating a bullet in the body. He places a steel plate somewhere on the body and connects a steel probing rod with it through a telephone. When the rod is passed into the wound and touches the lead ball the two metals—of the lead inside and the steel plate outside—form a battery of which the body is the cell, and a sound is heard in the telephone. No sound is heard until the probing rod touches some foreign metal, for the rod itself, being steel, cannot form a battery with the same metal outside of the body. When the Professor was asked why the mistake had been made in the President's body, he said that no mistake had been made, that they had actually located metal, but that it happened to be a steel bed spring in the mattress.

The American exhibitors have clubbed together and presented Mr. Philip Walker, the

Secretary of the United States Commissioner, with a diamond stud, in recognition of his services and gentlemanly attention to their needs, especially during the first days of the exhibition. Mr. Walker has proven himself well worthy of his position, and has in many instances put himself to much personal inconvenience to help others along. This gentleman will be remembered by many telephone men in Boston, where he was formerly employed.

### Telegraphic Colleges.

TWENTY-ONE DOLLARS' WORTH OF FREE ADVERTISING CHEERFULLY GIVEN.

The following extracts from a circular issued by the "Union Electric Telegraph Instruction Company of California," San Francisco, are decidedly creditable to the college brigade:

"Their line is gone through all the earth, and their words to the end of the world."—*Psalm xix*, 4. \* \* The rapid development of the electric telegraph, by the construction of railroads and competing lines, is opening more profitable positions to young men and ladies than any other branch of business in the world. \* \* The salaries paid operators are \$50 to \$60 per month for small stations, \$65 to \$75 for medium stations, and \$80, \$90, \$100 and \$115 for large offices. The hours for attendance in office are eight to ten hours per day. \* \* \*

There is no profession so quickly learned that pays so large a salary as telegraphy. Think of it. There is no profession in which the work is as light or the hours of labor so few as telegraphy.

If all their work could be done at once the operators could finish what they generally have to do each day in two hours; but, as it comes scattered through the whole day, they hardly realize that they have done any work. It is almost like being paid for sitting in a pleasant office and studying or reading. \* \* \* The time required for learning should not exceed fifteen weeks, but, by constant and diligent application, it can be learned by some in less time. \* \* \*

*Superintendents favor our graduates.* \* \* \* We can assure those that engage with us that we apprehend no difficulty in their obtaining suitable positions as soon as qualified. \* \* \* A certificate will be given to each competent graduate which will be, with our personal assistance and influence, a sufficient recommendation to obtain employment as an operator. \* \* \* The business in itself is fascinating in the extreme. The idea of communicating instantaneously a distance of thousands of miles *never loses its charm*. \* \* \*

The study and practice of telegraphy is not tedious, but, on the contrary, to those having leisure hours it would serve as a pastime rather than a task. \* \* \*

The following is an advertisement clipped from the Nashville *American* of Oct. 26, the signature being particularly commended to the attention of General Eckert:

**THE UNDERSIGNED, FEELING THE** want of a practical school of Telegraphy, upon which Telegraph and Railroad Companies can depend for competent and reliable operators, has concluded to open a school in which shall be taught all the requirements necessary to fit a person for practical service. \* \* Under the charge of the undersigned, and the two last will be taught by Mr. Jo W. Fisher.

Applications for terms as pupils should be made to the undersigned, in the handwriting of the applicant, and will not be considered unless accompanied by testimonials from responsible parties as to the intelligence and good habits of the applicant.

School hours—7 to 9 p. m.

The standing of the undersigned can be ascertained from any of the Telegraph offices in Tennessee or Kentucky.

J. B. TREE,  
 Western Union Telegraph Office,  
 Nashville, Tenn.

We also commend "Professor" E. I. Wilson, of Atlanta, Georgia, to the attention of General Eckert. The "Professor" advertises "Wilson's Southern Telegraphic College," and, in the *Georgia State Gazetteer*, informs the world that he is "a practical operator of 25 years' experience, and is now in the employ of the Western Union Telegraph Company, as a receiver of daily Press Reports, at a large salary." This particular telegraphic corpse deliberately lies when he says, "We are in receipt of letters almost daily calling for operators in the West, and also in our own immediate vicinity."

"The Oberlin Telegraph Company," at Oberlin, O., offers to teach students for forty-five dollars, and to board each student for "the first month free of charge," and will "make a written contract with you, in which we will bind our company to procure for you a situation as operator on the completion of your studies, at a salary not less than forty dollars per month."

The "colleges" in St. Louis seem to be particularly well sustained by the officers of the Western Union Telegraph Company, another fact which we commend to the attention of Gen. Eckert. Our St. Louis correspondent writes: The most prominent of these 'colleges' is on the second floor of the Western Union building, and is under the immediate supervision of Professor Prescott (brother of the ex-Electrician-in-Chief). The room, battery and instruments are furnished by the Western Union Telegraph Co., or rather by the management at this place, and, of course, with the full knowledge of Supt. Baker.

"Manager Brown takes especial delight in this department, and has actually extended to some of the lady operators (who handled from 200 to 250 messages per day) the privilege of practicing in the plug factory, after office hours, so that they may become expert and in the near future receive an increase of salary, but Chief Operator Topliff, ON PRINCIPLE, holds most of said ladies salary down to \$30 with a tenacity that is truly wonderful.

"FOUR dollars per month is charged for tuition in the 'factory,' and the number of students is 32. What salary Mr. Prescott receives or how the spoils are divided I am unable to say, but about \$120 per month is divided in some way. Whether or not the Western Union Company receives anything for room, fire, gas and battery power is an open question among the uninitiated.

"The next college on the list is 'The Metropolitan Commercial College,' the electrical department of which is presided over by Sid. Fairchild, night wire chief. I am not informed as to the number he instructs, but understand it is quite considerable. Sid. is the only assistant night chief who is granted immunity from extra work during the day, and the natural inference is that he has the sympathy of the management in his endeavors to turn out a few strictly first-class operators who are willing to work for \$30 per month."

One of the New Orleans operators says the reason he got "Mrs. Morris, care H. Low, 237 Olive street, for Mrs. Morris Carey, No. 1, 237 Olive street," was on account of induction on the Galveston circuit.

### Some Electrical Troubles to be Expected in Telephone Exchanges, and How to Remove Them.

The recipe given by Mrs. Glass for the proper method of cooking a hare, commenced, as is well known in modern history, with the immortal sentence, "First catch your hare."

These words, slightly modified, should be embroidered in letters of gold upon the cardinal red lining of every inspector's hat. They should there be made to read, "First catch your fault." All telegraphic, telephonic or other systems of electrical communication will, in the nature of things, develop faults and defects in working, irrespective of the care or expense involved in construction.

Not all such organizations, however, are brought into such intimate relations with the general public as the telephone exchanges.

Even the gold and stock printing and the district telegraph systems can bear no comparison with the telephone exchange in this particular, because the former deals exclusively with a class of intelligent business men, who are acquainted with the propensity of all machinery to get out of order, and realize that if an instrument is intended to accomplish an ingenious result, it will probably be sufficiently intricate to possess machinery requiring care and attention.

Moreover, the very complication of the stock printer has frequently frightened away from it the meddling amateur, who works so much woe to the Blake transmitter and the magneto bell. It is also evident that the limited use of the stock printer calls for the employment of a smaller number of inspectors, and consequently a much stricter watch can be maintained over them, and a higher class of inspector be readily maintained, while a sufficient number can be always provided to exercise a careful supervision over each individual instrument.

Or, take the case of the District telegraph instrument. It is true that its numbers are legion, but its scope is limited and its use correspondingly so. As it can do but little, its internal arrangements are of the simplest character, amounting only, ordinarily, to a circuit breaker, which may be rotated once, twice or thrice, according to the required signal. Any trouble affecting this instrument, or the circuits employed in connection therewith, can be readily localized and removed by almost any intelligent person understanding the system.

But the telephone is not in every case subjected to the rules we have been brought up in. A heavy escape that will completely incapacitate a line of printers will scarcely affect the magneto bell, and will actually improve the operation of a set of telephones.

In the operation of a telephone exchange, we hear all kinds of voices—the hoarse, gruff voice of the warehouseman; the sharp, imperative baritone of the merchant; the incisive clearness of the lawyer; the dulcet, feminine voice of the young lady at home; and the Bowery slang of the office boy.

All these voices have corresponding pairs of hands and curious eyes attached to their organizations; and all the owners of these same attachments have a vivid consciousness that by turning a screw like this and pressing a spring like that they can materially improve the working of a telephone.

Not the least, by a geographical league, of the troubles that beset the path to glory, as daily trodden by the telephone inspector, is that thorn in his flesh—the amateur electrician—and any patent covering a feasible method for his extermination would prove as valuable as the celebrated Page patent or the Simpson gutta-percha monopoly.

In responding to a complaint of defective service, therefore, the inspector must never be oblivious of the fact that the trouble may be caused by the subscriber himself and must, while not forgetting his courteousness, be prepared to take steps to prevent the recurrence of the trouble.

It is not always easy to decide from the nature

of a complaint what the character of the defect is. It is usually the same thing to the subscriber. It is only when the defect is well defined that he gives any guide in his complaint. It should, however, be the aim of both office manager and inspector to forestall complaints as much as possible, and, to that end, the most complete harmony should be maintained between the two departments. It would, to me, were I a telephone superintendent, be a sufficient cause for removal of either the office manager or the inspector, as the necessities of the case might warrant, to another sphere of action, did I find any inharmonious relations existing between them. We will now imagine an every day case in a telephone exchange.

Excited subscriber comes in, saying "What's the matter? I have been ringing this hour, and can't get an answer."

That's the idea. The subscriber has given the cue in his first three words. "What's the matter?" All we have to do is to go ahead and find out, remove the trouble and report.

A small percentage of men will do these things in the proper order; a little larger percentage will do them, only putting the first last, and the remainder will omit the first item altogether.

"Well," I hear some one say, "it's easy enough to talk; but what would you do in the premises?" I would, first of all, if I were an inspector who had no previous electrical experience, find out just how certain troubles would affect the instruments; but in the present case it is evident that the first thing to do is to find out what the defect is.

1. Ask the office operator to ring up the complaining person and await results.

She may say, "He doesn't answer."

Very well; but if the office annunciator armature vibrated you have, at least, ascertained that the line is not broken. If, on the contrary, no result was apparent at the central office when the call was made, it is equally evident that the line is open somewhere. Or, in the third place, the call may have succeeded and the subscriber responded by telephone.

Take the first case. The subscriber doesn't answer, but the armature operated by the calling current vibrates. The signal may have been given at the subscriber's office, but no one was there to answer it; or an escape may be on the line between, or a ground or cross may be similarly located. We may safely conclude, in this case, seeing that our result corresponds with the subscriber's report, that the first idea may be neglected and we can proceed upon the hypothesis that a ground, cross or escape is somewhere on the circuit, either in the central office, on the line, or in the subscriber's office.

Going now to the subscriber's office, the inspector may take a look over the apparatus. He may perhaps find, as I once did in a hardware store, a crow-bar leaning against a line binding post and the steam heater. If he does, on removing it, he will probably find the trouble removed also.

More likely, however, he will see nothing amiss, and upon turning his crank, if the bell is a crank magneto, will find that it rings all right but that no response is made. Let him then disconnect the line wire as it enters the building. This done, if the bell will not ring, the trouble is outside. If, on the contrary, the bell does still ring the trouble is a ground and is on the subscriber's premises, and must be sought for there until found and removed.

A careful search will generally reveal it, but if it is difficult, the wire may be severed again, about half way between the former break and the instrument, and the ringing test once more applied. When the defect is found, the breaks must be carefully repaired.

If the trouble was ascertained to be outside and there is but one subscriber on a line the inspector can now return to the office and proceed to the cupola or other entering point. He may disconnect the offending wire there and ascertain if that opens the wire to the switch-board.

If the wires have been properly run inside they will probably be clear, but I have known copper joints made in a hurry and carelessly wrapped, come together behind a switch and ground lines. But we find that the drop armature no longer vibrates, and we have, therefore, ascertained the trouble to be on the line wire between the central office and the subscriber's office. The case may now be turned over to a lineman, who only has to go over the line. In

case more stations are on the line operations are, of course, much simplified, as it can be ascertained between which two stations the trouble is in the same way. No. 3 cannot get central office. You open at No. 2. and No. 3 can still ring his bell ground between No. 2 and 3.

Take, now, the second case. Complaint was: "Can't raise central office." Operator there tried to call subscriber, but tried in vain. The armature of the central office drop does not even move. All nature unites in telling you that the line is either open or has a very high resistance in it, such as a loose connection.

As in the previous case, the defect may be either at the central or sub-station or on the line. You are at the central office; there is only one station on the line, and that is half a mile away, so it is evident that in this case charity begins at home and you test the central office part of the line first. If you have a spare battery, say of four or five cells, it is a good plan to disconnect the end of the line from the ground plate and connect it with this spare battery, connecting the other pole of the battery to a ground wire. You will thus have a steady battery on your line and avoid troubling the operator. Supposing, however, that you have no such battery. Connect the wire just where it leaves the building to a ground wire and see whether, upon sending a call, the armature now vibrates. If it does, all right; the break is outside. This test can be performed without the assistance of the operator, by inserting a magneto bell between the office wire and the ground wire. It is a good plan to keep a bell in the cupola always for such work.

If, upon grounding, the bell does not work, the trouble is in the office, and can be found by inspection, aided by the application of the ground wire, as before. If the bell does work, the trouble is outside; and if but one station to the line, the inspector proceeds thither, and carefully examines every line connection, screw-post down to the ground wire. He may find a loose screw-post, a wire broken by carpenters, or a missing gas meter. If so, all there is to do is to fix it in good shape; and be sure either that the ground is made on the water pipe or that the meter is bridged by a stout wire.

If everything appears to be all right, he will ground close to where the wire enters, and try the bell, proceeding just as at the central office. If the bell rings, fault is outside; if it does not, trouble is inside, and must be found by continued inspection and grounding. If proved that the trouble is outside, and there is only one station on the line, report to lineman line open. If other stations are on the line, proceed as before, and when the break is thus localized between two stations, a temporary ground wire is put on, so that as many stations as possible may be grounded in.

Take next the third case. The call made by the central office operator was heard by the subscriber, and responded to by telephone. What now do the circumstances indicate? First, that the central office signals reach the subscriber, though those of the latter do not reach the central office; secondly, that telephonic conversation is practicable in both directions.

This, then, proves that the line is not broken nor heavily grounded or crossed, and also that the talking circuit is complete at the subscriber's office; and the cause of trouble is probably located either in the annunciator at the central office or in the calling apparatus of the subscriber. I say *probably*, because it is quite within the bounds of possibility that when the subscriber is now called upon to try and signal the office, he finds he can do it all right—the trouble was transient, and was produced by lineman drawing wires over or temporarily disarranging the wires.

The subscriber is requested to try to call the office, but no drop falls. The drop is examined and may be found to have a wire-edge on the detaining latch or some other little mechanical difficulty, which, when attended to, removes the fault. If the drop is found to be in good order, the subscriber's calling generator must be examined, and upon a careful examination will probably show at once the cause of the defect. The friction wheels perhaps slip; or the belt is broken or stretched; or a leading-out wire broken from the hinge of the box, or it may even be ascertained that the subscriber has thought fit to

take off the telephone and thus open the bell circuit before he commenced to call.

have been, perhaps, too prolix in explanation, but such a prolixity would have been a prize to me in the days of my early inspectorships; and it must not be thought, because it has taken so many words, that an equivalent time is occupied in the transaction of deeds to correspond. Every movement made for an accurate test frequently saves an hour of happy-go-lucky trouble hunting. Only one symptom has, thus far, been analyzed, and the subject will, therefore, be continued. T. D. L.

### The Illustrated Wordsworth.

One of the earliest of the nineteenth century English poets to be reprinted in America was William Wordsworth, whose fame was determined here before it was in his own country. \* \* \* The latest editor of Wordsworth is an American, Mr. Richard Henry Stoddard. Mr. Stoddard has some reputation as a poet, a circumstance which ought to make him a good editor of another poet. Whether it has done so the readers of his beautiful book must decide for themselves. \* \* \* Mr. Stoddard's estimate of the poetry of Wordsworth is high, but not, we think, too high. "It belongs to Nature in the largest sense, to what is unchanging in man, and what is permanent in the Universe. It is simple and strong, it is lofty and dignified, and it is gloriously imaginative. No poets ever surpassed him in the creation of felicitous epithets, 'words which are things,' and no poets ever raised the soul to serenest heights of meditation. He is as much above mortality and time as if he were a pure Intelligence." Poems of William Wordsworth is a handsome octavo of 320 pages. It contains eighty-four of his most poetical poems, long and short, the fruits of his opulent young manhood and his wise old age, and is illustrated with seventy-five characteristic designs from the pencils of Sir John Gilbert and Birket Foster, who have gone like docile scholars to the great Master of Nature, William Wordsworth. (W. J. Johnston.)—*N. Y. Evening Mail*.

### The Omaha Telegraphers' Ball.

The second annual ball of the Omaha telegraphers, Nov. 28, was, as it deserved to be, a brilliant success. Among the elaborate decorations of the hall was a tablet inscribed to the memory of the various dead and gone telegraph companies which have been from time to time absorbed by the Western Union. It ran thus:

United States—Mysteriously disappeared.  
Illinois & Mississippi—Excessive opposition.  
Great Western—Starved to death.  
Atlantic & Pacific—Killed in Wall street.  
Pacific & Atlantic—Consolidation fever.  
American Union—Cerebro spinal Jay Gouldus.  
*Requiescat in pace.*

The ball-room was connected with the outside world both by telegraph and telephone. Telegrams of regret were received from Cheyenne, Chicago, New York, St. Louis, New Orleans and other points and one signed by the operators of the overland circuit, Chicago to San Francisco. The various committees were as follows:

Executive Committee—J. J. Dickey, chairman; L. M. Rheem, treasurer; Thomas Curry, secretary; C. J. Smallwood and Geo. W. Shaw.

Reception Committee—J. G. Boyd, Geo. Gardiner, J. B. Pritchard, E. A. Brandenburg, C. M. Woodman, L. H. Korty, chairman; F. M. Crittenden, C. R. Tyler, J. H. McGuire, W. A. McElroy, G. M. Gould, L. H. Fisher, W. J. Rushland, W. F. Sedgwick, J. P. Ellis.

Ladies' Reception Committee—Mrs. L. H. Korty, Mrs. L. M. Rheem, Mrs. Perry Chamberlain, Mrs. George W. Arbuthnot, Mrs. F. M. Crittenden, Mrs. C. B. Horton, Mrs. T. Curry, Mrs. F. B. Williams, Mrs. J. B. Pritchard, Mrs. C. W. Moore, Mrs. E. L. Armstrong, Mrs. G. W. Dickinson.

Floor Committee—C. K. Cralle, floor manager. Assistants—E. L. Armstrong, F. B. Williams, P. Chamberlain, R. C. Hayes, John G. Morse, C. B. Horton, C. W. Moore, C. E. Mayne, G. W. Arbuthnot, T. M. Orr, Geo. M. O'Brien, Jr., G. W. Dickinson, W. H. Hayes, E. H. Allen, C. C. Mayne.

Among those present from a distance were:

Alex. Washington, chief operator, Mr. McGowan, Miss Katie Johnson, Miss Annie Wilson and Miss Eib, St. Joseph, Mo.; Mr. C. F. Annette, chief operator U. P., Cheyenne; M. M. Runyon, agent and operator, Clear Creek, Neb.; B. S. Josselyn, U. P. manager, Grand Island; H. C. Hope, superintendent telegraph, Omaha & St. Paul line; Miss Dohaney, Council Bluffs; D. J. Brann, R. C. McDonald and Aleck A. Stevenson, Chicago.

### Storing Electricity.

Prof. Sylvanus Thompson, of Bristol, lectured on the above subject last night at the Society of Arts. Prof. Adams presided, and the room, which was crowded, was lighted during the lecture by two groups of suspended Edison lamps connected with 40 Faure cells brought to the building ready charged. Prof. Thompson, after explaining the scientific principles upon which the storage of electric energy was based and the various accumulators which had been invented, gave some anticipations of the possible use of the discovery. First, in regard to lighting, secondary batteries would serve for portable supplies of electricity, for accumulated supplies, and for equalizers of electric currents. The value of accumulation was evident in the case of a theatre which might, by accident, be plunged in darkness if dependent on external sources. A possible application was the firing of torpedoes and blasts in mines. Another was the perfection of the telephone in increasing the power of the transmitter by employing a multiple microphone. A hundred microphones united would produce loud and distinct speech. By far the most important of all the possibilities opened out by the storage battery was the utilization of wind and water power. Differing from Sir W. Thompson in his address to the British Association, he believed there were cases where no great expense would be incurred in utilizing tidal areas as basins. The Avon at Bristol required but a few yards of embankment to be turned into such an area. A tenth part of the tidal energy in the gorge of the Avon would light Bristol. A tenth part of the tidal energy in the channel of the Severn would light every city and turn every loom, spindle and axle in Great Britain. Electrical railways and electrical tramways, Prof. Thompson said, were now existing facts, and "many months will not elapse—or it will be an eternal disgrace to the first city in the world—before the fetid and poisonous atmosphere of the Metropolitan Railway is replaced by a pleasant and salubrious air, rich in fragrant ozone; and the like revolution will not be long delayed in many quarters where reform is far less imperative. In all these changes the accumulator will have its part to play." In reply to a question Prof. Thompson expressed the opinion that the cost of the electric lights in the room was less than the cost of gas would be for a mansion which had to provide its own apparatus for the making of gas.—*Pall Mall Gazette*.

### Compliments for the New Book.

From among the many flattering opinions of the new book, "Wordsworth's Poems," received since its publication, we publish the following, as samples of the others. The names are not given, as the views were probably not intended to be made public.

"It is a most creditable output, and eloquent evidence of your good taste and energy."

"The clear and perfect type are just suited to a work of that kind, and the engravings are beautiful."

"I most heartily congratulate the publisher on the good taste displayed in the design and general get up, and hope the venture will meet with the abundant success it deserves."

"I did at one time think it was a mistaken idea on your part to publish such a book, but after seeing it I am fain to change my mind. If every one of your subscribers could see it, they would certainly buy it."

"It is indeed a 'magnificent work,' and I prize it highly. Every one who has seen the book has

praised it, and I hope it will have a very large sale. I think you have put a little better work on this book than on any of your publications, although any publisher might well feel proud of having put out *any* of your books. The paper in this is of superior quality, showing off the fine cuts and beautiful print to the best advantage, while the binding is strong and durable. Altogether, it would be difficult to find a more perfect book in all that goes to make a desirable volume."

#### Notes and Queries on Electricity and Electro-Magnetism and Their Applications.

BY T. D. LOCKWOOD.

Practical as far as possible;  
Theoretical as far as necessary.

170. How should an aerial line be led into a terminal office?

A. Where many lines—either pole or house-top—are run, a cupola is frequently used, into which the wires are led, as indicated above.

Sometimes also they are terminated at a pole, by winding them back on themselves after being bound to the insulator. A plan often adopted in our cities is to range a cross-bar outside the window where the wires are to enter, and screw a sufficient number of hook insulators into it, on which the wires coming down from the fixture or pole are terminated by winding back.

Q. 171. What wire may be used in fitting up an office, and how should it be attached to the walls or ceilings?

A. It is the practice with telegraph employes in general to use about No. 14 covered copper wire, and to sling the wire loosely in and along the ceiling, in any loose way so as to get them in; but it is as easy (and much more satisfactory when done) to do a job of wire-running tastefully as slovenly; and it is a positive science to run the inside wires of a telegraph or telephone office in a manner both useful and ornamental.

To do this, it has been found in practice that it is better to use braided copper wire, of a gauge not larger than No. 18, and of that size, all things being equal, none is so good as that manufactured by E. F. Phillips, of Providence, R. I. To have this wire colored, often gives a very good effect, especially when colored red. But, in any case, No. 18 is sufficiently large to fill every practical purpose, while it is much easier to handle and gives a better general effect when strung.

The wires when chosen should, if numerous, be strung through cleats of black walnut, pierced with the required number of holes, which should only be large enough to let the wire pass through easily. If more than fifty wires are to be put up, it will often be found necessary to bore more than one row of holes and run the wire two or more tiers deep. Each cleat should be screwed to a base-board of hard wood, which is to be screwed to the ceiling. This is to give a greater purchase to resist the strain of the wires when pulled tight. The wires should be secured with a half hitch to the first cleat, and when pressed through all of them, tightened up, so as to take out *all* the slack, and anchored by another half hitch at the last cleat, which should be about two feet above the switch-board, if one is used.

Instead of then bringing them straight down to the switch, it is better to make them into loose spirals, as it adds to the general effect and also gives slack if any wire should break.

If only two wires are to be arranged, it is sometimes convenient to string them on opposite sides of a row of porcelain knobs, till they reach the instruments.

Where extremely powerful currents are used, as, for example, those employed by the Gold and Stock Telegraph Company, the office wires need a much more effectual insulation than paraffined cotton, and kerite or rubber covered is generally employed. In large Western Union offices, the wires are secreted as much as possible.

Close to the entering point of a building should

always be a lightning arrester, which should be connected to a very reliable ground wire. Every wire entering the office ought to pass through the lightning arrester. The lightning arrester ground should never run to a lead pipe or to the same ground that other wires are led to.

A favorite method which has lately obtained in telephonic circles, and which is excellent, is to run the wires clear down to the switch-board in twenty-five or fifty-wire cables. This gives a very clean and neat appearance to the office. It is a very good plan also to keep the wires out of sight altogether, which may be done by ranging them in troughs along the floor and bringing every wire to the switch-board at its rear.

Q. 172. What is the best arrangement of instruments in a telegraph office, operated on the ordinary Morse system?

A. In an ordinary way-office the apparatus consists of the following instruments: a relay, and key in the main line circuit, a sounder or register and local battery in the local circuit, and a switch and lightning arrester; the latter is often combined with the former.

The switch, or if there is none, the cut-out, is placed on the wall and the office wires led to it. If it is a Western Union pin switch, the leading-in wires are led to the binding posts connected to the upright metallic bars, where they remain open until the pins are inserted. Two other wires, called the instrument wires, are led from the side binding screws, under the table, and after the relay, sounder or register and key are placed in position, holes are bored through the table near to the main line binding posts of the relay (these are usually placed at the right hand end of the relay), the key is then fixed, boring holes through the table for its legs, and the wire connected. The order of the instruments is indifferent; that is, it does not matter which comes first or last. One of the main wires is led to one leg of the key, and there fastened to it. A short wire is run from the other leg of the key to one of the relay binding posts. The other main wire is then connected to the remaining relay binding screw, and the main circuit is complete, the order being as follows: Line wire, key, relay, line wire. The plugs are now inserted in the switch. The local circuit includes the local battery, the relay points and the sounder, or register, and is run as follows: After setting up the local battery, which is usually two cells, run a wire from one pole, say the copper, to one of the binding screws of the sounder, which, like the relay, has holes bored near it; then another wire from the other sounder screw to one of the local screws of the relay (these are usually at the left-hand end of the instrument), and a third wire from the other relay local screw to the other pole of the battery. It is perhaps almost unnecessary to say that these office connections must always be made with covered wire, and particular care should be taken to keep all screws tight.

The sounder, or register, is most conveniently placed near the centre of the table, and if a register is used, the paper reels should be fixed one at each end—one to deliver the paper to the register and the other to receive the paper as it comes from the register; the relay is preferably placed at the left of the register, and in the rear, while the key is placed at the right, also at the rear of the table, so that an operator, when sending, has the table whereon to rest his arm. A terminal station is arranged on the same principle, but as only one wire comes in for each line, the other end goes to the main battery and ground. For example, the wire entering the office is led to the switch-board, thence to the relay, thence to the key, after which it is carried to the battery, and the other pole of the battery is connected to the ground.

#### Pacific Coast Notes.

To the Editor of The Operator:

SIR: I have two papers before me, and, seeing both together, cannot refrain from comparison, contrast and retrospect. One is the *Electric*, published by Hayes & Noxon, St. Louis, as the prospectus informs us, and has the comparatively venerable date of 1875. The other is THE OPERATOR of Nov. 1, 1881. The *Electric*, judging by the specimen before me, was a spicy, wide-awake, gossipy sheet, and seems to have been deserving of more than an ephemeral ex-

istence. But "whom the gods love die young," and this is only one of the many publications of the kind that have twinkled for a brief season in the telegraphic firmament and suddenly disappeared from the gaze of mortals.

By the way, "Jeff" Hayes has recently been in the wilds of Arizona, as Western Union operator at Wilcox, the military headquarters during the late Indian scare. After exhausting the attractions of that portion of the frontier, he returned to civilization and the "S. F." office for a short time. It is rumored that telegraphy is merely a "side speculation" with the genial "Jeff," and that he only drops back into the ranks occasionally to keep the rust off and break the monotony of elegant independence.

Turning from the *Electric* of six years ago to THE OPERATOR of to-day, we see as corpulent and self-satisfied a looking paper as an ambitious editor would desire at its still comparatively tender age. The lusty growth and solid success of THE OPERATOR should be, as it is, a source of gratification to every telegraph operator in the country.

The story told in the "Review of the past two weeks," giving the details of the bribery of a Mutual Union contractor's employé by officials of the Western Union, naturally causes a sensation of surprise—not at the apparent fact that officials of the latter company would countenance such a "fishy" transaction, but that any of them would be stupid enough to trust that they could do anything of the kind and not be found out. We have not heard of any reason for doubting that Western Union officials have hired men to chop down the poles erected by an opposition company; and why should the public be surprised at further evidence of total depravity from the same source? That Messrs. Bates and Eckert may be proven innocent in this matter is "a consummation devoutly to be wished," for they have both acquired (and probably deserve) a reputation for manliness in their dealings with employes and the public. It is quite possible that at this distance from the seat of government we are not well posted in all respects, but an impression does prevail here that the Western Union Telegraph Company is practically owned by one man. And if a corporation is owned (or *controlled*, if it sounds better) by one individual, is it possible for any one upon whom he confers a "little brief authority" to be a free agent? This idea is too painfully suggestive, and has a tendency to shake our faith in the integrity of human nature. We will only pursue it far enough to say that many hopeful anticipations of reform, based upon the belief that a certain individual would be as liberal and whole-souled in an official capacity, recently attained, as he was thought to be when an obscure private in the ranks, have been rudely dissipated by the acts of the same individual when he began to feel his puny power. "Oney timers" were sanguine that when General Eckert returned to the Western Union and assumed nominal control, a more liberal policy and better times for employes would be ushered in. And now some of these "old timers," as they hang on to the old positions they have filled faithfully for years, with salaries reduced and new men put over them in more lucrative positions, in solemn, lugubrious chorus sing:

"Ah! ever thus! From childhood's hour  
I've seen my brightest hopes decay,  
The new official feels his power  
And there's the very deuce to pay!  
The dividends must be declared,  
Officials must recognize,  
No doubtful measures will be spared;  
It's not a time to moralize."

We still are hopeful of the Mutual Union, but not too sanguine; we only know that a genuine opposition company will be the cause of an increase of business, and that means an increased demand for operators. Indeed, the demand for good men at present is very encouraging to the fraternity. Speaking of the Mutual Union, we notice that Mr. James Gamble, ex-Western Union superintendent of the Pacific Division, has been appointed superintendent of the new company. Mr. Gamble is a telegrapher of great experience and ability, but by no means popular among operators upon this coast, and not noted for his liberality toward them generally. His resignation did not cause poignant sorrow among the members of the craft here, who were glad to see

the position filled by the gentleman who now holds it.

The telegraphic business of this coast has increased wonderfully within the past two years. The facilities for handling it have not been increased proportionately, and in consequence of the limited number of wires messages are delayed very seriously. A new overland route has been opened through, via Los Angeles, Deming, Pueblo and Kansas City, but as there is but one wire over a great portion of that route it cannot be depended upon for the transmission of a very large proportion of the business between the Pacific and Atlantic coasts. Los Angeles and the offices above mentioned have been supplied with duplex repeaters.

Messrs. Meredith, Swift, Ingram, Cummings and Scholl are the operators at Deming, New Mexico; Mr. Meredith, manager. This is now an important repeating office, the junction of the S. P. with the A., T. & S. F. Railroad. Messrs. McCoy, Dennis and Ward Lane have resigned their positions in the San Francisco Western Union office to accept employment with the same company in Chicago. Mr. Riehle has also left the San Francisco office, and is now stationed at Los Angeles. The San Francisco office is becoming quite unpopular among the fraternity, and we have not lately heard any outsider express a frantic desire to obtain a position in it. The work is hard, its sanitary conditions are not above average, and the bulletin board isn't big enough. At the same time, there is probably no office throughout the country employing as large a force that can boast of an equal number of intelligent, capable and reliable operators.

The carnival of errors still continues. There are some ingenious cheap operators distributed among the repeating offices between New York and San Francisco, who throw a little variety into an otherwise monotonous existence by strange transformations and curious freaks of temporary mental aberration—in brief, by making "bulls." Rumor says these artists are found in greatest number at Omaha and Kansas City.

It may be possible for a message to run the gauntlet of those offices without mutilation, but I wouldn't risk my reputation upon the chance of a single telegram being transmitted between San Francisco and New York without an error. There was a rumor current some time ago to the effect that such a message had been seen, but it was discovered to be without foundation, having been circulated by unscrupulous parties who were interested in "bulling" Western Union stock.

There are just two causes that could produce such a disgraceful condition of the telegraphic service. The first is the employment of the talent(?) and the second is the increase of the duplex and the proportionate multiplication of the man who "never breaks."

We are pained to hear of the death of George H. Bowker, who died at Tucson, Arizona, Nov. 20. He was one of the most expert operators we ever knew, a wide-awake, energetic man, and a genial, good-hearted fellow. May he find a happy dwelling place in the undiscovered country into which mysterious realm he entered before he had reached the prime of mortal manhood.

Nov. 22, 1881.

PACIFICUS.

#### St. Paul (Minn.) Items.

To the Editor of The Operator:

SIR: The Mutual Union opened here Dec. 1. At present they have four wires, two direct to Chicago, one to Stillwater and a pony to Minneapolis. The expectations are that early in the spring they will have a direct wire to Winnipeg and two more to Chicago.

Mr. C. E. Hughes, for many years chief operator in the late N. W. Tel. Co., is manager, and his large experience and well-known ability will render him, without doubt, a popular and successful official.

The force to-day consists of W. L. Cullen, day, and Charles Corser night operator; Henry Minar, counter and check clerk; Dave Naughton and Frank Cavanaugh (no relation to the old man) messengers.

For the first three days after opening C. N. Ds. were distributed to the principal commission men, and so much satisfaction did the work give that seven out of nine regular cus-

tomers of the W. U. forsook their old love(?) and came to the Mutual and asked to be supplied on W. U. terms. Of course they were accommodated. We understand that Supt. McMichael came all the way from Minneapolis and made a personal effort to win them back to his company, without success. General commercial business is increasing every day and comes quite up to what was expected. The wires have been carefully strung and work admirably, and there is every reason to believe that the magnificent poles the company has been enterprising enough to make use of will prevent many of those provoking breaks so common on the opposition lines.

The office is nicely fitted up with all modern improvements, including a handsome walnut quartette table with four sets of nickel-plated instruments.

The general public, realizing the danger of such monopoly as the W. U. has striven to make itself, and disgusted with the poor service lately rendered, have extended a cordial welcome to the new company.

Since the consolidation, numerous changes have taken place in the ranks of the W. U. Very few of the old familiar faces are now to be seen, most of them having resigned to accept more lucrative positions elsewhere. Manager Jilson, of the W. U., has been appointed superintendent of telephone. Clark Davidson, late chief W. U., has been appointed chief operator C., St. P., M. & O. R. R. Billy Moore and Dad Anderson have accepted positions with the M. U. in Milwaukee. H. E. Thompson, of the W. U., has gone into the electric supply business in this city.

Alf Chantler still takes press reports for the *Pioneer* in a very satisfactory manner.

The following comprise the present force in the W. U.: Mr. E. Curry, Manager; D. L. Wilson, Chief Operator; C. B. Coningham, Assistant Chief Operator; W. D. Gregory, Night Manager; operators, Mr. Stewart, Harry Collins, C. H. Lord, W. R. Jones, Mrs. C. H. Lord, Miss Tyrrell, L. A. Hughes, Miss Eccles, Mr. Moreland, Lew Wise, Jas. Purtell, Percy Percell, Mr. Farar, W. C. Hendey, cashier.

In the Dispatcher's office of the C., St. P., M. & O. R. R. we find Mr. J. L. Ritter chief train dispatcher, ably assisted by Messrs. Crookshank, Gillis and Fordyce. Mr. H. C. Hope is the popular Superintendent of Telegraph on this road. J. F. Hine, an old army telegrapher, is acting private secretary to J. F. Lincoln, Superintendent of the road.

The Brotherhood of Telegraphers are in a flourishing condition here, numerically and financially. A club room has been nicely furnished for holding meetings, social gatherings and reading rooms. The first annual ball and reception under its auspices will be held Dec. 20, and promises to be a very enjoyable affair. Invitations can be had on application to Messrs. Minor, Thompson or Chantler.

Frank Minor recently paid us a visit from Fort Snelling. His many friends in Chicago and Omaha will be glad, no doubt, to hear that he is a perfect picture of health under this invigorating climate.

#### Diamond Cut Diamond.

The Western Union monopoly have shrewd men in their employ, but not shrewd enough to combat the cunning of some other smart people that the exigencies of the hour are fast developing. The new American Rapid Telegraph Company planted one of their immense poles on Friday, on Third street, in front of their proposed office, not half-a-dozen doors from the office of the old company, and within two feet of one of the poles of said company. The pole was a tall one, and from its topmost point seemed to look down with contempt upon its shorter neighbor. The cross pieces were bolted on it preparatory to the hanging of [the wires of the company on Saturday. But Friday night the Western Union boys had their pole spliced and raised their wires so that the American Rapid Company would not be able to place their wires on Saturday. The joke turned and the laugh rebounded when, without the slightest trouble, the latter company hung their wires and completed their labor, and "all in spite of my Lord Cardinal."—Harrisburg (Pa.) Patriot, Dec. 12.

#### Making War on the Brotherhood—A Manly Letter.

To the Editor of The Operator:

SIR: "For ways that are dark and tricks that are vain," some managers of telegraph offices are peculiar. Why they should be any less honest or straightforward than others, I know not, but that they do often resort to tricks mean and dishonorable I know. Perhaps the cause is at the fountain head, and they feel compelled to lie and scheme in the dark in order to please the "mighty potentates" (?) over there, or, perhaps it is a desire to emulate their superiors that animates them, and the wish to be considered as shrewd in scheming. But whatever the nature of the cause, the result is the same; the poor creature is no sooner placed in power than he is seized by the "big head;" his manliness and integrity (if he ever had any) are forgotten or made to occupy a secondary position to his concealed ambition.

An example of this recently occurred in the Chicago office of the Western Union Telegraph Company. Three months ago I was numbered among the staff of that office, and had been for over four years. For urgent reason of a domestic nature I desired to remove to St. Paul and applied to the St. Paul office for a position, at the same time informing Manager Maynard of Chicago, and asking his support for the application. In about three days I received from St. Paul an offer of a position and accepted it.

A few days later the chief operator there sent me word as follows: "Withdraw your resignation. No vacancy. Will give you the first opening." This surprised me, for I knew they were in want of men. I waited patiently for several weeks, and during that time no less than six vacancies were filled, but there was no place for me.

Again I went to Manager Maynard and asked his permission to exchange places with a St. Paul man who wanted to get to Chicago. He replied that he had no objections, providing I could arrange it satisfactorily with the St. Paul officials. I tried the exchanging process, but without success. They were still needing men in St. Paul, but, for reasons I could not understand, they would not accept my services. Finally I was tendered a position on the St. P., M. & O. road. This I accepted and left Chicago as soon as possible.

Since coming here I have learned the true inwardness of the case, which pictures Manager Maynard in a very unpleasant light. It seems that as soon as I told him I had applied to St. Paul, he wrote to Supt. McMichael, at Minneapolis, informing him that I was a member of the Brotherhood of Telegraphers, a correspondent of THE OPERATOR, an organizer and an agitator. Upon learning this, the Superintendent instructed the Manager in St. Paul not to hire me.

After rendering Mr. Maynard over four years of faithful service I am puzzled to conjecture why he should have gone out of his way unkindly and unjustly to besmear my character to such an extent that I stood before the St. Paul officials as unfit for employment. Had I been of drunken or dissipated habits, I could have understood it, but as I was always at my post and careful in my work, not an agitator nor an organizer, I failed to detect his reason. If to send an occasional item of news to THE OPERATOR is to unfit men for honorable employment, it is time all operators understood it so; or if to belong to a benevolent organization, simply because it is composed of telegraphers, is a disgrace, it is time they understood that also. I am a member of the B. of T., and am rather proud of it than ashamed. If ever trouble is brought about in connection with the Brotherhood, it will be through the instrumentality of meddling managers. I have asked Mr. Maynard to withdraw the false charges against me; but as he has so far declined to take any notice of my request, I do not see any other way to right myself, and warn my fellow workers of the dangers they are in through Mr. Maynard's duplicity, than by placing the matter in the columns of THE OPERATOR. My good name is very dear to me, and I want Mr. Maynard and others to understand that they cannot tell lies about me without standing the consequence.

W. L. CULLEN.

ST. PAUL, Nov. 21, 1881.

PUBLISHED SEMI-MONTHLY

At No. 9 Murray Street, New York.

Entered at the N. Y. Post-office as second-class matter.

W. J. JOHNSTON, Editor and Publisher.

NEW YORK, DECEMBER 15, 1881.

Americans visiting Europe will find THE OPERATOR on file at the AMERICAN EXCHANGE AND READING ROOM, No. 449 Strand, London.

Subscribers desiring their addresses changed, should give the old as well as the new address.

## NOTICE.

Those whose subscriptions expire with the present or with next issue, will confer a great favor by FORWARDING THEIR RENEWALS PROMPTLY. By so doing they will save us trouble and themselves the possible annoyance of missing any of the numbers. TRY IF YOU CANNOT get two or three other SUBSCRIPTIONS TO SEND WITH YOUR OWN. An order for some of the books we publish would also be acceptable.

## STUDENTS.

In this issue of THE OPERATOR we surrender considerable space to the gratuitous advertising of that great bane of the American telegraph—the “College.” It is a subject which, more than any other one thing, concerns the salaries and the general welfare of the profession; and it is one, moreover, to which every true operator who desires to see his chosen occupation elevated to its proper standard should pay the strictest attention.

It is a subject which also concerns the general public, as well as the municipal law officers in various parts of the country, since your average “Professor” in this branch of business is usually an unprincipled swindler, who should be avoided by the former, and taken in hand and disciplined by the latter. We have endeavored in this issue to show up some of their methods of advertising, although the want of sufficient space makes the showing necessarily brief. There is enough, however, in the astonishing advertisement of the “Union Electric Telegraph Instruction Company of California”—which gravely prints a list of offices on “our practice circuit,” including the cities of San Francisco, Cheyenne, Chicago, Philadelphia, New York and Boston—to set upon it the stamp of a heartless fraud. This same concern also advertises in the local papers one day for “four young men, to learn telegraphy,” and the next day for “four young ladies,” to be similarly fleeced. Any one with half an eye may observe how cunningly these advertisements are worded, leading poor young men and still poorer girls to believe that they have already procured situations for the last batch of learners, and will just take four more to do likewise with them, as though there were four vacant positions to fill. It is needless to say that, by this means, many persons, who in time of prosperity laid a few dollars aside for a rainy day, are easily “relieved”

of their scant resources by an unconscionable “company,” which talks vaguely of its “influence” with superintendents and leads the innocents to believe that they can supply them with positions “when qualified.” These men are shrewd enough to leave a loop-hole to crawl through when the exasperated learner, made desperate by failure to get work, comes back to them with his or her complaint, maybe charging them with swindling. In such cases the answer comes with surprising promptness, made perfect by practice, that the only trouble is that the learner needs more practice; in other words, the “Professor” tells them that they are not yet “qualified,” and blandly suggests private lessons (at a moderate charge, of course), as a means of overcoming any difficulties in the way of securing some good position.

What do our readers think of the assertion that “If all their work could be done at once, the operators could finish what they generally have to do each day in two hours; but as it comes scattered through the whole day, they hardly realize that they have done any work. It is almost like being paid for sitting in a pleasant office and studying or reading”?

Then, we have “salaries paid, \$80, \$90, \$100 and \$115 per month for large offices,” all of which is a base fraud upon the public and damaging to us.

That kind of advertising is, taken all in all, rather amusing to those toilers who, from sad experience, know better; but there is a serious side to the question which it behooves us to watch closely.

A NEW division of the signal service has been established by Gen. Hazen, chief signal officer, with a view of extending the service so as to include the observation of the weather at sea, and captains of vessels are to be asked to co-operate in this service. What is wanted particularly by Gen. Hazen is an observation to be made daily, whether in harbor or on the ocean, consisting of the latitude and longitude, height of the barometer, temperature, direction and force of wind and general character of the weather. The reports, upon the arrival of the vessel in port, are to be forwarded to Washington, in envelopes provided by the department. These reports are converted, tabulated and published in the international bulletin, a copy of which will be furnished to each observer. The object of these observations and reports is to ascertain definitely the tracks of storms around the globe, and to determine the meteorological conditions in each ocean square at the time when, on land, the simultaneous observations—12:08 P. M. Greenwich time, or 7:23 A. M. Boston time—are taken. It is hoped, and, indeed, confidently expected, that the department will be enabled, after proper observations, to follow the course of storms around the world, whereas, under the present system, the track of the storm is lost sight of at the sea coast. It will be seen that the aim of the service is an important one, and, when the system shall have been systematized, it will be of almost incalculable benefit.

THE quarterly report of the Western Union Telegraph Company was submitted by President Norvin Green to the directors of the company yesterday, Dec. 14. A quarterly dividend of 1½ per cent. was declared, payable Jan. 16, 1882. The stock-books of the company will close at 3 P. M. on Dec. 20, and remain closed till Jan. 17. The official returns of the company’s business for the quarter ending Sept. 30

last amounted to \$2,104,635.75, an excess of \$154,741.14 over the estimate presented at the quarterly meeting held Sept. 14. A surplus of \$629,759.91 existed Oct. 1. The net revenues for the quarter ending with the close of the present month, based upon official returns for October, nearly complete returns for November, and an estimate of the business for December, are placed at \$2,010,527.27, which, added to the surplus of Oct. 1, will make a total of \$2,640,287.18. To be deducted from this amount is interest on the company’s bonded debt, \$107,000; for construction and purchase of telegraph stocks and properties, \$300,000; sinking funds, \$20,000—a total of \$427,000, leaving a balance of \$2,213,287.18. The payment of the 1½ per cent. quarterly dividend on capital stock will require \$1,200,000, which, being deducted, will leave a surplus of \$1,013,287.18.

WE have to-day shown to the executive officers of the Western Union Telegraph Company how some of their local managers are appropriating the company’s material and time for the purpose of sustaining so-called Telegraph Colleges, as a means of profit to themselves. For the guidance of all parties, we reprint below W. U. Executive Order 171, which appears to have become obsolete, and respectfully ask if it is still in force:

EXECUTIVE OFFICE,  
WESTERN UNION TELEGRAPH COMPANY,  
NEW YORK, Oct. 30, 1877.

## Executive Order No. 171.

Under a misapprehension, doubtless, of their obligations to the company, some of its employes have, without proper authorization, engaged in enterprises outside of their legitimate duties, which have, to a greater or less extent, been in conflict with the interests of the company or of other companies associated with it; such, for example, as the construction of private telegraph lines, the introduction of telephones, or as agents for fire and police telegraphs, insurance companies, et cetera.

No employé of the company should engage in any other business or accept any other employment without previously receiving the written consent of his respective District and General Superintendents.

This order does not prevent employes of this company from acting as agents for the Gold and Stock and American District Telegraph companies, and of the various railroad companies worked in connection with the Western Union.

WILLIAM ORTON, President.

The “et cetera” covers the keeping of telegraph colleges at the company’s expense.

IN speaking of the rupture of the new American cable, our esteemed London contemporary, the *Telegraphic Journal*, seems to believe, like Mr. D. H. Bates, that there is something “strange” in it. It pithily says: “As a large holder of Anglo-American stock, Mr. Jay Gould may possibly not look upon the accident in the light of a great disaster.” Our esteemed contemporary might even go back a couple of years, and note the striking comparison between the “strange” management of this cable and of the last one in which Mr. Jay Gould was interested. On the 18th of November, 1879, the steamship Faraday appeared off North Eastham, Mass., and, picking up the shore end of a cable, completed the alleged communication with Brest of the French Telegraph Company of Paris and New York. The older companies at once came down in their rates to 12½ cents per word, whereupon something “strange” happened to the New French cable, and for months they were unable to work it. In this case of the American cable, the older companies reduced their rates Aug. 1 to 25c. per

word, since which time it has not been "worked"—that is, outside of Wall street.

THE Electrical Exhibition at Paris closed on the night of Sunday, Nov. 20, having produced a net profit of \$80,000. During the last day and evening, admission being free, there was a vast multitude in attendance, the main hall and galleries being crowded with visitors of the artisan class. Shortly before 11 o'clock every steam whistle and electric bell was set going, and in the midst of the distracting din the building was cleared and the exhibition came to an end. The exhibits will now be taken to the Crystal Palace, London, where the spacious terrace and ample space in the interior will afford every facility for a thorough exhibition of the electric light. The entire exhibition, however, will be less comprehensive than the one just closed at Paris. We look forward to the day when New York shall honor herself and American telegraphs by a similarly prosperous exhibition of electrical appliances.

THE letter of our esteemed correspondent, Mr. W. L. Cullen, is a manly utterance, which should have a beneficial effect on those managers—there are many of them—who continually lie to and otherwise deceive their subordinates. We deprecate anonymous attacks, but when a man comes out over his own signature and says, "I want Manager Maynard and others to understand that they cannot tell lies about me without also standing the consequences," he is kind of talking business like. Our fraternal organization will in time do much toward the crushing of sniffing "managers," who by double-dealing and official obliquity ruin the *morale* of the company's splendid force of operators; but, for the present time—with Gen. Eckert and Mr. Bates so eager to discover and correct frauds and shams of all kinds—one blast from a bugle-horn like that blown by Mr. Cullen were worth a thousand men.

THERE is no reason why the managers of our system of electric lighting should not give us the true candle-power of their lights, without the misleading exaggeration involved in the use of "the French measurement." This term means that the candle-power is measured at the four points of the compass, and the results are then added together, thus giving the candle-power four times its true value for purposes of comparison. If it must be used at all, this French measurement might as well be extended to each of the 360 degrees forming a circle around a given centre, and by thus adding the results together a comparatively small light could be given any degree of candle-power. A better way, though, is to go back to first principles, and give us only the true candle-power of an electric light.

THE secret efforts of a Western manager practically to black-list an operator, under guise of friendship, for his connection with the Brotherhood, may possibly be the beginning of a war upon that organization. If that be the case, we advise the executive officers to see that their local managers go slow on this point. No level-headed chief in any concern ever yet precipitated a crisis; it is your blundering, pettifogging, enthusiastic sub-chief who fires the train, and he ought to be officially gagged in time. Mr. W. L. Cullen is a reliable operator and a most estimable gentleman, and his sturdy letter will appeal to the finer feelings of every true man and

of every one who despises double dealing and deceit, although we presume it will arouse emotions of an opposite character in the breast of Manager Maynard.

THE electric light has now to bear suspicion of responsibility for the Vienna theatre disaster, in which a thousand lives were lost. Gas was used in this theatre, but it was lighted by an electrical contrivance, so that the fire must rather be blamed upon the gas. Still, the fire at Landenberger's mill, in Philadelphia, recently, by which a dozen lives were sacrificed, was directly traced to the electric light, and the frequent reports of accidents from the same cause should direct attention to the extreme peril to life and property involved in the use of the deadly current.

The subject of the thorough insulation of electric light wires is of the greatest importance, and should be thoroughly investigated by our scientists.

SINCE our last issue the Pennsylvania Railroad has had four accidents, on its division between this city and Philadelphia, inside of 24 consecutive hours. It is not quite six months since, on the occasion of their torturing to death two ill-starred human beings by an "accident," at Bear Swamp, a coroner's jury very properly censured the management for its parsimonious methods. Since then they came near killing their own General Manager, Frank Thompson, and actually battered his car into kindling wood. The Pennsylvania Railroad is alleged to run by telegraph, and it pays the bulk of its operators less salary than any other large corporation in Christendom.

THE recommendation of President Arthur, in his annual message, that Congress provide for the repayment of the personal expenses of our honorary commissioners and delegates to the Paris Electrical Exhibition should be acted upon at an early day. The gentlemen gave their valuable time and experience at the instance of the State Department, and without prospect of other reward than the proud consciousness of a great work grandly done; and, since the results have been so eminently creditable to America, we should not object to paying the expenses of those who worked so assiduously to that end.

THE law demands that two Signal Service Sergeants shall be promoted to be Second Lieutenants every year, yet none have been so advanced for two years. A reference to the *Army Register* for 1881, gives the following list of Second Lieutenants in the Signal Corps: James A. Swift, appointed Nov. 1, 1878; Leroy E. Sebree, Nov. 4, 1878; Joseph S. Powell, Nov. 13, 1879; William A. Glassford, Nov. 14, 1879. The promotions seem to have been neglected in 1880 and 1881, and the fault, we believe, is with General W. T. Sherman.

If the opposition telegraph companies are becoming discouraged, let them remember that it was testified, in the telegraph suits last May, that the Western Union Telegraph Company knowingly paid for the American Union more than twice its face value, the Directors of the older company being more than willing to forget the actual value of the opposition, while they looked only to the value to them of getting it out of the way. This is sworn testimony, and on record in the Superior Court, to be proved by anyone.

ANOTHER absurd "marriage" by telegraph took place at Jacksboro'—appropriately named—Texas, on the 6th of December. The bride and groom were at Fort Sill. As no person authorized to tie the knot is in that vicinity, the couple had recourse to the wire. County Judge Jones pronounced the words, and Lieut. W. A. Glassford, of the United States Signal Corps, who is there en route to Denver on a tour of inspection, transmitted the lightning that was supposed to unite the notoriety-loving pair.

It may be interesting and profitable for the managers of the Mutual Union and other opposition lines to reflect upon the great advantages of co-operation between telegraph and railroad companies. Dr. Green said in an interview recently that, strange as it might seem, his (the Western Union) company paid the wages of less than one thousand offices, although it has a total of eleven thousand offices, the remaining ten thousand being paid by the various railroad companies along whose tracks the wires run.

THE consolidation of the *Evening Mail* and *Evening Express*, of this city, gives Mr. Cyrus W. Field control of a paper well worthy of metropolitan journalism. The vast energy and enterprise of Cyrus Field are too well known to telegraphers to need recital here, and if those qualities are directed toward his journalistic enterprise as generously as they have been bestowed upon his telegraphic ventures, there can be no question of the success of the *Mail and Express*.

WHEN the telegraph wires were recently run through the sewers of the city of Washington it was claimed by many that the vexed question of subterranean telegraphy was settled. The plan has, however, failed, and the District authorities have directed their removal from the sewers. It was found that they retarded the flow of water by gathering and retaining matter, which stopped up the sewers.

THE President's message, containing 14,935 words, was sent over the Western Union wires this year, from Washington to New York, in 58 minutes, copies being dropped at Baltimore and Philadelphia. Twelve single wires were used. This is quick work, while the admirable style in which the operators turned out the copy makes it doubly creditable to the company.

It was rumored recently that the Mexican Government was about to establish a new Cabinet office, to be called the "Ministry of Communications," and to have cognizance and supervision of railways, telegraphs and the mails. The idea was scouted, however, even in Mexico, so that we anticipate short shrift for such a proposition in this country.

THE San Francisco telegraph college, which commences its advertisement with a Scriptural quotation—"their line is gone through all the earth"—may be set down as a pious fraud. They have probably not noticed the sarcasm in the synonymous phrase, "Their lyin' is gone through," etc.

ON the 30th ult. a Mutual Union wire was worked direct from this city to Chicago without repeaters.

WE wish all our readers a very merry Christmas, and many happy returns of the day.

WESTERN UNION stock is quoted at 86¾. Last issue it was 85½.

## Important National Capital Matters Discussed.

### To the Editor of the Operator:

SIR: A petition signed by every man on the day force was this morning handed to Manager Whitney. The signers petitioned for a decrease of Sunday labor, quoting that religious and civic law have declared that Sunday should be a day of rest. "Six days shalt thou labor and do all that thou hast to do," and the Operators contend that this great command should hold good with the Western Union Telegraph Co., unless they are "inspired by the Deity" to change this commandment.

After setting forth their grievance, the petition closes with the following: "We, the undersigned telegraphers of the day-force, regard Sunday work as a hardship, and do most earnestly and respectfully petition you to reduce it to the very lowest minimum, and that every member of the force thereof be obliged to perform his portion of the work."

According to the above, there are some men who are excused from Sunday work, and this petition appears to ask that no partiality be shown. Truly a just proposition, and one that should have immediate notice. I wish the gentlemen success.

I understand that the management opine that this petition emanated from the officers of the Brotherhood, or, rather, is an outcome of that organization. But your correspondent can assure those worthy gentlemen that this most excellent petition, although signed by many of the "circuit," is altogether outside of that organization, and is somewhat foreign to their views of "fixing" Sunday labor. The Brotherhood hold that men should be paid extra on Sunday, and at one of their late meetings a resolution was unanimously adopted, and "hit goes sumn like dis:" "Resolved, That where Sunday labor may be necessary it should be considered and compensated for as extra service."

As the Washington "circuit" of the "Telegraphers' Union" is not a secret affair, I was allowed to peep at their constitution the other day, and received permission to quote from it. Herewith the object:

"The purpose of this circuit shall be the improvement of its members by industry, economy and co-operation; also a full protection of their interests; the providing of a fund for the benefit of its members in time of sickness, accident or loss of employment, and to assist in defraying their burial expenses in case of death; also making a vigorous and persistent effort to prevent the wholesale teaching of our art."

I predict that an organization with the above principles in view will surely succeed. It should reach and have the support of every commercial telegrapher in the District, as it not only offers a full protection to its supporters, but, better than all, charity. I will quote a chapter on "benefits."

"The chair shall be empowered, on being notified of the necessity, through sickness, accident or loss of employment as the result of affiliation with this organization, of any member of the circuit, to order such assessment *per capita* as shall net to such sick, suffering or discharged member a sum of not less than eight dollars per week. Provided: It be not possible to secure the salary of such member by the filling in of his time by members of this Association, each and every one of whom shall consider himself bound so to do when such course shall be found practicable. Upon being notified of the death of a member of the circuit, it shall be the duty of the chairman to order such assessment *per capita* upon all members of the circuit as shall enable the Secretary of the circuit to place at the disposal of the nearest surviving relatives or heirs of the deceased member the sum of fifty dollars."

Reader, have you ever heard of a beneficial association on such a basis as this? So broad, so simple, so full of charity? Do you know, Mr. Editor, of any other aid association that will guarantee its members full salary when sick or disabled? Here is a party of men who unselfishly pledge themselves to "fill in" their brothers' time—to give him his full salary in times of trouble. They do not even limit the period of benefits. They simply declare to "fill in" the member's time when practicable, be it one or fifty-two weeks. This is an entirely new phase

of aid associations, and, if successfully carried out, it will enable them to say with the prophet of old: "Behold how pleasant a thing it is for brethren to dwell together in unity"—to labor together in love—a protective association, indeed!

The chapter on vacancies is entirely new, and, no doubt, will be adopted by other branches of the "union."

"Vacancies existing in this circuit shall be reported at the regular meeting. The circuit, after a full and free discussion, shall then decide upon the salary its members shall accept in filling said vacancies. The decision then rendered shall be final. The Secretary shall report the vacancy or vacancies, also the report of the circuit decision, to all other brotherhoods of the "Telegrapher's Union."

The Association does not dictate terms to any corporation. It does not seek to foster strife. It merely guarantees to furnish operators at a fair salary. Of course it strikes against reduction of salaries, and the Western Union Telegraph Company has been reducing salaries steadily for years, and is still at it. Every now and then there is a great ado about men having their salary increased. Upon investigation, perhaps you may find that one or two operators have had a paltry increase doled out to them, and while at the same time a half a dozen new men have been brought in, filling vacancies at ten to fifteen dollars per month less than the retiring operators received. This is not increasing salaries. So I contend that the Western Union Telegraph Company has never increased our salaries. No, Never! (Ah! my smart critic, I got ahead of you that time.) But this vacancy article, adopted by the Washington Circuit, strikes at the root of this salary system. It is a true remedy, as it prevents the members from accepting a position at less salary than his predecessor received. All our honest writers admit and prove this steady reduction of salaries. "Justitia," in THE OPERATOR of Dec. 1, says: "Although the officials of the company claim that they are not reducing salaries, they have been doing so for years past, in pursuance of this unjust policy of filling vacancies by promotion from lower grades without a corresponding increase of salary, so that a promoted operator doing the same work as his predecessor, seldom or never succeeds in getting the same salary." I, therefore, recommend the adoption and carrying out by the fraternity of the article the Washington circuit have so unanimously adopted. "Justitia" also urges us to organize. Right you are, Justy. But, old fellow, when you join us, I pray thee do not forget the vacancy chapter. It will "fit" you. "You'll like the paper on de vall." In fact, the vacancy idea was conceived by a paper hanger.

Of course it is patent to all that telegraph management can look elsewhere, can go outside of the organization for help, and the "circuit" have no right nor will they offer the least hindrance to this, but, rest assured, telegraph companies cannot engage a member of the "Union" at a less figure than fixed upon by the Washington branch. Then, again, corporations or private lines can secure better talent from an organization of this kind. The operators are far more able to judge of a man's ability than the managers or superintendents, and know exactly what salary to name for every member they have.

An enthusiastic member said to me the other evening: "We have classed our men and are now open for engagements, who will be the first to engage us? Can furnish anything you desire, from a switchboard manipulator down to a check-boy."

The following has a prominent place in the "circuit's" by-laws: "That no member shall be allowed to teach our profession, except to the brother or sister of a member; and all members are required to discourage others from so doing for a period of five years from the adoption of these by-laws."

Several years ago the paper hangers adopted something similar to the above resolution and today they name their wages, the old labor problem of supply and demand making itself felt. Herein lies the telegraphers' success, stop this radical evil of "plume" teaching and we shall conquer. I wish some good fairy would show the operators where their folly will land them—this teaching of their intimate friends (?).

Our wide-awake champion, THE OPERATOR,

has the heartfelt thanks of the Washington telegraphers for noticing in its columns the complaint in regard to government clerks who work in the W. U. office, and I am pleased to learn that the fraternity at large are taking notice of this injustice. The operators also vote Gen. Hazen an honest man for his attempt to break up this evil by withdrawing the signal operators, Field and Painter. If the General had his way, these men would not bother the W. U. operators much longer. But rumor says that Secretary Lincoln was waited upon by the management and induced to return these men to the Western Union office, where they, with three other government employes, are now engaged in the great "salary-grab" game, giving out the old "Boss" Tweed boast: "What are you going to do about it?" These government fellows say that they can work here as long as they wish, whether regular operators remain out of positions or not. Already several men have been refused positions in this office on account of this radical injustice. There was an operator refused a job to-day, and he only asked for extra work.

If this be true, that the company begged the government for their operators, and we infer it is by their distasteful presence in the office; it shows that the company are lamentably weak; that they find it very difficult to get first-class help without offering fair wages; and this fact the brotherhood should not fail to note. One of the boys says that it wouldn't surprise him to see "Bobby Lincoln and the Chinese Minister down here working one side of a quad."

Suppose we see who these government men are, and the salary they receive per annum from Uncle Sam, also from Uncle Gould. Herewith the list:

	Gov't.	W. U.	Total.
Whepley.....	\$1,800	\$1,020	\$2,820
Braulik.....	700	1,100	1,800
Fields.....	1,100	1,100	2,200
Painter.....	1,100	1,100	2,200
Concannon.....	900	1,100	2,000

What think you, brothers, is a government clerk's lot a happy one? You will notice that Braulik receives the lowest government salary on the list, but he only works seven months out of the twelve, with the "daddy" hours from 10 till 3. All these government employes have easy hours.

I will take at random the names of five first-class W. U. men, also giving their regular salary per annum and the extra money they make by working many weary hours of overtime:

	Salary.	Extra.	Total.
Mr. Thos. Maddux.....	\$960	\$250	\$1,210
Mr. Robt. Deakers.....	900	240	1,140
Mr. C. L. McArthur.....	960	250	1,210
Mr. Adams.....	900	240	1,140
Mr. Van Emborg.....	700	200	900

You will see (notwithstanding that comparisons are odious) that the regular salaries paid by the government are almost equal to, and in one case exceed the combined regular and extra work of the Western Union men, not taking into consideration the long hours of the W. U. men during their regular trick; and at the same time these men are keeping other Western Union operators from obtaining positions in the Washington office, and also preventing the regular force from an increase of salary that a shorter force would necessitate. Oh, that a telegraph "crank" would show up in Washington office with that inspired word of "Removal!"

When members of trades unions are out on a strike, the men, or rather the tramps, who come in and take their places are designated as "rats." I wonder by what name we should call these well-fed fellows who swoop down upon us with such itching palms. Name them, "Justitia."

Quite a sensation was created the other day by the following mysteriously appearing on the office blackboard: "Gen. Hazen, Chief of the Signal Bureau, has issued an order making the day's work from 8 A. M. to 5 P. M. It has been from 9 A. M. to 4 P. M. The change is necessitated by the pressure of work." And attached was this sarcastic query: "To what office does this refer—Western Union or Signal office?"

As Denny Harmon would remark, "You had 'em there." Our jolly Chief Bender ordered the signals down, thirty all around.

Some one writing you an account of the Long Branch and Cleveland trip signed himself "Fairplay." Allow me to subscribe myself

FAIRPLAY ENCORED.

The Associated Press wire between New York and Washington has been quadruplexed, with repeaters at Philadelphia and Baltimore.

## Boston Notes.

To the Editor of *The Operator* :

SIR: The President's message was received over four wires from New York, within the space of two hours. The feat was not marked for its rapidity so much as for the excellent manner in which it was turned out.

Considering the fact that it had to be pushed through 11 sheets of manifold, the copies were everything that the compositors could wish for, and that is a great deal. Messrs. Hennessy, McCarty, Finan and McMahon took the message here. Messrs. Kelly and Dickinson, of this office, went to Worcester to receive the message at that place.

Mr. C. W. Henderson is now acting manager W. U., with Frank Stevens and D. D. Devereux, chief and traffic chief, respectively. Business has fallen off somewhat, which, of course, is to be expected at this season of the year. Very few changes just now; everybody seems to have settled down for the winter. The practice of changing tricks from day service to that of night is carried on among the operators to a considerable extent, a privilege allowed by the management, and one greatly appreciated by those who are qualified to make such changes.

J. M. McLean, of Philadelphia, is here on night force. W. J. McClure and Jas. A. Dougher, of the day force, have also joined the "owls." Miss Hattie Partridge, who for the past twelve or fifteen years was manager of the ladies' department, resigned to accept a very nice position as operator for a prominent broker in this city.

U. KNO.

## Pennsylvania R. R. Operators' Pay.

To the Editor of *The Operator* :

SIR: In a paragraph in your issue of Nov. 15 you say the Pennsylvania Railroad pays its operators \$29 per month. This assertion is so sweeping in its character and so manifestly unjust to the Pennsylvania Railroad, of which I am a representative, that I hope you will allow me to correct the impression which is the natural outcome of such a statement. If there are any \$29 offices, they are vastly in the minority. In the majority of offices the salaries range from \$50 to \$70 per month, and operators have made from \$90 to \$100 by extra work. In most of the Philadelphia offices eight hours constitute a day's work. Promotions are the rule rather than the exception, many operators now holding positions which require experience and ability. The excitement and bustling activity incident to a busy railroad office differ materially from the monotonous routine of a commercial office. The Pennsylvania Railroad officials are men with broad and liberal ideas relative to the relations which exist between employer and employé. By furnishing passes to our distant homes and for other purposes, they show their appreciation of a desire to promote the interests of the company, and furnish us pleasure which in many other lines of business we would not be able to enjoy.

As a class the Pennsylvania Railroad operators will compare favorably, in point of intelligence or gentlemanly deportment, with any similar body of employés. However, if any one feels like shedding a tear over our forlorn condition we would say affectionately, "let it drop;" but wish it understood that we will not lie awake at night should we not be the recipients of such favors.

HAWKEYE,

Signal Service, P. R. R.

PHILADELPHIA, Dec. 10, 1881.

## From the Organ of the Trade.

W. J. Johnston has just issued an illustrated edition of the "Poems of William Wordsworth," edited with an introduction by Richard Henry Stoddard. Of Wordsworth and his poetry, and the scope which it offers to the artist's pencil, we need not say a word. As the world grows older, the poet, reflecting the tastes and tendencies of his time, draws nearer and nearer to nature, and the poetry of Wordsworth is better appreciated now than when he first gave it to the world. Artists, too, have stopped painting gods and dragons and battles, and now study nature in all her simple but beautiful phases. Wordsworth's touching word pictures furnish to the artist an unlimited field. In the present volume, the wood cuts, of which there are more than sev-

enty, are excellent interpretations of the poet, and they add much to the force of the verse. The book is a square octavo, printed in clear, large type, on heavy and beautiful paper. It will make a most acceptable holiday gift.—*American Bookseller*.

## TELEPHONE DEPARTMENT.

The authorities at the Vatican have rejected an application to put a telephone in that place.

Greece now has the telephone, established between Athens and the Piræus, for the service of the War and Navy ministers.

The Philadelphia *News* says: "Always beginning a conversation through the telephone with 'Hello,' must be a good rule, for it works both ways. The average man first yells 'Hello,' and then, when he can't hear anything but a buzz, reverses the word."

The Bell Telephone cases await the decision of the Examiner of Interferences, which is promised in a few days. The Examiner thinks it will take at least two weeks longer to look over the evidence submitted in the recent examination, which is quite voluminous.

The Cheshire County Telephone Co., of Keene, N. H., has a No. 14 steel telephone line 35 miles in length, equipped with 15 of Charles Williams, Jr.'s No. 1 magneto bells, which, the manager says, "work to perfection. We can ring all the bells from either end up sharp, and can talk over the line as distinctly as over any line I ever saw. We invite inspection."

A Cincinnati man, about to raise a telephone trumpet to his ear one day recently, was startled to see a flame leap from it to the height of six inches. The operators at the central office witnessed a similar startling effect, it being caused by the telephone wire coming into contact with an electric lighting wire. The wires of both parts of the telephone instrument were destroyed.

The certificate of incorporation of the Tropical American Telephone Company, limited, has been filed in the office of the County Clerk at Freehold, N. J. The incorporators are Frederick M. Delano, of Detroit, Mich.; James H. Howard, of Boston, and James B. Richards, of New York. The object of the company is the construction and operation of telephone lines and exchanges in the several cities, towns and villages in the West India islands (excepting those of Cuba), Central America, Panama, Venezuela, United States of Colombia, British, Dutch and French Guiana.

Articles of incorporation have been filed for two telegraphic and telephonic companies with headquarters in Ogden, Utah. One company is known as "The Wyoming Telegraph and Telephone Company," with J. J. Dickey as President, L. H. Korty as Vice-President and C. F. Annett, Secretary and Treasurer. These officers are all residents of Omaha. The other company is "The Idaho Telegraph and Telephone Company," with the same officers except that A. J. Pattison, Manager W. U., Ogden, is Secretary and Treasurer. The object of these two companies is that of operating telegraph and telephone lines throughout Wyoming and Idaho Territories. The capital stock of each is placed at \$50,000, in shares of \$100 each.

## DASHES HERE AND THERE.

Electric lights have been introduced at Amherst College.

A telegram from Shanghai, on the 2d inst., says that the telegraph line from Tientsin to Shanghai has been completed.

If you want to become a telegraph operator, send 25 cents to C. E. Jones & Bro., Cincinnati, O., for best illustrated instruction book.—*Advt.*

The electric light is fast superseding gas in Montreal. On the evening of Dec. 10 for the first time a great many large stores were illuminated by it.

During the three months of the Electrical Exhibition at Paris the electric railway from the exhibition building to the Place de la Concorde carried 84,000 passengers.

The Blanchard Prepared Liquid Foods for Dyspeptics aid digestion and restore the natural

functions. Explanatory pamphlet, free. The Blanchard Manufacturing Co., 27 Union square, New York City. *Advt.*

The land section of Mr. Jay Gould's second American cable was laid off the coast of Cornwall, England, on the 9th inst. The Chevalier Giovanni Purissimo Morosini is Treasurer of the company.

The London *Standard*, in its financial article of Dec. 12, announces that fresh competition in telegraphic communication with America and India may be looked for from a new company to be launched next month.

Mayor King, of Philadelphia, is so well pleased at the results of lighting a portion of Chestnut street, in that city, by electricity that he wishes the system introduced throughout all the large thoroughfares of the city.

The telegraph office at Anaheim, Cal., was burned about Nov. 15. The lady operator, who had rooms in the same building, was fortunately absent for the night, but suffered the loss of her wardrobe and other personal effects.

Sufficient capital has been found to support a permanent electric railway in the French capital. Plans have also been drawn up for an elevated electric railway around the city of Paris, and Mr. Siemens is considering them.

The Blanchard Prepared Liquid Foods for Dyspeptics aid digestion and restore the natural functions. Explanatory pamphlet, free. The Blanchard Manufacturing Co., 27 Union square, New York City. *Advt.*

The Mutual Union Telegraph Company intend opening offices at Sandy Hook, Fire Island and the Highlands, for the reporting of vessels off the points named. The arrivals will be promptly bulletined to the government offices in this city, and afford rapid information of the foreign mail steamers.

On Monday, the 26th inst., and on Monday, Jan. 2, Western Union office hours will be from 8 to 10 o'clock A. M., and from 4 to 5 o'clock P. M., except at repeating stations and principal offices, which will be kept open as usual, but with such reduction of force on duty as circumstances will permit.

*Managers and Operators* suffering from paralysis, or writers' cramp, will do well to send to Brown, Pettibone & Kelly, Stationers, 194 and 196 Dearborn street, Chicago, for circular and treatise of Farnham's Armaline. It will give immediate relief. Testimonials received from all parts of the country.—*Advt.*

An attractive half-page advertisement of the Electrical Supply Company will be found in the present issue. This company does a large business in insulated wires, cables and cords, telegraph, telephone and electric light supplies, and the like, and has recently issued a new price list, which will be mailed free on application.

A California correspondent, in writing about the "Union Electric Telegraph Instruction Company," and reviewing its circular, asks: "If 'Prof.' Henry C. Roeth has the 'influence' he claims and operators get such good salaries for so little labor, why don't he himself go into the legitimate business of operating? Will he please rise to explain?"

On the evening of Friday, Dec. 2, Chestnut street, Philadelphia, was illuminated for the first time with the Brush electric light from the Delaware to the Schuylkill rivers, a distance of 2½ miles. The illumination has continued satisfactorily every night since, and the Mayor is so well pleased with it that he will recommend its adoption on other thoroughfares.

The stockholders of the International Ocean Telegraph Company elected the following Board of Directors on the 5th inst.: Norvin Green, Augustus Schell, Harrison Durkee, Edward S. Sanford, Moses Taylor, James O. Green, Roswell H. Rochester, Robert C. Livingston, Jay Gould. A dividend of 2 per cent., payable Dec. 31, was declared. The transfer-books will close Dec. 24.

At Manchester, England, on Nov. 18, a man named Watson was committed to the assizes, charged with inducing a telegraph operator to reveal to him the contents of sporting telegrams. The prisoner was seen to pick up a piece of paper, thrown to him out of a window in the telegraph office, and on being examined it was found to contain information respecting that day's racing at Aintree, near Liverpool.

Our New York contemporary, THE OPERATOR, has issued a special number for Nov. 1, which consists of thirty-six pages. It says much for the interest taken in telegraphic matters in the United States that our contemporary should be in a position to print and publish such a number, and we congratulate THE OPERATOR on its enterprise. Our opinions do not always accord with those of our contemporary, but we wish it all prosperity nevertheless.—*Electrician*.

The old and reliable Blanchard Prepared Foods for Dyspeptics are made under the supervision of an eminent physician, and from certain selected vitalizing elements contained in the three great life staples—beef, wheat and milk—carefully and specially prepared to meet all conditions, from the weakest to the strongest. No stomach too weak to digest these foods. Lady in attendance to give ladies full information. Write for free explanatory pamphlet or call. Don't fail to investigate. The Blanchard Manufacturing Co., 27 Union square, New York City, N. Y. *Advt.*

The Rhodes electric gas lighting burner, advertised in this issue, deserves the attention of electricians and others interested in this subject. The burner is as simple as it is ingenious. By merely pressing a button the gas is instantly turned on, and by depressing another button it is turned off. By attaching the wires to the doors and windows, moreover, and setting them for that purpose, any attempt to enter the house by burglars will be immediately followed by the sudden lighting of the gas. Mr. Rhodes has just got out an 8-page circular explaining the operation of the burner. Copies of the circulars will be mailed free.

William Hendrey Cameron, of Providence, R. I., has filed a bill in equity before Judge Blatchford, in the United States Circuit Court, this city, against the Mutual Union Telegraph Company, asking that it be enjoined from issuing its capital stock in accordance with the company's present plans. Mr. Cameron claims to be the owner of 75 shares of stock of the original capital of the Mutual Union. The stock, it is alleged, was bought in good faith in the open market and at the full market price. It was bought when the capital stock of the company was \$600,000, divided into 6,000 shares of \$100 each. Subsequently the capital stock was increased to \$10,000,000, in selling which the company gives with every bond sold a share of stock as a bonus—that is, a cash investment of \$10,000 secures \$10,000 in bonds and with the bonds \$10,000 in stock. The answer of the Mutual Union Company to Mr. Cameron's complaint will be that he is guilty of false representation. Not a share of the original \$600,000 of stock has been put upon the market. It is now, and always has been, locked in the Mutual Union safes. Secretary Peck, of the Mutual Union, says that the suit is simply a move made by the Western Union Telegraph Company. "I knew ten days ago," said Mr. Peck, "that Erastus Wiman, as a Director of the Western Union had secured the services of Cameron, and that this suit was to be brought."

## NEW YORK CITY ITEMS.

### Echoes From 195.

Geo. Cumming and Billy Blanchard are the champion sneezers on the night force.

An advertisement of board with a desirable family on Brooklyn Heights, to be found in this issue, deserves the attention of telegraphers of this city on the lookout for such accommodations.

Owing to the unprecedented increase in the number of wires, another addition to the switch has been built for the city and L. I. circuits. The present crowded appearance of the office is hardly to be recognized as the same barn-like place of 1875.

The operating room was well ventilated on the day of the last issue of THE OPERATOR, but the following day things were as bad as before. There should be some systematic plan for ventilating this immense and crowded room. When the plan has been agreed upon by the proper authorities, grumblers should submit or move their location.

It is rumored that the Gold and Stock has been entirely absorbed by the Western Union. "It is to be hoped," says a correspondent, "that

the rooting-out plan so energetically adopted and carried out by Gen. Eckert since his accession to the general management will be continued in these premises, where there is such a wide field for reform and curtailment."

The Associated Press rooms are getting to be quite a telegraphic centre. Besides the Eastern, Western and State wires which have been worked there for some time past, the regular Washington and Philadelphia circuits have now a separate room. Three new quad tables have been put up, and a number of new men added to the force, among the number our old friend Mr. R. B. Emerson.

One of the accessions to the night force is Dr. Henry V. Warren, who, having taken degrees in two Western colleges, has come to the Metropolis to accept its advantages for study and observation. As a telegrapher the doctor has few equals and no superiors, and his urbane manner makes him at once the favorite of all. He has fitted up an office at 36 Great Jones street, where he practices the arts of his profession.

Mr. Charles T. Smith, who has been for some years past in charge of the W. U. lunch room, is one of the oldest telegraphers living, he having been employed on the first experimental Morse line from Washington to Baltimore. Mr. Smith is a gentleman of rare and versatile talents, being at once an electrician, an artist, a chemist and an inventor. Some of the first lines owed their successful operation to his careful construction and valuable suggestions, and many important improvements have had their birth in his inventive brain.

### Other City Items.

Mr. T. Wright, of East Albany, has been appointed operator at Fifty-ninth street, on the N. Y. C. & H. R. R. R., this city.

The American Rapid Telegraphers' Association will hold a complimentary reception at Caledonia Hall, Horatio street, on Friday evening next, Dec. 16.

A concert and literary entertainment is to be given at Tenafly, N. J., Dec. 2, at which we notice Miss Lottie Atwater, daughter of Manager H. H. Atwater, of the Continental Company's Wall street office, is to render two solos.

The American Electric Light Company met in this city Dec. 7, and elected the following-named gentlemen directors for the ensuing year: Elisha W. Andrews, Hon. Thomas C. Platt, Frederick D. Grant, Hon. William Windom, H. R. Garden, Edwin M. Fox, H. T. Jenkins, William Richardson and S. F. Moriarty.

At the annual meeting of the stockholders of the International Ocean Telegraph Company, which was held in this city Dec. 6, the following directors were elected to serve for the ensuing year: Messrs. Norvin Green, Augustus Schell, Harrison Durkee, Edward S. Sanford, Moses Taylor, James O. Green, Roswell H. Rochester, Robert C. Livingston and Jay Gould. A dividend of 2 per cent. was declared, payable Dec. 3.

At the Dec. 21st meeting of the N. Y. Electrical Society, Chief Operator E. A. Leslie will read a paper on "The Stearns Differential Duplex and the Western Union Standard Quadruplex." This is a subject on which many of the members have desired information for a long time, and as Mr. Leslie will enter into details and make plain the intricacies of the multiple systems now in use by the Western Union, the attendance ought to be large.

Miss Ella Gartlan, of the Spring street office, Metropolitan T. & T. Co., this city, made 695 connections on Nov. 23. This is the largest number ever made by a single operator in this office in one day. A twelve strip table is used, and an average of six hundred connections is made daily. The Spring street is the banner office of the district. Mr. Sam'l B. Van Nortwick, a well-known ex-telegrapher, is manager, to whose skill and the efficient corps of lady operators under his charge is due the credit for the excellent manner in which business is attended to and satisfaction given to subscribers.

At the meeting of the Board of Aldermen on Tuesday last, Dec. 13, Alderman Cavanagh called up the Mayor's veto of the franchise given to the Metropolitan Telephone and Telegraph Company, permitting it to lay wires and apparatus

under, over, through or on the streets of the city for the nominal consideration of one cent per foot of street used. The Alderman moved its adoption notwithstanding the Mayor's veto. Alderman Hawes made a vigorous speech in opposition to the resolution, and stated that the company owned a controlling interest in all the other telephone companies in this city, was a big and dangerous monopoly, and ought not to be given such a sweeping franchise for a merely nominal compensation. The Alderman's speech was useless, however, for the resolution was adopted by a vote of 16 to 6.

135.—This office is but the skeleton of what it was a year ago, when the American Union was at its best. Then the time-roll showed 150; while to-day it contains but 35 names. Mr. Dealy is a frequent visitor, and seems to take pleasure in greeting the few of the old force that still remain here. Conrad A. Myer is manager and George Stainton chief operator. These gentlemen, it will be remembered, were elected by the operators of the office second and third assistant chiefs, respectively, and have succeeded to their present positions through regular promotions in the office. J. Barnard Quinn and Joseph O'Leary are the more recent transfers to "195;" also, Miss J. Kearnan. Charlie Hanson and John Dempsey have secured good positions with the Baltimore & Ohio in this city. They were formerly in Fulton Market office; more recently here. G.

The annual meeting of the Gamewell Fire Alarm Telegraph Company took place at the executive offices of the company in this city, on Tuesday last, Dec. 13. The reports presented showed the financial condition of the company to be in a prosperous condition and the outlook encouraging. A dividend of two per cent. was declared—one per cent. payable Jan. 1 and one per cent. April 1. This is the first dividend thus far paid by the company. An animated discussion took place on the subject of infringements, and resulted in a unanimous resolution that all infringements upon any of the patents controlled by the company should be vigorously prosecuted. The following officers were elected for the ensuing year: Jos. W. Stover, President; Joseph Kinsey, 1st Vice-President; Chester H. Pond (of the Pond Indicator Co.) 2d Vice-President; Otis T. Pettie, Treasurer; John N. Gamewell, General Superintendent; and B. S. Clark, Counsel. The Board of Directors comprise the President, 1st and 2d Vice-Presidents, General Superintendent and Counsel; also, Messrs. Moses G. Crane, of Boston; E. V. Cherry, of Cincinnati; C. D. Haskins, of the Union Electric Mfg. Co., New York; Mr. Tenney, J. F. Miller and Judge Fisher.

## PERSONAL.

Ned Pearson is Western Union operator at Willcox, Arizona.

General Superintendent R. C. Clowry has been paying a visit to his old home, Omaha.

Mr. W. S. Hooper, agent at Colton, Colo., has just returned from a pleasure trip to the East.

Mr. G. Q. Stewart, formerly of Los Angeles, Cal., is now manager of the Western Union office at San Jose.

Mr. A. E. Vandercook, formerly night operator L. E. & W. R. R., Paxton, Ill., has been transferred to Tipton, Ind.

The irrepressible Bogardus has turned up in San Francisco. It is reported that he contemplates an extensive pedestrian tour southward.

Messrs. Kendall and Gray, of Marysville and San Buena Ventura, respectively, are the latest additions to the force of the Los Angeles (Cal.) office.

By the death, at Utica, N. Y., on the 30th ult., of Theodore S. Faxton, the telegraph loses one of its earliest friends and admirers. Mr. Faxton was 87 years of age.

The Los Angeles W. U. office is now under the management of Mr. R. R. Haines, one of the Argonauts of telegraphy upon the Pacific Coast, and a deservedly popular gentleman.

Mr. B. A. Worthington, who filled temporarily the position of chief operator at Los Angeles during Mr. Sherer's absence in the East, has returned to his first love—Sacramento.

Mr. McGlashin, editor of the Santa Barbara

Press, comes forward with an invention, by means of which he hopes to be able to make it possible to telegraph from a train in motion.

Mr. John Barry has been appointed manager of the Grand Transverse, Mich., W. U. office, vice S. C. Fuller, resigned. Mr. Barry has for some time been employed as operator in the same office.

Although the marriage of Mr. Shelley, of the Albany W. U. office, was private, he was the recipient on the occasion of many elegant and costly presents from the host of friends by whom he is held in high esteem.

At Rutland, Vt., Night Operator Murray took the entire President's Message at one sitting, lasting from 2:30 in the afternoon until 4 in the morning. The local papers say the "copy" was accurate and legible throughout.

The operating force at Colorado Springs, Col., consists of Geo. A. Bosworth, manager, and E. H. Betts, late of Denver, night-report man. Mr. Bellmaine, late of the Colorado Springs office, has accepted a position east.

Mr. Lewis B. Foley, of New York, has been appointed Superintendent of Telegraph on the Delaware, Lackawanna & Western Railroad lines. Mr. Foley has long been associated with the company, and his appointment meets with hearty approval in all quarters.

The New Bedford, Mass., W. U. force consists of: Geo. S. Hoyt, manager; H. C. Balles, night press operator; R. C. Crapo, day press operator; J. P. Taylor, operator; E. E. F. Potter, clerk; T. F. Kavanagh, operator at depot, and Wm. A. Gidley, operator at Parker House.

We are pleased to have to record in this issue the marriage of Mr. W. D. Scott, of the cable staff at North Sydney, C. B., to Miss Belle Moffatt, the young lady who bravely rescued Mr. Scott from the water last fall, after he had fallen through the ice while skating, as noted in THE OPERATOR at the time.

Gen. C. Henry Barney has resigned his position as manager of the Inter-State Telephone Company to accept the position of General Superintendent of the Metropolitan District Telephone Company of New York and New Jersey. Gen. Barney also held the position of Adjutant-General of the State of Rhode Island and was Councilman-elect of the Ninth Ward of Providence. Both of these offices he, of course, had to resign. He expects to assume his new duties about Jan. 1.

EASTERN RAILROAD.—The operators of this company gave a ball last season as an experiment. It was so pronounced a success that they have decided to make it an annual affair. The second annual ball will be given at Monument Hall, Bunker Hill District, Boston, on Friday evening, Jan. 13, 1882. A cordial welcome is extended to all members of the profession. Mr. H. M. Forristall, who contributed so largely to the success of last year's party, will be present in the position of floor director.

By a contract recently completed, the Western Union secured control of the lines and offices of the Pensacola Telegraph Company, a local organization reaching all important points in Escambia and Santa Rosa counties, Florida, of which Mr. C. L. Le Baron is President. Mr. L. Le Baron, a well-known and efficient telegrapher of the Pensacola Company succeeds Mr. E. F. Walker as W. U. Manager at Pensacola, Mr. Walker being retained as operator. A branch office has been established at Palafox wharf, with Mr. Ed. Gale Quinn in charge.

Col. T. P. Shaffner, of Louisville, a railroad and telegraph contractor, died of apoplexy in a Troy (N. Y.) hotel, on the evening of Dec. 11. Colonel Shaffner was editor of the *Telegraphers' Companion*, 27 years ago, and author of "The Telegraphers' Manual." He had also, if we mistake not, for some time before his death, been working on an exhaustive telegraphic work. Colonel Shaffner was a representative of the Grand Lodge of Odd Fellows from the State of Kentucky and from the United States. He introduced the present telegraphic system in Russia.

Relative to the shooting of Geo. L. Wentworth, on Thanksgiving Day, by Edward E. Nowell, operator B. & M. R. R., at Salmon Falls, N. H., referred to in last issue of THE OPERATOR, the Biddeford (Me.) *Union and Journal* gives the

following as the facts in the case: "Geo. Wentworth, who is uncle to Edward S. Nowell, had been acting rather wildly that day, and had drawn a revolver upon a man, but was prevented from using it. He finally went down to the depot, where young Nowell is employed as operator, and his father, E. S. Nowell, is agent. After the two Nowells had returned from dinner, Wentworth looked in at the window and made the remark to a by-stander that 'he had some business to transact in there.' Taking hold of his revolver he entered the depot and seated himself in a chair directly in front of the telegraph office, and entered into conversation with Police Officer Wallace. Shortly after, E. S. Nowell entered, and seeing Wentworth told the officer that he wished him taken care of, as he feared for the safety of his own life and the lives of his family. Wentworth immediately sprang from his chair, and drawing his pistol said, 'If that's your game, here goes,' and fired at E. S. Nowell, the ball lodging in the wall beyond, narrowly escaping Mr. Nowell. Wentworth instantly turned on young Nowell, pointing and cocking his revolver, but a ball from young Nowell's revolver prevented his shooting him. Wentworth was immediately seized by officers Wallace and Littlefield, and in the scuffle which ensued was shot in the neck by a ball from his own pistol. Wentworth was conveyed to his home in Dover, and at last accounts was improving. The Nowells are a peaceful and highly-respected family, and have at all times avoided trouble with Wentworth, but he has repeatedly assaulted them and they have been compelled to act on the defensive."

## MARRIED.

SCOTT—MOFFATT.—At North Sydney, C. B., Nov. 5, by Rev. D. McMillan, W. D. Scott, of the W. U. cable staff, to Miss Isabella Moffatt.

GREGORY—BAGLEY.—Nov. 24, 1881, in this city, by Rev. Dr. Deems, Ferdinand W. Gregory to Mrs. Caroline O. Bagley, widow of M. C. Bagley.

## OPEN JAN. 1,

For engagement as Superintendent or Manager of Telephone Exchange in any part of the U. S. or abroad. Prefer parties who have—or desire to operate—a first-class system. Competent to construct or repair apparatus. References exchanged.

P. CLARK,

52 Pearl street, Boston, Mass., U. S. A.

Save your eyes, by sending to R. & J. Beck, manufacturing Opticians, 1016 Chestnut St., Philadelphia, for a copy of their Illustrated Catalogue of Spectacles, Eye Glasses, Opera Glasses, Microscopes, Eye Shades, etc., containing full directions for fitting any one with proper glasses, and which will be

MAILED FREE TO ANY ADDRESS.

Mention this journal in writing to us.

## GOOD BOARD.

TWO SINGLE GENTLEMEN can find excellent board and all comforts and conveniences in a private house on

BROOKLYN HEIGHTS,

LESS THAN FIVE MINUTES WALK FROM FULTON FERRY.

The locality is an excellent one for telegraphers, being

ONLY 25 OR 30 MINUTES' FROM THE W. U. BUILDING.

## TERMS REASONABLE.

Office of THE OPERATOR,  
9 Murray St.

## THE FITCH CHLORINE BATTERY.

PATENTED SEPT. 16, 1879.

The cheapest, cleanest, most economical, durable and decidedly the

### Best Open-Circuit Battery

in use for Telephones, Annunciators and Electric Bells. After several years of constant use, it is pronounced to-day as being far superior in constancy and power to all other batteries for the above purposes, notwithstanding all statements to the contrary. We have made several valuable improvements in this Battery, among which is the substitution of a non-corrosive and adjustable clamp, in place of the old style lead cap, which warrants us in saying that the Chlorine Battery has no equal in the market, and all we ask is a trial.

Price, \$1.50 per cell.

Liberal Discount to the Trade.

Partrick & Carter,

Sole Agents and Manufacturers,

NO. 114 SOUTH SECOND STREET,  
Philadelphia, Pa.

## GREAT TELEPHONE BATTERY.

The Realization of

SIMPLICITY AND EFFICIENCY

### In Electric Open Circuit Batteries.

Free from acid. Emits no odor. Does not get out of order. Lasts without renewal from six months to several years, according to use.

#### ADOPTED AND USED BY THE

American Bell Telephone Company.  
Metropolitan Telephone and Telegraph Company.  
Western Union Telegraph Company.  
Gold and Stock Telegraph Company, with their battery telephones.

And by all the Telephone Companies and Exchanges in the United States.

The attention of the public is called to the new form of Leclanche Battery, in which the porous cell is dispensed with and for it substituted a pair of compressed Placques or Prisms, which are simply strapped to the Carbon (as shown in cut).

The Prism Battery is more easily and cheaply cleaned and renewed than any other battery. Beware of

Infringements and Worthless Imitations.

Every genuine Leclanche Battery has the words *Pile-Leclanche* stamped on the carbon head, jar and prisms. All others are spurious.

"Prism" and Porous Cell Batteries for sale in any quantity. Zinc and Sal Ammoniac of superior quality.

## BELL HANGERS' BITS.

ELECTRIC LIGHT LINE, WIRES AND CABLES; TELEGRAPH AND TELEPHONE WIRE; BRASS, COPPER AND GERMAN SILVER IN SHEETS, RODS, TUBES, PLATES, STRIPS OR RIBBONS, BOLTS, CABLES AND CORDS.

PRICE LIST FORWARDED FREE ON APPLICATION.

## RHODES' ELECTRIC Self-Lighting and Extinguishing GAS BURNER.

PATENTED MAY 31, 1881.

Adaptable to any place where gas is used.

The following are a few of the merits of the Burner:  
1st.—It is entirely automatic or self-acting; at one operation turning on and igniting the gas or extinguishing it.

2d.—Its ease of application to ordinary gas fixtures.  
3d.—Its simplicity of construction and arrangement; having no complicated parts liable to get out of order.

4th.—Its saving of gas; as no lights need be kept burning where it is in use; the mere pressure of an electric button lighting the gas wherever needed.

5th.—Its removal of a fruitful cause of fires by dispensing with the use of matches.

6th.—In dispensing with the ordinary ground-in gas cock, thereby avoiding friction and securing reliability and instantaneous action under the electric impulse.

## PARTRICK & CARTER'S TELEGRAPHIC SPECIALTIES.

### THE "LATTIG" [AUXILIARY LEVER NON-STICKING] KEY.

PATENTED AUG. 16, 1881. PRICE, \$5.00. BY MAIL.

This Key is very *finely finished*, nickel plated and presents a beautiful appearance; is easy to handle and WARRANTED NEVER TO STICK. It has been extensively tried and has received the *indorsement of the best operators* in the country. It embodies the only true principle to *prevent a key from sticking*, by having a great separation between the anvil and hammer (without increasing the play of the key lever), thereby preventing the formation of the "Electrical Arc" between the platina points, which is the PRIMARY cause of *sticking keys*. We claim this key will never fail to make contact.

### "THE EXCELSIOR KEY."

PATENT APPLIED FOR. PRICE \$2.50. BY MAIL.

This Key is made ENTIRELY of BRASS, nickel plated, with hardened platina points, and it is put forward to meet the long-existing demand for a CHEAP, LIGHT, EASY WORKING, FIRST-CLASS KEY, and is without doubt the CHEAPEST and BEST KEY EVER OFFERED FOR THE MONEY.

### The Giant Sounder Perfected.

Patented Feb. 16, 1875. Most perfect, reliable, clear-toned; fine finish, and warranted the best working sounder in existence. Price, by mail, \$5.00.

### Champion Lightning Arrester.

CUT-OUT AND GROUND SWITCH COMBINED.

Guaranteed the best and cheapest in the world. Price by mail, \$1.25.

### Premium Learners' Apparatus.

ONLY \$5.00.

Not the Cheapest, but Guaranteed the Best!

The PREMIUM LEARNERS' APPARATUS and OUTFIT comprises the famous "NEW GIANT SOUNDER, PERFECTED," and the "NEW CURVED KEY," placed upon a splendidly polished base, with a cell of Callaud Battery, Chemicals, Office Wire, and an excellent Book of Instruction, for \$5.00, when the money accompanies the order.

These instruments are the exact size and form of those upon which we received the highest award at the late Centennial Exhibition over all competitors. Everything reliable, and so guaranteed, or money refunded. Our Book of Instruction contains full and explicit information as to setting up the Battery, running of wires, etc.

Price, Complete Outfit.....	Money in advance, \$5 00

# A. G. DAY,

MANUFACTURER OF

## Kerite Insulated Telegraph Wire and Cables.

OFFICE: 120 BROADWAY, NEW YORK.

Factory: Seymour, Conn.

The discovery of the insulating compound, known as Kerite, is the result of more than ten years of uninterrupted experiment and application, as well as twenty years' previous experiment and experience in the manufacture of India-rubber. About ten years of this time was spent in assisting Mr. Charles Goodyear in the experimental department, while perfecting his improvement in vulcanized India-rubber and its varied applications.

The necessities of the telegraph business requiring an indestructible insulation, stimulated me to the discovery and perfecting of my compound known as Kerite, which combines the great advantage of durability with perfect insulation.

Kerite insulation is proof against the action of the corrosive elements in the earth, air and water; and, where it has been practically tested, has proved its superiority to all other insulation.

## DURABLE QUALITIES OF KERITE.

It is not injuriously affected by the extremes of heat and cold, experienced in our climate, nor by length of exposure in the atmosphere.

It will endure long-continued heat below two hundred degs. Fahrenheit, while for short intervals it may be subjected to from two hundred and fifty to three hundred degs.; and it may be safely immersed in boiling water.

The action of water, salt or fresh, not only protects all its qualities, but very much improves its insulation.

It is also unchanged by being placed in the ground. Any corrosive elements in the earth do not act upon it; nor is it injured by the roots of plants, which soon destroy gutta-percha.

There are thousands of miles in use throughout the country, by Fire Alarm and other Telegraph Companies of all our principal cities.

It has been used largely in the city of New York, under all conditions and exposures for the last nine years.

Constant exposure to the sun and atmospheric changes are the severest tests that can be given it in practical use.

## Eminent Electricians and Practical Telegraphists

commend and recognize the Kerite insulation as superior to all others.

At the Centennial Exhibition at Philadelphia, SIR WILLIAM THOMSON, the eminent electrician and scientist, awarded to the

## THE WORLD CHRISTMAS BOX FOR LITTLE FOLKS.

Twelve Articles, consisting of Toys, Games and Puzzles. Price by mail, **Fifty Cents**, Five Boxes for \$2.00. Get four of your friends to send with you, and your box will cost you nothing.

**2 FRENCH Dolls.**  
8 in. tall, 5 in. wide, 1 with Bangs and Black Eyes, and 1 with Curly Hair & Blue eyes different styled dresses with each, as a pattern for little ones to make dresses from.

**CAT.**  
An ornament for Mantles, Whatnots, Windows and Frieze-Braces. It is beautifully engraved on thick cardboard, 8 in. tall, 6 in. wide, it is so perfect that it is often taken for a Real Live Cat.

**The Great Pagoda Puzzle.**  
Is a new toy affording a delightful and fascinating pastime alike to old and young, made from one piece of paper and is impossible for anyone to make, unless instructed. Full directions with each box.

**The new automatic TOY.**  
Grandfather tossing on his knee the baby. By pulling a string the Head, Arms, Body and Leg of the Old Man move, and Baby's Body and Arms also. A very amusing toy for the children and a dangerous escort card, thus they furnish innocent amusement.

**Professor Abbey's Age and Flirtation Cards,** entertaining and amusing at Parties and Socials, enabling any one to tell the age of each one present, double faced on backs are directions; handkerchief flirtations and humorous escort cards, thus they furnish innocent amusement.

## MAGICIANS OWN TRICK CARDS.

These wonderful cards enable one to perform the most astonishing metamorphosis without deception with them, the self-same identical cards you show a light spots, all duces, all red spots, all black spots, &c., &c. Prof. Herriman's most astonishing performances revealed. Gives us all a chance to see how its done and the means of doing it. Full directions with each pack.

**THE SWISS WARBLER OR MOCKING-BIRD WHISTLE.**  
IT IMITATES EVERY SOUND IN THE ANIMAL KINGDOM FROM THE THRILL OF THE NIGHTINGALE TO THE HOWL OF THE WOLF. You can raise a laugh or piercing cry of horror at pleasure.  
AFTER A LITTLE PRACTICE YOUR MOUTH WILL SEEM TO BE A COMPLETE MENAGERIE.

**THE \$100 Puzzle!**  
The greatest mystery out, \$100.00 was offered by the inventor to any one who could put it together yet it can be done by him in three minutes. The best puzzle yet invented. It consists of the alphabet in full and also forty-four figures. Is amusing and instructing.

**The New Mechanical Grasshopper.** Old Folks tickled and Children delighted, will jump six feet high. Peases the baby, astonishes the cat.

## GAME OF LOTTO.

(Lotto) Lotto is a Spanish Game and is very popular with the people of Spain and has become a fashionable pastime in England, France and America. It is easily understood and can be played by two or more not exceeding twelve. It has twelve beautifully colored cards and ninety numbers. The game is fascinating, amusing and very entertaining for young people. This game has been sold at forty cents, but superior facilities for manufacturing enables us to add it to the World Christmas Box.

The Articles in The World Christmas Box would cost Two Dollars if bought separately at the stores. It is the best bargain ever offered at **Fifty Cents**. Send Fifty Cents for trial box.

WORLD MANUFACTURING CO. 122 Nassau Street, New York.

  - "60" A SILVER WATCH.
  - "160" A GOLD WATCH.

Send in names and money as fast as received, which will be placed to your credit and can be added to at any time.

In view of the recent enlargement and improvement in THE OPERATOR, and the addition of the "National Portrait Gallery" and other new and desirable features, it is hardly necessary to assure the fraternity that in the future as in the past, our conscientious and earnest effort shall always be to FURTHER IMPROVE THE PAPER until it shall be just AS VALUABLE TO SUBSCRIBERS as MONEY, PAINS AND DILIGENCE CAN MAKE IT.

Those acquainted with the progress of THE OPERATOR are aware that—notwithstanding the extremely low subscription price—the paper has WONDERFULLY IMPROVED, especially within the past year. We believe, however, that DURING THE ENSUING YEAR it will be found very MUCH BETTER, MORE INTERESTING and MORE INSTRUCTIVE than at any previous time since it was established—so much so, indeed, as to be ABSOLUTELY INDISPENSABLE to those who desire to be kept informed on all telegraphic subjects, and wish to qualify themselves for promotion.

We offer VERY LOW COMBINATION RATES where one or more of our books are ordered in connection with the paper. When the order amounts to \$4.00 OR OVER, we allow A DISCOUNT OF NO LESS THAN 25 PER CENT. from the regular retail price. Intending subscribers should avail themselves of this combination offer, and thus secure such of our books as they shall desire at LOWEST WHOLESALE PRICES.

The success of THE OPERATOR depends in a very great measure upon telegraphers themselves. It is our earnest desire that the paper shall be as able, useful and influential a journal as it can be made, and to have it circulate, if possible, in EVERY TELEGRAPH OFFICE IN THE UNITED STATES AND CANADA. If you lend us your co-operation to this end, we shall consider it a great favor.

You can render us a service which we shall not be slow to appreciate, if you will assist us in increasing our subscription list, BY GETTING THE NAMES OF A FEW SUBSCRIBERS TO SEND US. The larger our list of subscribers, THE BETTER THE PAPER CAN BE MADE and the MORE INFLUENCE IT WILL HAVE. EVERY telegrapher should, therefore, take a PERSONAL INTEREST in extending its circulation.

## A MACNIFICENT WORK!!

# POEMS OF WILLIAM WORDSWORTH

Edited, with an Introduction, by Richard Henry Stoddard.

**320 Large Pages, Elaborately Illustrated. Cloth, Gilt Edges, Price \$3.00.**

Agents Wanted for the New Book, to whom we will allow liberal commissions.

"The Operator" for One Year and a Copy of Wordsworth will be Mailed Together, Postage Prepaid, for \$3.50.

"Tales and History," or any of our other \$1.00 Books, at the same Price—\$3.50.

"Wordsworth" and "Christmas Evergreens" together, both prepaid, only \$3.75.

"Tales and History," "Christmas Evergreens" and "Wordsworth," \$4.25.

"WORDSWORTH," "CHRISTMAS EVERGREENS," "THE AMERICAN POPULAR DICTIONARY," "TALES AND HISTORY," "WIRED LOVE" and "OAKUM PICKINGS," all cloth, prepaid, for \$5.00. With THE OPERATOR for fifteen months added, \$6.00.

"WORDSWORTH," "CHRISTMAS EVERGREENS," "TALES AND HISTORY," "WIRED LOVE," "OAKUM PICKINGS," "LIGHTNING FLASHES," "GENERAL GRANT," "THE AMERICAN POPULAR DICTIONARY," and "SAM JOHNSON," all bound in cloth, with "TELEPHONE AND OSHKOSH," paper—making an elegant telegraphers' library—only \$7.50. THE OPERATOR one year and above ten books, \$8.00.

A copy of "WORDSWORTH" will be mailed FREE to any one sending us orders for FOUR copies of the book at regular price; or to any one sending orders for any of our books, at regular rates, amounting to \$12.00, or for a club of 12 yearly subscriptions to THE OPERATOR.

**No. 9 MURRAY STREET, - - - NEW YORK.**

# THE LAW BATTERY.

THE GREATEST  
TELEPHONE BATTERY.

PATENT APPLIED FOR.

As a Telephone Battery, the "LAW" unquestionably excels all others, for the following reasons, viz. :

- 1st. The cost of renewing is about ten cents per year, as against more than one dollar per year for others.
- 2d. The cells are all exactly alike.
- 3d. They continue exactly alike.
- 4th. They never get out of order.
- 5th. The first cost is less than any other.
- 6th. The connections NEVER corrode.
- 7th. Every part of the battery is exposed to view, and if a fault exists it is instantly seen.
- 8th. The water cannot evaporate.
- 9th. The sal ammoniac cannot escape.
- 10th. The parts are not liable to break.

With the introduction of the "LAW," the objection to the use of a battery in connection with the telephone sinks into insignificance, for the care is nothing, of injury or interruption to the service there is none, and the cost of maintenance is less than one cent per month.

The battery is not an experiment; but an established fact.

It has been in use by the Law Telegraph Company for two years.

The materials used in its construction are the very best. No acids. No odors. Great recuperative power. Nothing to renew except the zinc and sal ammoniac—no porous cup, plaque or prism. Fits the standard size battery-box.

The Bell Telephone Co. of Missouri writes: "We have been testing the 'Law Battery' for several months in our telephone circuits, in competition with the various styles of Leclanché and Callaud batteries. For transmitter work the 'Law' excels all others in uniformity of action. As a result of the test referred to, we have concluded to adopt the 'Law.' We have upward of 250 cells now in use."

DIRECTIONS FOR USE.—Put in one-half pound of sal ammoniac and fill with water to the shoulder.

PRICE, \$1.25 PER CELL.

Manufactured and for sale by the  
**LAW TELEGRAPH COMPANY,**

140 FULTON STREET, NEW YORK.

WILLIAM A. CHILDS, Manager.

FRANK SHAW, Engineer.

# THE GAMEWELL Fire-Alarm Telegraph Company.

PROPRIETORS OF  
THE "OLD AND ONLY RELIABLE"

## AMERICAN FIRE-ALARM TELEGRAPH,

which has been in successful operation for more than a quarter of a century, and has been thoroughly tested and approved by

Over 110 of the Leading Cities in the United States and Canadas.

JOSEPH W. STOVER, Boston, President  
JOSEPH KINSEY, Cincinnati, First Vice-President.  
CHESTER H. POND, New York, Second Vice-President and Secretary.  
OTIS T. PETEE, New York, Treasurer.  
JOHN N. GAMEWELL, New York, General Superintendent.  
B. S. CLARK, New York, Counsel.

The GAMEWELL FIRE-ALARM TELEGRAPH COMPANY continues to contract with cities and towns for the construction of this

### Invaluable Adjunct of Every Well-Regulated Fire Department.

THIS IS THE ONLY

### PERFECT, COMPLETE AND RELIABLE SYSTEM of Fire-Alarm Telegraph in the World.

#### WHAT IS SAID OF THE GAMEWELL SYSTEM.

From a very large number of testimonials on file we select the following, as sufficiently evidencing the high estimation in which the American fire-alarm telegraph is held by those who have fully tested its practical working :

##### BOSTON.

I take great pleasure in adding my own testimony to the great value and success of the telegraph fire alarm; and I feel confident in saying that wherever once tried it will thereafter be deemed indispensable.

ALEX. H. RICE, Mayor of Boston [1856].

##### ST. LOUIS.

The superintendent of the fire-telegraph of St. Louis, in his report for 1860, says :

"A comparison of the two years' working of the department, prior to the establishment of the electric alarm, with the two subsequent ones, shows the following results : From April, 1856, to April, 1858, there were 568 alarms, of which 175, or nearly one-third, were false.

"The losses by fire during the same period show greatly in favor of the last two years. From 1856 to 1858 the amount of losses was \$1,803,315 against \$710,404 from 1858 to 1860, showing a diminution of \$1,097,911, or a sum equal to \$548,955 annually; and, on the principal that prevention is better than cure, we claim for the fire-alarm telegraph a large share of the credit in saving that amount."

##### TWENTY-ONE YEARS LATER.

The same official in his report for 1881 says:  
"In 1858, when the Electric Telegraph, as applied for fire alarm purposes, was in its infancy, the nucleus of the present system was introduced into this city. It was accepted by the authorities with considerable misgiving as to its practical utility, and it was looked upon generally as an experimental adventure, involving quite a sum of money. As time passed by, however, it gradually began asserting itself; skepticism as to its practical value faded little by little, until finally, guided by scientific research and mechanical improvements, it stands before the world to-day as being one of the most valuable achievements of man."

##### ALBANY.

In this city we would much prefer to have four steamers with the telegraph than eight steamers without it; and the same will hold good in any city. JAS. H. McQUADE, Chief Albany Fire Department.

The fire-alarm telegraph is in complete order, and has worked most satisfactorily during the year. In fact, it has never failed since its construction. It is a most valuable auxiliary to a fire department; for, in truth, without it, it would be unable to maintain the high degree of efficiency shown in our organization. Always reliable, the citizen feels assured that within a few minutes after the discovery of a fire the means will be at hand to extinguish it.—Report of Albany Fire Commissioners, 1874.

##### MONTREAL.

As the simplest illustration of its great value, we have the fires and loss for a fair average year, before and since its introduction.

Before, 85 fires.....	\$140,088 loss.
Since, 99 fires.....	35,428 loss.

A. BERTRAM, C. E. F. D. [1866].

The cost of construction will, of course, depend upon the amount of apparatus required and the extent of territory to be covered. But we have placed the prices of fire-alarm telegraph within the means of all towns, either large or small, willing to expend from \$500 upward to tell their Fire Department on the occurrence of a fire instantly and exactly where it is.

Full and detailed information given on application, personally, or by letter, to the Headquarters of the Company.

## The American Bell Telephone Company.

W. H. FORBES, President. W. R. DRIVER, Treasurer  
THEO. N. VAIL, General Manager.

This Company, owning the Original Patents of Alexander Graham Bell for the Electric Speaking Telephone, and other patents covering improvements upon the same, and controlling, except for certain limited territory, under an arrangement with the Western Union Telegraph Company, the Gold and Stock Telegraph Company, the American Speaking Telephone Company, and the Harmonic Telegraph Company, the patents owned by those companies, is now prepared to furnish, upon application, either directly or through any of its agents, Telephones of different styles, and applicable to a variety of uses.

This company desires to arrange with persons of responsibility for establishing

### District or Exchange Systems,

in all unoccupied territory, similar to those now in operation in all the principal cities in this country.

Responsible and energetic persons are required to act as licensees for the purpose of establishing

### PRIVATE LINE AND CLUB LINE

systems, for business or social uses. Also to introduce the telephone for

### SPEAKING TUBE

purposes, for which instruments will be leased for a term of years at a nominal rental.

This Company will arrange for telephone lines between cities and towns where Exchange systems already exist, in order to afford facilities for personal communication between subscribers or customers of such systems.

We respectfully invite attention to this matter, and any further information relating thereto can be obtained from the Company,

NO. 95 MILK STREET, BOSTON, MASS.

All persons using Telephones, not licensed by this Company, are hereby respectfully notified that they are liable to prosecution, and for damages for infringement, and will be prosecuted accordingly to the full extent of the law.
